524	Initial Letter	882

*** It is to be understood that the Wood-Cuts have in general been copied from drawings, sculptures, coins, or other works of the period which they are employed to illustrate; but, among so great a number of subjects, it has not been possible to adhere to this rule in every instance with perfect strictness. It sometimes happened that no suitable illustration of the custom or other matter described was to be found among the remains of the period under consideration; in a few such cases a drawing of a subsequent period has been made use of where there was reason to believe that it nevertheless conveyed a sufficiently accurate representation of the thing spoken of. An instance occurs at page 566, where in the Chapter on the Government and Laws of the Early Norman Period, the mode of granting lands introduced or practised by the Conqueror is illustrated by a drawing executed in the thirteenth century. In a few instances the age of the MS. is somewhat doubtful, and has been matter of dispute; but it is believed that no misconception as to any material point can be occasioned by the use that has been made of any authorities as to which such difference of opinion exists. The copies of modern historical pictures, it will of course be understood, have been given for other reasons altogether than their fidelity in regard to costume and other characteristics. An opportunity has been taken in the above List of correcting a few misprints in the titles or descriptions of the Cuts.

INTRODUCTORY VIEW

OF THE

ORIGINAL POPULATION AND PRIMITIVE HISTORY

OF

THE BRITISH ISLANDS.

NO question in history is more intricate and difficult than that of the original population of the British islands. The subject, indeed, in its various relations, is entangled with nearly all the darkest questions that perplex the primeval antiquities of our race. Every part of it has been a field of long and keenly waged controversy, where all the resources of learning and ingenuity, and, it may be added, all the license of imagination and passion, have been called forth in support of the most irreconcilable opinions and systems; and still there is scarcely a leading point in the inquiry that can be said to be perfectly established, or cleared from all obscurity and confusion.

Yet, almost in direct proportion to its difficulty, and the degree in which it has exercised and baffled speculation, the subject is interesting and tempting to a liberal curiosity. The connexion which it developes between the present and the remotest past—the extent of the space over which the survey of it carries us—the light, however faint and interrupted, shed by it upon that wide waste of the time gone by, which the torch of history has left in utter darkness—all combine to excite and lure on the imagination, and at the same time to give to the investigation much of a real utility and importance.

It will not be expected that we should here enter upon the more remote inquiries to which the subject, if pursued to its utmost extent, might conduct us; but it will be of importance to the understanding of much, especially of the earliest portion, of the history which is to follow, that the reader should, in the first place, be put in possession of the clearest views that can be obtained with regard at least to the immediate parentage of each of the various races which appear to have occupied, or made a conspicuous figure in these islands, before the comparatively recent date at which it commences. Even confined within the limit thus marked out, the investigation is beset with difficulties; and in pursuing it, we are frequently obliged to be satisfied with such probable conjectures as we are enabled to make when deserted by everything like clear evidence, and left to grope our way among a crowd of doubts and perplexities in the dimmest twilight. It may be of advantage that we should preface the exposition of the conclusions to which we have come, by a statement of the several sources from which evidence or conjectural intimations upon subjects of this kind, may be drawn; and of the general principles according to which our judgments ought to be formed.

1. The most obvious species of evidence, in regard to the events that have happened in any particular country, or the actions and fortunes of nations and races of men, is the history of them, recorded either in writing or by monuments, at the time, or while the remembrance of them was still fresh. If we had such records in all cases, bearing sufficient marks of their authenticity and faithfulness, we should not need to have recourse to any other kind of evidence, the inferences from which must always be comparatively conjectural, uncertain, and vague. A contemporary history of any past event is the nearest thing that can be obtained to the actual observation of it; and even for those living in the age in which the event takes place, with the exception only of the few persons who may have been present on the occasion, such a history or narrative constitutes the very best information which it is possible for them to command.

In the state of the world at which we are now arrived, with the mighty printing-press in perpetual operation everywhere like another power of nature, it is not to be apprehended that any important movement in human affairs can happen, at least in the civilized parts of the earth, without an account of it being immediately drawn up, and so multiplied and dispersed that it cannot fail to go down to posterity. Without any regular machinery established and kept at work for that purpose, the transmission of a knowledge of everything worth noting that takes place to all future generations, is now secured much more effectually than it ever was in those times when public functionaries used to be employed, in many countries, to chronicle occurrences as they arose, expressly for the information of after-ages. Such were the pontifical annalists of ancient Rome, and the keepers of the monastic registers in the middle ages among ourselves, and in the other countries of Christendom. How meagre and valueless are the best of the records that have come down to us thus compiled by authority, compared with our newspapers, which do not even contemplate as at all coming within their design the preservation and handing down to other times of the intelligence collected in them, but limit themselves to the single object of its mere promulgation and immediate diffusion! So much more effectually do we sometimes attain a particular end by leaving it to be provided for by what we may call the natural action of the social economy, than by any artificial apparatus specially contrived to secure it in what may appear to us a more direct and shorter way. In the present case, the preservation of the memory of events, which in itself is an end that never could be expected strongly to engage the zeal of men in its accomplishment, and therefore could not, generally speaking, be well attained by being directly aimed at, is secured, in the most complete and perfect form, through the intervention, and, as the incidental consequence, of another endeavour, which is found to command, in abundant measure, the most active and eager exertions. The best history for posterity is obtained out of materials which were originally provided without any view to that object at all. Nor is this true only of the written materials of history. The same is the case with nearly all the monuments and memorials of every kind of which history makes use. All have been produced, in the first instance, chiefly or exclusively for some other purpose than that of conveying a knowledge of events to posterity. Coins, at once the most distinct and the most enduring witnesses of public transactions, may be said to be wholly intended for the mere present accommodation of the community. So in general are works of architecture, which nevertheless often also eventually come to take their place among the most valuable of our historic evidences. Even a medal struck, or a statue or other monument raised, professedly in honour of some particular event, while it may be admitted to have also in view the perpetuation of the memory of the event, and the transmission of a knowledge of it to future ages, has usually for its main end the present ornament and illustration of the city or country in which it makes its appearance, and the gratification of those who are to be its first beholders. Indeed, were motives of this selfish description wanting, we should probably make very little provision for posterity in anything; and yet, instigated as we actually are, how constantly and untiringly are we making such provision in all things! Every year that an advancing country continues to be inhabited, it is becoming a richer inheritance, in every respect, for all its future occupants. The ages, however, which witnessed the dispersion and earliest migrations of the different races of the great human family, have left us, for the most part, neither history nor monuments. The only contemporary accounts that we have of the affairs of ancient Europe are those that have been preserved by the Greek and Roman writers; and the portion of history which has thus been illustrated with any degree of fulness is extremely limited. Of those countries which the writers in question were accustomed to call barbarous, being all the countries of the earth, with the exception of the two inconsiderable peninsulas of Italy and Greece, they have, for the most part, given us nothing beyond the most scanty and unsatisfactory notices. They scarcely, indeed, advert at all to any of the other European nations but themselves, till the late period of the absorption of those races in the universal empire of Rome; and then we have merely, less or more fully detailed, the history of the generally very short process by which their subjugation was accomplished. Of the remoter antiquities of these races, the classic authorities tell us scarcely anything that is much to be depended upon; and, indeed, even of their own origin the Greeks and Romans have recorded little else than fables. Still, such scattered notices as their writings contain, respecting the various nations with which they came in contact, are not to be neglected in considering the subject with which we are now engaged. The information with which they furnish us is no doubt frequently erroneous, and is always to be received with suspicion till found to be corroborated by other evidence, and by the probabilities of the case; but it may sometimes afford a clue to guide us in the investigation when other resources fail. Although a great deal of industry, learning, and ingenuity, has been expended in examining the testimonies of the Greek and Roman writers, respecting the ancient population of the British islands, perhaps all the passages that might be quoted in reference to the matter, from the entire series of these writers, have scarcely yet been brought so completely as they might be into one view, and considered both in their connexion among themselves, and as illustrating, or illustrated by, the evidence derived from other sources.

2. Next in directness among the evidences upon this subject to contemporary history (which is the

only history that is not inferential and conjectural), is to be placed the testimony of tradition. Tradition is merely unrecorded history; but the circumstance of its being unrecorded—that is to say, of its being transmitted from one generation to another by no more secure vehicle than that of oral communication—very materially detracts, of course, from its trustworthiness and value. In the case even of a document or written history, it is not always easy to ascertain that it really is what it professes to be, that it is of the age assigned to it, and that it has not been corrupted or falsified; in the case of a tradition, this matter is always of much more difficult determination. Indeed, it may be affirmed that a tradition is almost universally nothing more than an emblematic or enigmatical representation of the facts on which it is founded; and frequently the riddle is so absurd or so obscure, that no ingenuity is capable of giving a satisfactory interpretation of it. A tradition is obviously much more exposed, in its descent through a long course of time, to all the chances of alteration and perversion, than a written history; and the metamorphosis which it undergoes is sometimes so complete, as to leave little or no intelligible trace of its original form or import. On these accounts, the dependence that can be placed on this source of information respecting events of remote antiquity, must necessarily be, in most cases, very slight and dubious. Still the evidence of tradition is not altogether without its value in such inquiries as the present. When the tradition is tolerably distinct in its affirmations—when it appears to have prevailed for a long period, and to have been uniform in its tenor for all the time through which its existence can be traced—when it is found as the national belief, not of one merely, but of several countries or races—and when it harmonizes with other traditions relating to the same subject preserved in other parts of the earth, it is evidently entitled to examination at least, if not to implicit acquiescence. Of the traditions, however, which all nations have of their origin or remote ancestors, very few present all these characteristics. Most of them probably contain some truth, but it is usually overlaid and confused by a large mixture of fable, so that it becomes a process of the greatest nicety and difficulty to extract the metal from the ore.

3. The religion, the laws, the manners, and the customs of a people, with the memorials of what these have been in past ages, constitute a species of evidence as to their origin, which, although it may be described as only indirect and circumstantial, is really much more valuable than the positive testimony of mere tradition. A tradition may be a pure invention or fiction; it may be nothing more than the creation of national vanity; even where it has been honest from the first, it may be but an honest mistake; and it is always liable in its transmission through a succession of ages, to undergo change and vitiation from many causes. But a current of evidence furnished by all the most characteristic peculiarities of the national habits and feelings, cannot lie. It may be misunderstood; too much or too little may be inferred from it; we may be deceived while considering it by our own credulity, prejudices, or fancies; but we are at any rate sure that the facts before us are really what they seem to be. They are the undoubted characteristics which distinguish the people; and the only question is, how did they originate, or whence were they derived? It is true that this is commonly far from being an easy question to solve, and that we are very apt to be misled in our interpretation of such indications of the connexion between one people and another, as facts of the kind we are now adverting to may seem to supply. So many things in the notions, practices, and institutions, and in the general moral and social condition of a people, may arise from principles of universal operation—may be the growth of what we may call the common soil of human nature—that a relationship between nations must not be too hastily presumed from resemblances which they may present in these respects. Besides, institutions and customs may be borrowed by one nation from another with which it has no connexion of lineage, or may be communicated by the one to the other in a variety of ways. If France or Spain, for instance, were to adopt the present political constitution of Great Britain, the establishment of that constitution in either of these countries would form no proof, some centuries hence, that the country in question had been peopled from England. The progress both of civilization and of religion has been, for the most part, quite independent of the genealogical connexion of nations; they have been carried from one country to another, not in general along the same line by which population has advanced, but rather by intercourse, either casually arising between two countries, or opened expressly for the purpose of making such a communication. They have been propagated at one time by friendly missionaries, at another by conquering armies. But still, when, in the absence of any other known or probable cause sufficient to produce the phenomenon, we find a pervading similarity between two nations in all their grand social characteristics, we have strong reasons for inferring that they belong to the same stock. When such is the case, however, it will rarely happen that there are not also present other evidences of the relationship, of a different kind; the memory of it will probably be preserved, at least, in the popular traditions of the two countries; and the identity or resemblance of laws, religion, and customs, therefore, has usually to be considered merely as corroborative proof.

4. Some assistance may also be derived in such inquiries from an attention to the physical characteristics of nations. Where these happen to be very strongly marked, as in the case of the leading distinctions of the three great races of the Whites, the Malays, and the Negroes, they furnish very decisive evidence; but in regard to the mere subordinate varieties of the same race—and the con-

troversy is commonly confined to that ground—the tests which they afford us are of much less value. There are probably no distinctions, for instance, between the Celtic and the Germanic races which would not, in course of time, be obliterated by the mere influence of climate. It is with the several Celtic and Germanic races alone that we have to do in discussing the question of the population of the British islands. It may be doubted if any of these could have long preserved a distinct physical appearance, when mixed together, as they would be, if the country is to be supposed to have been indebted for its population to more than one of them. They might, however, remain distinguishable from each other in that respect for some time; and when Tacitus, for example, alleges the superior size and the red hair of the Caledonians of his time as a proof of their Scandinavian origin, and the dark complexions of the Silures, who inhabited the south of Wales, as making it probable that they were of Spanish descent, he may have been justified in so reasoning in that age, when the supposed immigrations, if they took place, would be comparatively recent, and the different tribes or nations that occupied the country remained still in general separate and unmixed. At the best, however, such indications can hardly be taken as anything more than a sort of makeweight—as something that may

> "—help to thicken other proofs
> That do demonstrate thinly."

5. Of course, in attempting to trace the migrations of nations, the relative geographical positions of the countries from one to another of which they are supposed to have proceeded, must not be overlooked. It is indispensable that the route assumed to have been taken shall be shown to be a natural and a probable one. The mere distance, however, of one country from another, is not the only consideration to be here attended to. Of two inhabited countries equally near to another part of the world as yet destitute of population, or not fully peopled, the inhabitants of that which is the most overcrowded, or those who are the farthest advanced in civilization, or the most distinguished for their adventurous spirit and their habits of extended intercourse, will be likely to be the first to reach and seize upon the unoccupied territory. It has been a disputed question whether the first migrations of mankind were made by land or by sea; but it does not appear that anything can be generally affirmed on the subject. Some tribes, however, seem to have been always more addicted to navigation than others; and therefore they may be supposed to have, in very early times, accomplished voyages of a length which could not be probably presumed in the case of others. In so far as respects the British islands, however, whether we suppose them to have derived their population from Gaul, from Scandinavia, or from Spain, there are no difficulties presented by the breadth of sea which would have to be traversed on any hypothesis.

6. Were the several descriptions of circumstantial evidence already enumerated our only guides when deserted by the direct testimony of history, it would scarcely be possible to arrive at much certainty on any of the controverted questions relating to the pedigree of nations. But there is another species of evidence which is in many cases, in respect both of its distinctness and of the reliance that may be placed on it, worth much more than all those that have yet been mentioned put together. This is the evidence of Language. Their peculiar language indeed is, strictly speaking, only one of the customs of a people; but it stands distinguished from other customs in two particulars, which give it an important advantage for our present purpose. In the first place, although it may be admitted that there are certain general principles which enter into the structure of all languages, and also, possibly, that all existing languages are sprung from one original, the different degrees of alliance that subsist between different tongues are yet, in most cases, very distinctly marked; nor is it possible in the nature of things that there should be a pervading similarity between two tongues that have been formed quite apart from each other. There is not here any such common soil of the human mind as would of itself produce an identity of results in different countries, like what might very well happen, to a great extent, in the case of what are commonly called manners and customs, and even in that of laws and institutions. These last naturally admit of comparatively little variety of form. It would seem nothing at all wonderful, for example, that two nations which should never have had any connexion of blood or much intercourse with each other, should yet, at the same stage of their social progress, exhibit a considerable general resemblance in their political institutions and their systems of laws—a certain degree of civilization naturally resolving itself into nearly the same forms and arrangements, in these respects, by its own spontaneous action. The same is the case with many of the ordinary arts and customs of life. These are suggested by their obvious utility, and can hardly arise except in one and the same form everywhere; or, if we suppose them to have been derived by every people from some common source, their inherent simplicity would in like manner preserve them from variation in their transmission through ever so long a period of time; and in this view also, therefore, they would fail to furnish any indication of the degree of affinity between the races to which the possession of them was found to be common. But the sounds of articulate language admit of infinite variety, and there is, generally speaking, no natural connexion between the objects of thought and their vocal signs; so that for two nations that never had any communication with each other, to be found speaking the same language, or even two languages, the vocabularies of which, in any considerable degree, resembled each other, would be a phenomenon altogether miraculous and unaccountable. Nor could the preservation, down to the present day, of a strong resem-

blance between the languages of two particular countries, be in any degree explained simply by the supposition of all existing languages having sprung from a common original; the insufficiency of such a merely primitive connexion to produce the resemblance supposed, is demonstrated by the great diversity of languages which actually subsists. We are entitled, therefore, to assume, that in all cases where we find this clear and decided relationship of languages, there must have been a comparatively recent connexion of blood, or long and intimate intercourse of one kind or another, between the races of people by whom they are spoken. For, secondly, it is another peculiarity of a national speech, that it is never adopted from another people on merely that slight acquaintance and communication which has sometimes sufficed not only to transfer a knowledge of the ordinary arts of civilized life, but to introduce into and establish in a country, whole systems of religion, of laws, and of philosophy. These things, as already observed, have frequently been conveyed from one part of the earth to another by a few missionaries, or chance emigrants, or simply by the opportunities of commerce and travel. But languages have never been taught in this way. A people always derives its language either from its ancestors, or from some other people with which it has been for a long time thoroughly mixed up in the relations of social and domestic life. It would, we apprehend, be impossible to quote an instance of an exchange of the popular speech of any country being produced by anything short of either the amalgamation, or at least the close compression, of one people with another, which is the result only of conquest. This can hardly take place without the history or memory of the event being preserved, and therefore there is little or no danger of a language thus imposed being ever mistaken for one derived in the ordinary way, or of any difficulty being thereby occasioned in the application of the general rule—that where the languages exhibit a strong resemblance to each other, the nations speaking them are of one stock. A person, for instance, visiting South Britain in the third or fourth century, would have found many of the people speaking Latin, and the people of France, or ancient Gaul, still speak a dialect of the Latin, for the modern French tongue is little else; but no considerate inquirer into such matters would ever conclude from these facts, in disregard of all other evidence, that the original population of Britain and of Gaul was Roman. The prevalence of the Roman speech is sufficiently accounted for, in these cases, by the Roman conquest and colonization of both countries, which are events that have left, and could not fail to leave, abundant memorials of themselves behind them, in a great variety of forms.

7. But there is still to be noticed another source of evidence sometimes available on the subject of the original population of a country, which is of kindred character to that derived from the language spoken in it, and of equal distinctness and trustworthiness. This is the evidence supplied by the topographical nomenclature of the country, or the language to which the most ancient names of places in it are found to belong. Names have all some meaning when first imposed; and when a place is named, for the first time, by any people, they apply to it some term, in early times generally descriptive of its natural peculiarities, or something else on account of which it is remarkable, from their own language. When we find, therefore, that the old names of natural objects and localities in a country belong, for the most part, to a particular language, we may conclude with certainty that a people speaking that language formerly occupied the country. Of this the names they have so impressed are as sure a proof as if they had left a distinct record of their existence in words engraven on the rocks. Such old names of places often long outlive both the people that bestowed them, and nearly all the material monuments of their occupancy. The language, as a vehicle of oral communication, may gradually be forgotten, and be heard no more where it was once in universal use, and the old topographical nomenclature may still remain unchanged. Were the Irish tongue, for instance, utterly to pass away and perish in Ireland, as the speech of any portion of the people, the names of rivers and mountains, and towns and villages, all over the country, would continue to attest that it had once been occupied by a race of Celtic descent. On the other hand, however, we are not entitled to conclude, from the absence of any traces of their language in the names of places, that a race, which there is reason for believing from other evidence to have anciently possessed the country, could not really have been in the occupation of it. A new people coming to a country, and subjugating or dispossessing the old inhabitants, sometimes change the names of places as well as all or many other things. Thus when the Saxons came over to this island, and wrested the principal part of it from its previous possessors, they seem, in the complete subversion of the former order of things which they set themselves to effect, to have everywhere substituted new names in their own language, for those which the towns and villages throughout the country anciently bore. On this account the topographical nomenclature of England has ever since been, to a large extent, Saxon; but that circumstance is not to be taken as proving that the country was first peopled by the Saxons.

Guided by the principles that have been laid down, we will now proceed to explain those views respecting the original population of the British islands which seem best to accord with the various facts bearing upon the question, and to form together the most consistent whole. It will be convenient to consider the several parts of the subject in the order of the population, I. of England; II. of Ireland; III. of Scotland; IV. of Wales.

I. For a long time, what was held to be the orthodox belief respecting the original population of the

southern part of Britain, was the story of the descent of the first Britons from the Trojans, a colony of whom was supposed, after the destruction of their native city, to have been conducted to this island by Brutus, a grandson or great-grandson of Æneas, more than a thousand years before the commencement of our era. The person who first made this story generally known was the famous Geoffrey ap Arthur, Archdeacon of Monmouth, and afterwards Bishop of St. Asaph, who flourished in the twelfth century; but there is no reason to suppose, as has been sometimes asserted, that he was its inventor. His Latin history is, in all probability, what it professes to be—a translation of an Armorican original, entitled "Brut y Breninodd, or a Chronicle of the Kings of Britain," which was put into his hands by his friend Walter de Mapes, otherwise called Calenius, Archdeacon of Oxford, who had himself brought the manuscript from Bretagne. The same legend, which is found in so amplified a form in Geoffrey's work, is more briefly detailed in various histories of a much earlier date. The earliest writer to whom it can be traced, appears to be the Welsh priest Tysilio, who is believed to have flourished in the latter part of the seventh century. The Brut (that is, the Chronicle) of Tysilio seems to have been the prototype both of the work which Geoffrey translated, and of many other similar performances.*

The vanity of being supposed to be sprung from the Trojans was common, in early times, to many of the European nations; but the English probably retained their belief in the notion to a later date than any of the rest. It is gravely alleged by Edward I., in a letter which he addressed to Pope Boniface in 1301, as part of the argument by which he attempts to establish the supremacy of the English crown over Scotland. As the Romans themselves pretended to a Trojan descent, it has been plausibly conjectured that the various nations brought under subjection by that people were induced to set up the same claim, through an ambition of emulating their conquerors; and at a later period it obviously fell in with the views or natural prejudices of the churchmen, who were for the most part the compilers of our histories, to encourage an opinion which drew the regards of the people towards the ecclesiastical metropolis, as the head city of their race as well as of their religion. The acute and judicious Camden, at the end of the sixteenth century, was almost the first inquirer into our national antiquities who ventured to question the long-credited tale; yet nearly a hundred years afterwards we find a belief in its truth still lingering in the poetic imagination of Milton.

Geoffrey makes Brutus and his Trojans to have found Britain nearly uninhabited, its only occupants being a few giants of the race of Cham, over whom the famous Gogmagog ruled as king; but another form of the fable settles a numerous population in the country at a much earlier date. "As we shall not doubt of Brutus's coming hither," says Holinshed, "so may we assuredly think that he found the isle peopled, either with the generation of those which Albion the giant had placed here, or some other kind of people whom he did subdue, and so reigned as well over them as over those which he brought with him." Albion is said to have been a son of Neptune, who took the island from the Celts, after they had occupied it for above three hundred years, under a succession of five kings, the first of whom was Samothes, the eldest son of Japhet, and the same who is called by Moses Meshech. From Samothes, Britain received the first name it ever had, Samothea. Albion, and his brother Bergion, who was King of Ireland, were eventually conquered and put to death by Hercules. The inventor of this history appears to have been Annius or Nanni, a Dominican friar of Viterbo in Italy, who published it about the end of the fifteenth century, in a forged work which he attributed to Berosus, a priest of the Temple of Belus, at Babylon, in the time of Ptolemy Philadelphus. It was afterwards taken up and further illustrated by the celebrated English Bishop Bale.

Another ancient account respecting the original population of Britain, is that preserved in the Welsh poetical histories known by the name of the Triads, in allusion to the three events which each of them commemorates. "Three names," says the first Triad, "have been given to the isle of Britain since the beginning. Before it was inhabited, it was called Clas Merddin (literally, the country with sea-cliffs), and afterwards, Fel Ynis (the Island of Honey). When government had been imposed upon it by Prydain, the son of Aedd the Great, it was called Inys Prydain (the Island of Prydain); and there was no tribute to any but to the race of the Cymry, because they first obtained it; and before them there were no more men alive in it, nor anything else but bears, wolves, beavers, and the oxen with the high prominence." * The Cymry, or ancestors of the present Welsh, therefore were, according to this authority, the first inhabitants of Britain. Another triad (the fourth of the same series) states that their leader was Hu Cadarn, that is, Hugh the strong, or the mighty, by whom they were conducted through the Hazy, that is, the German Ocean, to Britain, and to Llydaw, that is Armorica, or Bretagne. It is added, that they came originally from the country of Summer, which is called Defrobani, where Constantinople

* The best edition of Geoffrey of Monmouth is printed under the title of Galfridus Monumetensis de Origine et Gestis Regum Britannicorum, in Jerome Commeline's Britannicarum Rerum Scriptores Vetustiores et Præcipui, fol. Heidelb. 1587. It has been translated into English by Aaron Thompson, 8vo. Lond. 1718. An analysis of the work is given by Mr. Geo. Ellis, in his Specimens of Early English Metrical Romances, vol. i. sec. 3. The Brut of Tysilio is printed in the second volume of the Welsh Archaiology, 3 vols. 8vo. 1801; and there is an English translation of it by the Rev. Peter Roberts, 8vo. Lond. 1810. On the dispute relating to Geoffrey of Monmouth, see Warton's Dissertation on the Origin of Romantic Fiction in Europe, prefixed to his History of English Poetry, 8vo. edit. Lond. 1824, vol. i. pp. viii.-xiv., and the Preface of the editor (the late Mr. Price), pp. 97-99; Turner's History of the Anglo-Saxons, 4th edit. 8vo. Lond. 1823, vol. i. p. 62; and Britannia after the Romans, 4to. Lond. 1836, pp. xxii.-xxxii.

* Turner's Anglo-Saxons, i. 33. The series which this triad introduces, and which is stated to be one of the most complete that exist, has been printed in the original Welsh, in the second volume of the Welsh Archaiology.

is. Some interpreters have been inclined to go so far for Defrobani as to the island of Ceylon, one of the ancient names of which was Tabrobane;* and we shall find in the sequel that there is another theory, as well as that of the Welsh triads, which connects the British islands with Ceylon. Subsequent triads inform us, that the next people who came to Britain were the Lloegrwys, who came from the land of Gwasgwyn, or Gascony, and were of the same race with the Cymry; as were also the next colonists, the Brython, from the land of Llydaw (Bretagne). These, it is added, were called the three peaceful nations, because they came one to another with peace and tranquillity; they also all spoke the same language. From the Lloegrwys, a great part of England received the name of Lloegria. Afterwards, other nations came to the country with more or less violence; according to the enumeration of Mr. Turner, "the Romans; the Gwyddyl Ffichi (the Picts), to Alban or Scotland, on the part which lies nearest to the Baltic; the Celyddon (Caledonians), to the north parts of the island; the Gwyddyl, to other parts of Scotland; the Corraniaid from Pwyll (perhaps Poland), to the Humber; the men of Galedin, or Flanders, to Wyth; the Saxons; and the Llychlynians, or Northmen."† The triads, from facts mentioned in them, appear not to be older than the reign of Edward I.,‡ although they may have been founded upon the fragments of earlier compositions; but even if they were of much greater antiquity, they could be no authority for anything more than the traditionary accounts of the first peopling of the country.

Of the theories which have been proposed upon this subject by modern inquirers, one supposes the first colonizers, both of Britain and Ireland, to have been the Phœnicians. The original suggester of this notion appears to have been Aylett Sammes, a writer of the latter part of the seventeenth century. § It has been recently advocated, with considerable ingenuity, by Sir William Betham, who, however, is of opinion that the Phœnicians were preceded in the occupation of both islands by the Caledonians, afterwards called the Picts, whom he conceives to have been a people of Scandinavian origin, the Cimbri of antiquity. The Phœnicians he considers to be the same people with the Gael, or Celts.‖

Notwithstanding any diversity of views, however, which may exist as to some of the remoter points of the investigation, it may be affirmed to be now admitted on all hands that the numerous population which the Romans found in the occupation of the southern part of this island, about half a century before the commencement of our era, was principally a Celtic race, and had, in all probability, been immediately derived from the neighbouring country of France, then known by the name of Gallia. Cæsar, the first of the ancients who saw the people, or who has described them, informs us that their buildings were almost similar to those of the Gauls, and that their religion was the same; and it appears also from his narrative, that a close political alliance existed between the states of Britain and those of Gaul, and that the latter were all along aided by the former in their resistance to the Romans. The proximity of the one country to the other, indeed—the British coast being visible from that of Gaul—would almost alone authorize us to conclude that the one could not long remain unoccupied, after the other had been settled. Tacitus, who had the best opportunities of information, has expressly recorded that, in addition to an identity of religious rites, the languages of the Gauls and Britons were nearly the same; and evidence of this fact remains to the present day, in the Celtic character of the topographical nomenclature of the south, as well as of the other parts of Britain, in so far as it has not been obliterated by the Saxon conquest. Bishop Percy has observed that in England, "although the names of the towns and villages are almost universally of Anglo-Saxon derivation, yet the hills, forests, rivers, &c., have generally retained their old Celtic names."*

It is certainly possible that the country may, previously to the arrival of the Gauls, have been occupied by a people of different origin, who on that event were obliged to retire to the northern parts of the island, where they became the progenitors of the Caledonians; but it would be difficult to bring forward any satisfactory proof that such was the case. This supposed previous race has not left behind it either any traces of its language, or any other monuments of its existence. Nothing remains, either on the face of the soil, or in the customs of the people, which would suggest the notion of any earlier colonization than that from Gaul. Everything of greatest antiquity that survives among us is Celtic.

At the same time this view of the subject is not free from some difficulties, which it is fair to state. Cæsar, in the first place, in his account, makes a marked distinction between the inhabitants of the coast of Britain and those of the interior, not only describing the latter as much more rude in their manners, and altogether less advanced in civilization than the former, but also expressly declaring them to be, according to the common belief at least, of a different race. He says that the tradition was, that they originated in the island itself; whereas the inhabitants of the maritime parts had come over from Belgium, and seized by violence upon the portion of the country which they occupied. This statement may be considered, at least, to establish the fact, that the occupation of the coast

* Preface to translation of Mallet's Northern Antiquities, i. xxxix.

by the Belgic invaders was a much more recent event than the colonization from which the people of the interior had sprung. The phraseology of the account throughout is very precise in regard to the distinction intimated to exist between the two races. For instance, it is said in one place that those inhabiting Kent were by far the most civilized portion of the British population, and that in their customs or general manner of life, they differed but little from the Gauls, while most of those in the interior sowed no corn, lived only upon milk and flesh, and were clothed in skins; and then the writer immediately proceeds to mention some other peculiarities as common to all the Britons.* It is true he does not affirm that different languages were spoken on the coast and in the interior; but it so happens, that on the subject of language he says nothing whatever in his account of Britain. He informs us, however, that Kent and the maritime portion of the country generally was inhabited by Belgians; and he had already stated in other parts of his work, first, that the Belgæ differed from the Gauls or Celts both in language, in institutions, and in laws,† and secondly, that they were a people for the most part of German descent, who had acquired a settlement for themselves on the left bank of the Rhine by expelling the Gauls, by whom the district was previously occupied.‡ In so far, therefore, as the testimony of Cæsar is worth anything, it would seem to imply that the Britons whom he describes were a German or Teutonic race, not a Celtic. It is to be observed, that the inhabitants of the maritime parts were the only portion of the people of Britain whom he had any opportunity of seeing. But if this be the case, what is the value of his assimilation of the Britons to the Gauls, as proving the Celtic lineage of the former?

Notwithstanding what Cæsar has said in the passages we have just quoted, it has been a much controverted question to which of the two great races from whom the population of the principal part of Europe appears to be derived—the Celts or the Germans—the ancient Belgæ are to be considered as belonging. It has been argued, that when Cæsar describes them as differing in language from the Celts, he must in all probability be understood as meaning only that they spoke a different dialect of the same language; and that that expression, therefore, is not to be taken as any evidence that they were not a Celtic people.§ It must be admitted that the point is an exceedingly doubtful one. The distinction, in respect both of language and of lineage, between the Celtic and the Teutonic, Germanic, or Gothic races, may be said to be the fundamental canon of the modern philosophy of the origin and connexion of nations; but it is not yet very long since its importance came to be understood. The old writers on the subject of the Celts, all include both the Celtic and the Gothic races under that name.* Attention seems to have been first called to the distinction in question by our countryman John Toland,† and it was afterwards much more fully unfolded by Bishop Percy.‡ The most elaborate discussion, however, the subject has met with, is that which it received from the late John Pinkerton,§ in all whose historical investigations the radical distinction between the Celtic and the Gothic races, and the inherent inferiority of the former, are maintained with as much zeal and vehemence, as if the writer had a personal interest in the establishment of the point. The correctness of the new views, in so far as respects the general position of the non-identity of the Celtic and Germanic nations, and also their importance to the elucidation of the whole subject of the original population of Europe, are now universally admitted; but perhaps in avoiding the error of their predecessors, there has been a tendency on the part of modern writers to run into the opposite extreme, and to assume a more complete disconnexion between everything Celtic and everything Gothic, than can be reasonably supposed to have existed. It is to be recollected that both the Celts and the Goths appear to have come to the west of Europe, though at different times and by different routes, from the same quarter; both races are undoubtedly of eastern origin, and are admitted by all physiologists to have been branches of the same great paternal stem. Both are classed as belonging to the same Caucasic or Japetic family. This being the case, the distinction between them, when they eventually found themselves planted alongside of each other in the different countries of Europe, could hardly have been so complete in all respects as it is usually considered. Their languages, for instance, notwithstanding the striking dissimilarity both in vocabulary, in structure, and in genius, which they seem now to exhibit, may not have been by any means so unlike each other two thousand years ago, seeing that, according to all historic probability, they must have both sprung from the same common ancestral tongue. Referring to Schilter's 'Thesaurus Antiquitatum Teutonicarum,' and Wachter's 'Glossarium Germanicum,' "these vastly learned authors," observes a late writer, "demonstrate, without intending it, that the Celtic and Teutonic languages had a

§ Dissertation on the Origin and Progress of the Scythians or Goths, 8vo. 1787, and appended to the second volume of his Enquiry into the History of Scotland preceding the Reign of Malcolm III., 1789.

common origin."* Both the Celtic and the Teutonic have been shown to enter largely into the composition of the Greek and Latin; and it has been lately conclusively proved by Dr. Pritchard, by a minute comparison of vocabularies and grammatical peculiarities, that the Celtic belongs to the same great family of Indo-European languages with the Sanskrit, the Greek, the Latin, and the German.†

Upon the whole, therefore, the probability seems to be, that although the inhabitants of the inland part of South Britain, at the time of the Roman invasion, were the posterity of a much earlier colonization than that which had peopled the maritime parts of the island, yet both the tribes of the coast and those of the interior were of the same Celtic descent, and all spoke dialects of the same Celtic tongue. We find the evidences of this community of language and of lineage spread over the whole length of the country, from its northern boundary to the Channel; for the oldest names of natural objects and localities, even in the portion of this range which is commonly understood to have been eventually occupied by Belgic colonies, are equally Celtic with those that occur elsewhere. This circumstance must be considered as a testimony, in regard to the original population of the country, far outweighing the meagre and vague notices handed down to us upon the subject by Cæsar and Tacitus; and it is to be explained only by supposing either that the seats of the Belgic tribes in Britain had, before their arrival, been in the possession of a Celtic race, or that the Belgians, notwithstanding their German descent, had, before their invasion of Britain, become, by their long residence on the west side of the Rhine, more a Celtic than a Teutonic people. If there was any difference of language between them and the other inhabitants of South Britain, it could scarcely have amounted to more than a difference of dialect. There is certainly, at least, no indication in the topographical nomenclature of the country, that any Teutonic people, before the arrival of the Saxons in the fifth and sixth centuries of our era, had ever occupied those parts of it of which they then came into possession. It is not unlikely that a few settlements may have been effected, in very early times, on the west coast by the Spaniards, and on the east coast by emigrants from the opposite Scandinavian regions; but, with these exceptions, there appears to be little reason to doubt that the whole of what is now called England was first occupied by a Celtic population, which came over in successive swarms from the neighbouring country of Gaul. Some speculators have even attempted to show that Britain was originally united by land to Gaul.‡ At any rate, it may be assumed that the first migration from the one to the other took place at a very early period, most probably considerably more than a thousand years before the commencement of our era. The Belgic colonization of the southern coast seems to have been an event of historic memory—that is to say, not yet transformed into the shape of fable—in Cæsar's day; and, therefore, we may suppose it to have happened within two or three centuries preceding that date.

The name Britannia, by which our island was known among the Greeks and Romans, was doubtless formed from the name in use among the natives themselves. With respect to its origin and meaning many conjectures have been proposed, a long list of which may be seen in Camden. Geoffrey of Monmouth, of course, and the other retailers of the story of Brutus and his Trojans, derive it from the name of that leader. We have seen from one of the Welsh triads quoted above, that it is deduced by those authorities from an early king of the country—the first, it is affirmed, by whom a regular government was established in it—Prydain, the son of Aedd the Great. These fables are deserving of no attention; and equally worthless and palpably absurd are most of the other etymologies which have been suggested by the laborious ingenuity of learned word-torturers. Among the more plausible interpretations may be mentioned that of Whitaker, who contends that Britin, which he conceives to be the origin of the Greek and Roman Britannia, was not the name of the island but of its inhabitants, and that it is a plural word, of which the singular is Brit, signifying divided or separated. The Britin, therefore, he translates the separated people, or the emigrants; and he supposes that name to have been given them by their kindred in Gaul, whom they left in order to occupy the island. This account of the matter, however, we believe, has not gained much acceptance among Celtic scholars. Yet it is not very distant from the notion of Sir William Betham, who conceives the term Britannia to have been formed from the Celtic *Brit daoine*, that is, painted people—the name, he says, which "the Phœnician Gallic colony," on their arrival, bestowed upon the wild natives of Scandinavian extraction whom they found in possession of the country. Whitaker adverts to the application of the word *Brit* in the sense of painted; it is the same word, he observes, with *Brik* or *Brechan*, the name still given to his tartan plaid by the Scotch Highlander, and signifying properly a garment marked with divided or variegated colours. The anonymous author, also, of the lately published volume entitled "Britannia after the Romans," (the work of a scholar and a man of talent, who is apt, however, to have more charity for his own crotchets than might be expected from his contempt for those of other people,) strenuously maintains the derivation of the name Briton from a Welsh, and, as he conceives, old British, word sig-

† The Eastern Origin of the Celtic Nations, 8vo. 1831.

‡ See this position learnedly maintained in a dissertation, De Britannia quondam pene Insula, prefixed to Musgrave's Antiquitates Britanno-Belgicæ, 3 vols. 8vo. 1719. It will appear presently that Mr. Whitaker, in his Genuine Origin of the Britons Asserted (1773), has, without any view to the establishment of this point, suggested that the term *Britin* means, properly, the separated people, or the emigrants, as he explains it. This epithet would be better accounted for upon the supposition of the actual separation of the two countries by the intervention of the sea.

nifying *painted*. Pezron, he observes, although his authority is of no weight, has, nevertheless, the merit of surmising this true etymology.

There can be little doubt that the element *tan* in Britannia is the same word which we find forming a part of so many other names of countries, both ancient and modern, such as Mauri-tan-ia, Aqui-tan-ia, Lusi-tan-ia, Kur-dis-tan, Afghanis-tan, Kuzis-tan, Louris-tan, Hindos-tan, &c. It appears to signify merely a land or country, though it is not, we believe, found in that sense in any existing dialect of the Celtic, and for anything that is known, it may after all be really *Daoine*, people, as suggested by Sir William Betham. *Bruit*, again, is the Celtic term for tin, or metal generally; so that Bruit-tan, or, as smoothed down by the Greeks and Romans, Britannia, signifies altogether the metal or tin land—an epithet which would be naturally bestowed upon the country, from the circumstance for which it probably first became known to other nations. The meaning of the name is exactly the same with that of the Greek Cassiterides, by which alone the British islands were known to Herodotus.

II. If the traces of an original Celtic population are still to be found over the greater portion of the south of Britain, such traces are much more abundant, and more distinctly legible, over the whole of Ireland. The ancient topographical nomenclature of that country is exclusively Celtic, as the speech of a large proportion of the people still continues to be. A Celtic race, therefore, must either have formed the original population of the country, or must have become its predominant population in very ancient times. Whence was this race derived?

The traditional history preserved among the Irish people makes the island to have been possessed by three nations in succession—the Firbolgs, the Tuath de Danans, and the Milesians, or Scots—the last-mentioned of whom it represents as the progenitors of the present Celtic population. The question of who these races were has given occasion to endless controversy. What is certain is, that both the Firbolgs and the Tuath de Danans existed in the country within what may be properly called the historic period. The Firbolgs are generally believed to have been a Belgic colony or invading band; and the Tuath de Danans a Scandinavian people. Another theory, however, makes the latter, and not the Milesians, to be the Celtic people, from whom have descended the great bulk of the present population of the island.

There come to us through the long night of the past many strange glimmerings of an extraordinary civilization existing in Ireland in a very remote antiquity, and of a wide-spread renown which the island had once enjoyed as a peculiarly-favoured seat of letters, the arts, and religion. That during a considerable portion of the period which we are accustomed to call the dark ages, the light of learning and philosophy continued to shine in Ireland after it had been extinguished throughout all the rest of Christendom, although so remarkable a circumstance has been little noticed by most of the historians of modern Europe, must be regarded as a fact as well established as any other belonging to that period. From about the beginning of the seventh till towards the close of the eighth century, Ireland, under the name of Scotia, was undoubtedly the recognized centre and head of European scholarship and civilization. This is abundantly proved by the testimony of contemporary writers in other countries, as well as by the remaining works of the early theologians and philosophers of Christian Ireland themselves. But long before this Christian civilization, there would seem to have been another period, when the arts existed in that country in a high state of advancement, in the midst of surrounding barbarism. If there were no other evidences of this than those extraordinary erections, the Round Towers, which are still found standing in so many places, the inference would not be easily resisted. The argument derived from these buildings is very short and direct. We have evidence which cannot be questioned, not only of their existence in the twelfth century, but of their great antiquity even at that date. Giraldus Cambrensis, who then visited Ireland, describes them in such terms as show that the memory of their origin had been already long lost among the people. If, as has been supposed by some writers, they had been erected by the Danes, who occupied a part of the island two or three centuries before, this could not have been the case. But the notion that the Danes were the architects of the Round Towers of Ireland is altogether untenable on other grounds. No similar structures are to be found, nor any trace of such ever having existed, either in the native country of the Danes, or in any other country in which they ever obtained a settlement. Nay, in Ireland itself, it is curious enough, that while Round Towers are found in many parts of the country where the Danes never were, in other parts which these invaders are well known to have occupied, there are none. Nor can these Round Towers with any probability be looked upon as Christian monuments; there are no such buildings in any other part of Christendom, nor anywhere, indeed, throughout the western world, if we except Scotland, which, from many other evidences, appears to have been in part colonized from Ireland. We are forced therefore to ascend in search of their origin beyond the date of the establishment of Christianity in the latter country, which is well ascertained to have taken place in the early part of the fifth century. But for some centuries at least preceding that date there is certainly no reason to believe that there existed in Ireland any such superior civilization or knowledge of the arts as would account for the erection of the Round Towers. On the contrary, it appears probable, from all the facts that can be collected, and all the contemporary notices that have come down to us, that at the time of the invasion, and during the occupation of Britain by the Romans, the Irish

Round Tower of Donoughmore.*

were in much the same semi-barbarous condition with the Britons. The primitive civilization of Ireland, therefore, whether under the same, or, what is more likely, under a different dominant race, must be sought for in a yet more remote antiquity. The only structures that have been anywhere found similar to the Irish Round Towers are in certain countries of the remote east, and especially in India and Persia. This would seem to indicate a connexion between these countries and Ireland, the probability of which, it has been attempted to show, is corroborated by many other coincidences of language, of religion, and of customs, as well as by the voice of tradition, and the light, though faint and scattered, which is thrown upon the subject by the records of history. The period of the first civilization of Ireland then would, under this view, be placed in the same early age of the world which appears to have witnessed, in those oriental countries, a highly advanced condition of the arts and sciences, as well as flourishing institutions of religious and civil polity, which have also, in a similar manner, decayed and passed away. Nothing can be more certain than that the first period of human civilization is at any rate much more ancient than the oldest written histories we now possess. The civilization of Egypt was on the decline when Herodotus wrote and travelled, nearly twenty-three centuries ago. The vast architectural monuments of that country were of venerable antiquity, even when his eye beheld them. The earliest civilization of Phœnicia, of Persia, and of Hindostan, was, perhaps, of still more ancient origin. We know that the navigating nation of the Phœnicians had, long before the time of Herodotus, established flourishing colonies, not only in the north of Africa, but also on the opposite coast of Spain. Even the foundation of Marseilles, on the coast of France, by a Greek colony, has not been stated by any authority to be more recent than six hundred years before the commencement of our era, and there are some reasons for believing a town to have been established there at a much earlier date. There is, therefore, no such improbability as is apt to strike persons, not conversant with such investigations, in the supposition that Ireland also may have been colonized by a civilized people at some very remote period. It seems, in-

* In most instances the cut of a particular local object will have reference to its existing state, except when otherwise expressed.

deed, to be scarcely possible otherwise to account either for the Round Towers, or for the other relics and memorials of a formerly advanced state of the arts which the country still contains—the extensive coal-works and other mining excavations which appear in various places, and the many articles of ornamental workmanship in gold and silver which have been found in almost every part of the island, generally buried deep in the soil—all unquestionably belonging to a time not comprehended within the range of the historic period.*

It is remarkable, and may be taken as some confirmation of the evidence afforded by circumstances of another kind which appear to indicate a connexion in very ancient times between Ireland and the east, that nearly all the knowledge of the country of which we find any traces in the Greek and Roman writers seems to have been derived from oriental sources. If the Orphic poem on the voyage of the ship Argo be of the age to which it has been assigned by some of the ablest critics, namely, five hundred years before the birth of Christ, it is there that we have the first mention of Ireland by its Celtic name. The writer speaks of an island which he calls Iernis, as situated somewhere in the Atlantic; and, from various passages of his poem, he is believed to have had much of his information from the Phœnicians. He makes no mention of Britain. Herodotus, a century later, had only heard of the British islands by the descriptive epithet of the Cassiterides, or Tin Islands. Even Eratosthenes, in the third century before Christ, appears not to have been aware of the existence of Ireland, although the island is mentioned by the name of Ierne, in a work attributed to Aristotle, and which has been supposed to be at least of the age of that philosopher, who flourished in the fourth century before the commencement of our era.† Polybius, in the second century before Christ, just notices Ireland. On the other hand, Ptolemy, who is known to have composed his work from materials collected by the Tyrian writer Marinus, gives us, in his Geography, a more full and accurate account of Ireland than of Britain. Another very curious notice of Ireland is that which has been preserved in the Latin geographical poem of Festus Avienus, a writer of the fourth century, but who tells us expressly that he drew his information on the subject from the Punic records. Avienus gives us the only account which we possess of the voyage made by the Carthaginian navigator Himilco to the seas north of the Pillars of Hercules, at the same time that Hanno, whose Periplus has come down to us, set out in the opposite direction from the same straits. These voyages seem to have been undertaken about a thousand years before our era. In the narrative given by Avienus, which is a very slight sketch, the islands with which the Carthaginians were wont to trade are designated the Œstrumnides, by which name is supposed to have been meant the Scilly Islands;* and two days' sail from these is placed, what is said to have been called by the ancients, the Sacred Island, and to be inhabited by the nation of the Hiberni. The island thus described there can be no doubt is Ireland. Near, either to the Œstrumnides or the island of the Hiberni (it is not very clear which is intended), is said to extend the island of the Albiones, that is, Britain.

The existence of an abode of science and the arts, and the seat probably also of some strange and mysterious religion, placed in the midst of the waters of the farthest west, and withdrawn from all the rest of the civilized world, could hardly have failed, however obscurely and imperfectly the tale might have been rumoured, to make a powerful impression upon the fancy of the imaginative nations of antiquity. Some speculators have been disposed to trace to the Ireland of the primeval world, not only the legend of the famous island of Atlantis mentioned by Plato and other writers, but also the still earlier fables of the Isle of Calypso, and the Hesperides, and the Fortunate Islands, and the Elysian Fields of Homer and other ancient poets. "The fact," observes Mr. Moore,† "that there existed an island devoted to religious rites in these regions, has been intimated by almost all the Greek writers who have treated of them; and the position in every instance assigned to it, answers perfectly to that of Ireland. By Plutarch it is stated that an envoy despatched by the Emperor Claudius to explore the British Isles, found, on an island in the neighbourhood of Britain, an order of magi accounted holy by the people; and in another work of the same writer, some fabulous wonders are related of an island lying to the west of Britain, the inhabitants of which were a holy race; while, at the same time, a connexion between them and Carthage is indistinctly intimated." In a passage which Strabo has extracted from an ancient geographer, it is expressly stated that in an island near Britain sacrifices were offered to Ceres and Proserpine, in the same manner as at Samothrace, in the Egean, the celebrated isle where the Phœnicians had established the Cabiric or Guebre worship, that is, the adoration of the sun and of fire, which they again appear to have received from the Persians. "From the words of the geographer quoted by Strabo," continues Mr. Moore, "combined with all the other evidence adduced, it may be inferred that Ireland had become the Samothrace, as it were, of the western seas; that thither the

* See these and other arguments to the same effect, copiously illustrated, though applied to the maintenance of somewhat varying hypotheses, in the several publications of General Vallancey; Lord Rosse's Vindication of the Will of the Right Honourable Henry Flood; Dr. Villanueva's Phœnician Ireland, translated by the late Mr. H. O'Brien; Mr. O'Brien's highly ingenious and learned, though occasionally rather fanciful, work on the Round Towers (2nd edit. 8vo. Lond. 1834); Sir William Betham's Gael and Cymbri (8vo. Dublin, 1834); and the first volume of Mr. Thomas Moore's History of Ireland (12mo. Lond. 1835)—a work not more distinguished by those graces of composition which were to have been expected from its eminent author, than by extensive erudition and varied and laborious research.

† Περι Κοσμου. The writer says that in the sea beyond the Pillars of Hercules (the Straits of Gibraltar) are two large islands, called the British Islands, Albion and Ierne.

* See a curious interpretation of this name in Davies's Celtic Researches, p. 228.

† History of Ireland, i. 13.

Cabiric gods had been wafted by the early colonizers of that region; and that, as the mariner used, on his departure from the Mediterranean, to breathe a prayer in the Sacred Island of the East, so in the seas beyond the Pillars, he found another Sacred Island, where, to the same tutelary deities of the deep, his vows and thanks were offered on his safe arrival."

But the most curious of all the legends preserved by the classical writers, which have been supposed to allude to Ireland, is the account given by Diodorus Siculus of the Island of the Hyperboreans, on the authority, as he says, of several investigators of antiquity, and especially of Hecatæus, an author who is believed to have flourished in the sixth century before our era. The island, in the first place, is stated to lie in the ocean over against Gaul, and under the arctic pole — a position agreeing with that assigned to Ireland by Strabo, who describes it as situated beyond Britain, and as scarce habitable for cold. It is affirmed to be as large as Sicily, which is a sufficiently correct estimate of the size of Ireland. The soil, the narrative goes on to say, is so rich and fruitful, and the climate so temperate, that there are two crops in the year. Mention is then made of a famous temple of round form, which was here erected for the service of Apollo, whom the inhabitants worshipped above all other gods, his mother Latona having been born in the island. Here seems to be an evident reference to the Round Towers, and the Cabiric religion, of which they were in all probability the temples. The remainder of the account contains apparent allusions to the skill of the inhabitants in playing on the harp, and to their knowledge of astronomy, a study which has always been associated with the worship of the sun. Upon the supposition that this relation refers to Ireland, the famous Abaris, who is said to have come from the Hyperboreans on an embassy to Athens, six centuries before the commencement of the Christian era, and of whose learning and accomplishments so many wonderful stories are told by various authors, would be an Irishman.*

These, and other seeming indications of an oriental connexion have appeared so irresistible to many of the ablest and most laborious inquirers into the antiquities of Ireland, that, however variously they may have chosen to shape their theories in regard to subordinate details, they have found themselves obliged to assume an early colonization of the country by some people of the east, as the leading principle of their investigations. Whatever question there may be, however, as to who this people were, it is agreed on all hands that they were a people speaking the present Irish language. The popular tradition, which makes the Milesians or Scots to have been a Scythian colony, considers them nevertheless to be Gael, or Gauls. Colonel Vallancey, who in his latter days adopted the hypothesis that the original Irish people were a colony of Indo-Scythians, and denied that they were either Gauls or Celts, maintained at the same time that the Irish was not a Gallic or Celtic tongue. Mr. O'Brien, who deduces the Irish population from Persia, makes the Irish to have been the ancient language of that country.* Finally, Sir William Betham and others, whose system is that Ireland was colonized by the Phœnicians, contend that the ancient Phœnician or Punic language was the same with the modern Irish, and hold themselves to be able to make out that point from the remains of it which we yet possess. In particular, they supply, by the aid of the Irish tongue, an interpretation of the celebrated scene in Punic, in the "Pœnulus" of Plautus, which has at least a very imposing plausibility.† "The complete identity of the Phœnician and Irish languages," observes Sir William Betham, "explains, makes palpable, and elucidates, not only the history and geography of Europe, but most of the ancient maritime world, and in fact removes every difficulty to the acquirement of correct notions of the events of the earliest times."

There can be no doubt, it may be here observed, that the Irish is a Celtic tongue, and essentially the same with that which was anciently spoken by the chief part of the population both of Gaul and of the south of Britain. Colonel Vallancey and others who have doubted or denied this identity have been misled by taking it for granted that the true representative of the Celtic tongue of the ancient Britons and Gauls is the modern Welsh, which, as we shall presently have occasion to notice more particularly, appears really to be a different language altogether.

It may also be remarked that there does not appear to be any irreconcilable discordance between the two principal modern theories on the subject of the ancient connexion of Ireland with the East, namely that which attributes the colonization of the country to the Phœnicians, and that which deduces the people, together with their language and their religion, from Persia. It is far from improbable that the Phœnicians were originally a Persian people. The ancient writers generally bear testimony to the fact that the district called Phœnicia, at the extremity of the Mediterranean, was not their original seat. They seem to have found their way thither from some country farther to the east or the south-east. Herodotus makes them to have been Chaldæans, and Strabo brings them from the neighbourhood of the Persian Gulf. Their religion, as has been already observed, appears to have

* For a more complete examination of the narrative in Diodorus Siculus, see O'Brien's Round Towers, chaps. iv. and xxvii. Toland, however, conceives the island of the Hyperboreans to be "the great island of Lewis and Harris, with its appendages, and the adjacent island of Skye," in the Hebrides. (History of the Druids, p. 155, &c.) Davies is decidedly of opinion that it was Great Britain. (Celtic Researches, 181–199, and Appendix, 549, &c.) There is a curious article on Abaris in Bayle's Dictionary.

* The identity of the Celtic people and the Persians, and of the Celtic and Persian languages, is also considered by Pelloutier as admitting of no doubt. See his Histoire des Celtes.

† This interpretation was first published by the late General Vallancey, by whom, however, it appears to have been obtained, though that fact was not acknowledged, from a manuscript of an Irish scholar of the name of Neachtan. It is given in the most complete form in Sir W. *Betham's Gael and Cymbri*, pp. 112–138.

been the same Cabiric or Guebre worship which prevailed among the ancient Persians.

The popular tradition brings the progenitors of the people of Ireland immediately from Spain, making that country one of the principal resting-places of the Gaelic or Milesian race in their progress from the East. This view also would sufficiently harmonize with the supposition that Ireland was indebted for its earliest civilization and its language to the Phœnicians, who had settlements in Spain, and are expressly stated by Strabo and other ancient writers to have carried on a trading intercourse from very remote times with the British Islands. The Irish traditional history, however, it is to be observed, brings the Spanish colonizers of the country not from Gades, which Strabo speaks of as the place from which the voyages to Britain were chiefly made, but from Gallicia, at the opposite extremity of Spain. Particular mention is made of a lighthouse which stood in the neighbourhood of the port now called Corunna, and was of great service in the navigation between that coast and Ireland; and a remarkable coincidence has been noticed between this part of the tradition and an account given by Æthicus, the cosmographer, of a lofty pharos, or lighthouse, standing formerly on the sea-coast of Gallicia, and, as his expressions seem to imply, serving as a beacon in the direction of Britain. Whatever may be thought, indeed, of the share that either the Phœnicians or some other eastern people may have had in colonizing Ireland, or at least in communicating to the country its earliest civilization and religion, little doubt can be entertained that the great body of the Celtic progenitors of its present population was derived, not, as in the case of Britain, from Gaul, but from Spain. Even some of the British tribes, as we have already hinted, were probably of Spanish extraction. Tacitus, as has been observed above, conjectures that the Silures, who inhabited the south of Wales, had come from Spain, from their swarthy countenances, their curled hair, and the position of the district in which they dwelt, facing that country. Ireland, from its position, in like manner, offered the most inviting field for the occupation of colonists from the same quarter. Many of the names of the ancient Irish tribes, as recorded by Ptolemy, are the same with those of tribes forming part of the Spanish population. "So irresistible, indeed," observes Mr. Moore, "is the force of tradition in favour of a Spanish colonization, that every new propounder of an hypothesis on the subject is forced to admit this event as part of his scheme. Thus Buchanan, in supposing colonies to have passed from Gaul to Ireland, contrives to carry them first to the west of Spain; and the learned Welsh antiquary, Lhuyd, who traces the origin of the Irish to two distinct sources, admits one of those primitive sources to have been Spanish. In the same manner, a late writer,* who, on account of the remarkable similarity which exists between his country's Round Towers and the Pillar-temples of Mazanderan, deduces the origin of the Irish nation from the banks of the Caspian, yields so far to the current of ancient tradition, as, in conducting his colony from Iran to the west, to give it Spain for a resting-place. Even Innes, one of the most acute of those writers who have combated the Milesian pretensions of the Irish, yet bows to the universal voice of tradition in that country, which, as he says, peremptorily declares in favour of a colonization from Spain." *

At the same time, as Mr. Moore has elsewhere remarked, there are sufficient evidences that Gothic tribes from Germany have effected settlements in Ireland as well as the Celts from Spain. This would be proved by Ptolemy's map of the country alone, in which there are several tribes set down whose names clearly indicate them to have been of Teutonic origin. There is every reason to believe, indeed, as we shall have occasion to show in the sequel, that the most famous of all the Irish tribes, the Scots,—a people who seem to have eventually established a dominion over all the other races in the island,—were not Celts, but Germans or Goths. Notwithstanding these mixtures, however, the mass of the population remained essentially Celtic, as it had been from the first; and so thoroughly was the Celtic character impressed upon and worked into the whole being of the nation, that it speedily fused down, and assimilated everything foreign with which it came in contact. "It cannot but be regarded as a remarkable result," observes Mr. Moore, "that while, as the evidence adduced strongly testifies, so many of the foreign tribes that in turn possessed this island were Gothic, the great bulk of the nation itself, its language, character, and institutions, should have remained so free from change; that even the conquering tribes themselves should, one after another, have become mingled with the general mass, leaving only in those few Teutonic words, which are found mixed up with the native Celtic, any vestige of their once separate existence. The fact evidently is, that, long before the period when these Scythic invaders first began to arrive, there had already poured, from the shores of the Atlantic into the country, an abundant Celtic population, which, though but too ready, from the want of concert and coalition, which has ever characterized that race, to fall a weak and easy prey to successive bands of adventurers, was yet too numerous, as well as too deeply imbued with another strong Celtic characteristic, attachment to old habits and prejudices, to allow even conquerors to innovate materially either on their language or their usages." †

According to Sir William Betham, the proper Celtic name of Ireland is not, as commonly stated, Erin, but Eire, of which Erin is the genitive, and which is pronounced precisely as Iar, a word still in common use, and signifying the west, the end, everything last, beyond, the extremity. So, he observes, we find by the Periplus of Hanno

* History of Ireland, i. 18. † Ibid. i. 98.

that the last Phœnician settlement on the west coast of Africa was called Cerne, pronounced Kerne, or Herne, being the same word with Erin. Strabo also tells us that the promontory forming the most western point on the coast of Spain was called Ierne. Ierne and Iernis are among the forms which the Celtic name of Ireland assumes in the pages of the Greek and Roman authors. The same original has, without doubt, also given rise to the forms Juvernia and Hibernia, and to the common Latin names for the people Hiberni and Hiberniones. The derivation of the Celtic name of Ireland from a word signifying the extremity, or the remotest point, is as old as the time of Camden.

It is an important part, however, we ought to note, of Mr. O'Brien's theory, that this name is nearly the same word with Iran, the old and still the native name of Persia. Iran, he says, means the Sacred Land, and Irin the Sacred Island. In support of this explanation he quotes a statement by Sir John Malcolm, to the effect that he had been told by a learned Persian that Eir or Eer signified in the Pahlavi, or court dialect of Persia, a believer, and that that was the root of the name of the country. The uniform spelling of Erin, or Irin, in the oldest manuscripts, according to Mr. O'Brien, is Eirin.*

III. The most ancient name by which the northern part of Britain was known, appears to have been Caledonia. We have no evidence, however, that this name was in use among the inhabitants of the country themselves. It seems to have been that which was employed to designate them by the southern Britons, from whom no doubt the Romans learned it. Caoill signifies wood in Celtic, as κᾶλον, *kalon*, (which appears to be the same word,) does in Greek; and the Caledonii of the Roman writers has been supposed, with much probability, to be merely a classical transformation of Caoill daoin, literally, the people of the woods, or the wild people. The meaning of the term, indeed, is exactly expressed by the modern word *savages*, in French *sauvages*, in Italian *selvaggie*, the original of which is the Latin *silva*, a wood.

If it could be shown that the northern Britons of the time of the Romans called themselves Caledonians, or Caoill daoin, this circumstance would afford some evidence that they were a Celtic people. But the name in itself, if the commonly received interpretation of it be correct, does not appear to be one which a people would be very likely to adopt as their national appellation. Notwithstanding this probably Celtic name, therefore, by which they were known to the Romans and to the southern Britons, the Caledonians may not have been a Celtic race.

As the south of Britain was in all probability chiefly peopled from Gaul, and Ireland chiefly from Spain, so it has been conjectured that the main source of the original population of North Britain was in like manner the part of the continent immediately opposite to it, namely, the north of what was then called Germany, including modern Holland and Denmark, and also Norway and Sweden, or the region anciently comprehended under the general name of Scandinavia. Tacitus, as already noticed, expressly tells us that the red hair and big bones of the Caledonians asserted their German origin. If this view be correct, the earliest occupants of the North of Britain were a people not of Celtic, but of Teutonic race.

In the later days of the Roman domination the name Caledonians appears to have gradually fallen into disuse, and in their stead the Picts appear on the scene. Everything connected with the Picts—their name, their language, their origin, their final history—has been made the subject of long and eager controversy. But it may now be said to be agreed on all hands that, whether we are to consider them as having been Gothic or Celtic, the Picts were really of the same stock with the Caledonians.

The Picts are mentioned for the first time about the beginning of the fourth century, by Eumenius, the author of a Panegyric on the Emperor Constantine, who speaks of the Caledonians as being a tribe of Picts: Caledones aliique Picti—the Caledonians and the other Picts—is his expression. About a century later Ammianus Marcellinus describes the Picts as divided into two nations, the Dicaledones, or, according to another reading, Deucaledones, and the Vecturiones. Upon this passage, a late writer, who holds that both the Caledonians and the Picts were Celts, observes—"The term *Deucaledones* is attended with no difficulty. *Duchaoilldaoin* signifies, in the Gaelic language, the real or genuine inhabitants of the woods. *Du*, pronounced short, signifies *black;* but pronounced long, signifies *real, genuine;* and in this acceptation the word is in common use; *Du Erinnach, a genuine Irishman; Du Albinnach, a genuine Scotsman.* The appellation of *Deucaledones* served to distinguish the inhabitants of the woody valleys of Albinn, or Scotland, from those of the cleared country on the east coast of Albinn, along its whole extent, to certain distances westward along its mountains in the interior parts of the country. These last were denominated, according to Latin pronunciation, *Vecturiones;* but in the mouths of the Gael, or native inhabitants, the appellation was pronounced *Uachtarich.*"* We do not find, however, that any explanation of this last term is attempted further than the following:—"That a portion of the country was known in ancient times by the name of *Uachtar*, is evinced by the well-known range of hills called Druim-Uachtar, from which the country descends in every direction towards the inhabited regions on all sides of that mountainous range." † Sir William Betham, also, explaining the names recorded by Marcellinus from the Welsh, will have the

* The Round Towers, chap. ix.

* Thoughts on the Origin and Descent of the Gael. By James Grant, Esq. of Corrimony. 8vo. Lond. 1828, p. 276.

† Ibid. p. 277.

Dicaledones to mean the separated Caledonians; *di*, he says, in that language, having the same disjunctive effect with the particle *dis* in English; while he considers Vecturiones to come from the two words *Uc*, chief, and *Deyrn*, lord, and to signify a superior realm, or the chief district, the residence of the *Ucdeyrn*, or sovereign prince. Pinkerton considers the Latin Vecturiones to be a corruption of Peohtar or Pehtar, which is the form in which the name Picts was anciently written.* Chalmers, also, derives the Latin appellation from the old name of the Picts, which he conceives to have been *Peithi*, or Peithwyr, a word that in Welsh is said to signify those that are out or exposed, the people of the open country.† In Scotland the name is still pronounced Pechts, or Pechs, with a strong enunciation of the guttural. After all, the name Picti may not improbably be merely the common Latin term signifying *painted*, bestowed upon the northern barbarians, from their custom of dyeing or tatooing their bodies, for the existence of which there is abundant evidence. The Latin writers themselves seem to have generally understood the name in this sense.

With regard to the language of the Picts, Bede, writing while that name was still their recognized national designation, distinctly informs us that it was different from that of the Britons. He has also preserved one Pictish word, and that does not belong to the Gaelic either of Ireland or Scotland. So, when the Irish saint, Columba, in the sixth century, went to the court of the Pictish king, for the purpose of converting that Prince and his subjects to Christianity, it is expressly recorded by his biographer, Adomnan, in more than one passage, that he employed an interpreter. But the strongest proof of all is derived from the old names of places, which throughout the whole of that part of Scotland formerly constituting the kingdom of the Picts, are not Irish or Gaelic, but belong to another language. The same is also the case with the names of the Pictish kings, several lists of which have been preserved. The people therefore that originally occupied the territory in question would appear not to have been a Celtic race.

The kingdom of the Picts, which subsisted under that designation in an independent state, till the middle of the ninth century, extended, as is well known, along the east coast of Scotland, from the Firth of Forth northwards. As for the country to the south of the Forth and the Clyde, it did not properly belong to ancient Scotland at all. But while the Picts thus occupied the lowland country, the hilly country to the west was undoubtedly in the possession of a people of genuine Celtic lineage, the progenitors of the present Scottish Highlanders. Of those writers who consider the Caledonians to have been Celts, several hold that the modern Highlanders are the descendants of those earliest occupants of North Britain. This, for instance, is the view propounded by Mr. James Macpherson in the introduction prefixed to his celebrated translation of the Poems of Ossian (1762), and also by his relation, Dr. James Macpherson, in his Dissertations on the Caledonians, &c. which the translator of Ossian edited (1768). Yet both these writers contend that the Picts also were the descendants of the same Caledonians; or, in other words, that the Highlanders and the Lowlanders were really the same people—a fact which would make it extremely difficult to account for the complete distinction between the two, which we find preserved in all the historical notices that have come down to us respecting them. The Scottish Highlanders consider themselves to be of Irish descent, as Dr. James Macpherson admits. In these respects their own traditions perfectly agree with the uniform voice of the traditional history of Ireland. It may now indeed be said to be admitted on all hands that the Scottish Highlanders are the descendants of a band of Irish who settled in Argyleshire about the middle of the third century, under a leader named Carbry Riada, the lord of a territory in Antrim, named after himself, Dalriada. The descendants of these Irish colonists, about the beginning of the sixth century, founded in that district of Scotland what was long called the Dalriadic kingdom, or kingdom of the Dalreudini, and which eventually, on the seizure of the Pictish throne, by Kenneth Macalpine, in the year 843, became the kingdom of all Scotland. This is the view concurred in by Innes, O'Connor, Chalmers, and all the ablest modern inquirers.

Indeed, until the appearance of the publications of the Macphersons, the Irish origin of the Scottish Highlanders does not appear ever to have been doubted or called in question either among themselves or by others. Their own name for their language is Erse or Ersh, that is, Irish. They designate themselves Gael, and they call the Irish by the same name at this day.

Of the origin and meaning of the term Gael, it does not appear possible to give any satisfactory account. The Irish tradition is that the name is derived from Gaodhal (pronounced Gael), grandson of Feine Farsa, the first great leader of the colony, variously designated Milesian, Scotic, Gaelic, and Phœnician, from which the Celtic population of Ireland is sprung. It has been supposed by some that the word Gael, or Galli, is really the same with Celtæ (pronounced Keltæ), as well as with Galatæ, the name given to the inhabitants of Galatia, or Gallo-Græcia, in Asia Minor. Sir William Betham conceives that the Phœnicians, long before the Christian era, called themselves Gael and Gaeltach, from the latter of which names the Greeks and Romans formed their Keltoi and Celtæ. Others, however, think Celtæ to be a corruption of *Caoiltich*, which signifies a woodland people, from *Caoill*, wood, already mentioned. The commonly received classical derivation of the name Celts is from the old Greek word, used by Homer, Κελης, *Keles* (originally *Kelets*), a

* Inquiry into the History of Scotland preceding the Reign of Malcolm III.
† Caledonia, i. 203.

horse, the Celts being, it is said, everywhere distinguished for their skill in horsemanship. Perhaps the word ought rather to be deduced at once from the verb Κελλω, *Kello*, to move about, from which Κελης is itself considered a derivative. The wandering character of the race would go to vindicate this etymology; but we do not know that there is any Celtic word corresponding in sound and sense to the Greek Κελλω. Cæsar tells us that the people of ancient France, whom the Romans called Galli, were called Celtæ in their own language; and Pausanias also testifies that the ancient name of the Gauls was Celts. Herodotus, who mentions the Celts, is silent as to the Gauls.

The words Gael and Galli have also been by some supposed to be identical with the modern names Waldenses or Walloons, and Waelsh or Welsh. Nothing certainly is more common than the conversion of the sound *g* into *w* or *gw*, and therefore the name Waelsh, by which the Saxons were latterly wont to designate the alien race who occupied the western corner of South Britain, might possibly be merely a corruption of Gael. At the same time, as the Welsh never have called themselves Gael, it would be somewhat difficult to account for the Saxons bestowing upon them that name, if it was thereby intended to identify them with the Gael of Ireland and of Scotland. There can be no doubt that the word Welsh is the same with the modern German Waelsch, which is still applied in that language to designate generally all strangers or foreign nations. The Italians, in particular, are called at this day Waelsch or Welsch by the Germans, their language the Welsh tongue, and their country Welsh land. Precisely in the same way our German ancestors, the Saxons, called the race of distinct blood and language who occupied the west of England Welsh, and the district they inhabited Wales.

What original connexion there may have been between the two words Gael and Waelsh (or Wael, as it may perhaps have been in its simplest form), when the Celtic and Teutonic tongues were less widely divided than they eventually came to be, we shall not take upon us to conjecture. If any relationship could be established, it might perhaps help us to the true meaning of the name Gael. It is worth remarking that there appears to be another genuine Celtic word, which, from the similarity of its sound, is apt to be confounded with the word Gael, but to which is attributed exactly the signification of the German Waelsch. This fact is obscurely noticed by Buchanan, who states that the ancient Scots divided all the nations of Britain into *Gaol* and *Galle*, which names he translates by the Latin Galli and Gallaeci. But the matter is more clearly explained in the following passage from a modern work:—"*Gaoll*, in the Gaelic language, signifies *a stranger*. All the inhabitants of the kingdom of Scotland, whose native language is not Gaelic, are by the Gael called *Gaoill; Gaoll*, nom. singular; *Gaoill*, nom. plural, that is, *strangers;* so *Gaolldoch* is the country of the Scots who speak English, as *Gaeldoch* is the country of the Highlanders who speak Gaelic. Caithness, that part of the northern extremity of Scotland which has been for many centuries inhabited by Anglo-Saxon colonies, is called by the Gael, *Gaollthao*, *the quarter of strangers;* and, for the same reason, the Hebrides, after their conquest by the Danes, got the name of Insegaoll, which signifies *the islands inhabited by strangers*. Circumstances of a like nature gave the names of Galloway and Galway to the districts of country known by these appellations in Scotland and Ireland." * The author of 'Britannia after the Romans' conceives that Wal and Gaul are the same word, and is convinced "that the words Wal, Wealh, Welsch, and Walsch were all primarily applied to that extensive family of tribes which we distinguish from the Teutonic towards the west, and that whenever it obtained the general force of *stranger* or *foreigner*, it had been among such tribes of Teutons as had then little collision with any other description of foreigners." † But how will this theory account for the Gael themselves calling foreigners *Gaoll?*

But all this while who and whence were the Scots? and from whom has North Britain received the name of Scotland? In the first place, it is to be observed, that down to the eleventh or twelfth century the name Scotia was appropriated not to what is now called Scotland but to Ireland, and by the Scots was meant the Irish, or at least a people dwelling in that country. This is now universally admitted. The Scots are first mentioned by Ammianus Marcellinus under the year 360, as fighting in alliance with the Picts. If these Scots were a British people, they must be supposed to have been a portion of that band of colonists from Ireland, who, as already mentioned, had a short time before this obtained a settlement in Argyleshire. But it is far from being certain that the Scots spoken of by Marcellinus, and whom, on another occasion, he describes as *per diversa vagantes*—vagabondizing from one place to another, as the words may be translated—were not native Irish who had come over expressly for the purpose of the predatory expeditions in which they are represented as having been engaged. We find, at any rate, that the tribes of the north of Britain were sometimes joined in their attacks upon the Roman province by bands of Scots, who are expressly stated to have come from Ireland. Thus, the poet Claudian, describing the chastisement inflicted by Theodosius, in the year 368, upon the Saxons, Picts, and Scots, says that of the last-mentioned people icy Ireland (glacialis Ierne) wept the heaps that were slaughtered. We have seen above that the notion of Ireland commonly entertained among the Greeks and Romans was that the island was situated very far to the north, which accounts for the epithet here made use of. Another expression in the poem, proceeding from the same misconception, occurs in the passage in which it is affirmed that

* Grant's Origin of the Gael, p. 154.
† Britannia after the Romans, p. lxxviii.

Theodosius, in pursuing the flying Scots, broke with his daring oars the Hyperborean waves. This may remind us of the island of the Hyperboreans, commemorated by Diodorus Siculus. In like manner, in another poem, in which he celebrates the exploits of Stilicho, about thirty years later, on the same scene of war, he makes Britannia exclaim, " By him was I protected "—

" totam cum Scotus Iernen
Movit, et infesto spumavit remige Tethys—"

that is, as it has been translated by Dr. Kennet in Gibson's Camden,

" When Scots came thundering from the Irish shores,
And the ocean trembled, struck with hostile oars."

It may be considered, then, not to admit of any dispute, that the Scots were originally an Irish people. " It is certain," observes Camden, " that the Scots went from Ireland into Britain. Orosius, Bede, and Eginhard bear indisputable testimony that Ireland was inhabited by the Scots." Bede, indeed, who yet had never heard of North Britain being called Scotland, expressly informs us that the nation of the Scots first came into that part of Britain which belonged to the Picts, from Ireland, under their leader Reuda—the Riada mentioned in a preceding page. As the country eventually received its kings, so it also received its name from these Irish colonists. The proper Scots, accordingly, Camden describes to be those commonly called Highlandmen; " for the rest," he adds, " more civilized, and inhabiting the eastern part, though comprehended under the name of Scots, are the farthest in the world from being Scots, but are of the same German origin with us English." The name Scot has been usually supposed to be the same with Scythian, and to be a Celtic term signifying a scattered or wandering people. It has been suggested, however, that it may be a truncated form of the Welsh Ysgo-do-gion or Ysgotiaid, which names appear to have been applied to the Scots by the Welsh in the twelfth century, and to be derived from Ysgawd, signifying shade, as if meaning a people of the woods.* We doubt, at all events, the derivation from Ysgawd.

But having found the Scots settled in Ireland before they were known in Britain, we have still to endeavour to discover when and whence they found their way to the former country; and these are much darker questions. The Irish traditionary account, as we have seen, is, that the Scots, or the Milesians, were that great nation who, arriving in Ireland, many centuries before the birth of Christ, brought with them the present Irish or Gaelic language, and became the progenitors of the great body of the present Irish population. But, to pass over all the other improbabilities involved in this legend, it is sufficient to remark, that the account of the geography of Ireland given by Ptolemy, sufficiently proves that there were no Scots in Ireland at the time when Marinus of Tyre collected the materials from which that writer drew his information. And still more decisive is the evidence of a work of unquestioned authenticity, " The Confession of St. Patrick," written so recently as the middle of the fifth century, from a passage in which it appears that even then the Scots were a distinct race from the Hiberionaces, or great body of the Irish people. The manner, however, in which they are here spoken of, as well as the ascendancy which their name afterwards acquired, would seem to imply that they formed a superior class; and the probability is, that they were really a foreign people who, perhaps a century or two at most before our era, had effected a settlement in the country by force, and eventually reduced the natives to subjection. One supposition, that proposed by Whitaker in his History of Manchester, is, that the Scots were emigrants from Britain, and consequently Celts; but this hypothesis is entirely unsupported by evidence, and is directly contrary to the uniform tenor of the Irish tradition respecting the people in question, which peremptorily asserts them to have been of Scythic or Germanic race. Pinkerton, Wood (in his " Inquiry into the Primitive Inhabitants of Ireland "), and others, conceive the Scots to have been Belgians; but the whole course of early Irish history, as Mr. Moore has remarked, " runs counter to this conjecture—the Belgæ and Scoti, though joining occasionally as allies in the field, being represented throughout as distinct races." On the whole, we are disposed to agree with this last-mentioned writer, that the Scots were really a tribe of Scythians, that is, a people from Germany, or the north of Europe, who arrived in Ireland subsequently to the Firbolgs or Belgæ, and that they were therefore of Teutonic blood and language. Although they appear to have in course of time reduced all the other inhabitants of the island under their authority, and to have given their name to the whole country, their numbers were probably very small as compared with those of the original Celtic population. Hence the language of the country continued to be Celtic, and eventually, both in this and in other particulars, the conquering tribe came to be melted down among the mass of those whom it had subdued—just as after the Norman invasion England still continued to be essentially a Saxon country. It is not therefore necessary to conclude from the facts of the Highlanders of North Britain being sprung from a colony of Irish, and of that country inheriting from Ireland the name of Scotland, that the Irish progenitors of the Scottish Highlanders were of the Scotic race properly so called; long before the name of Scoti was transferred to the Highlanders of North Britain, it had entirely lost its original distinctive meaning, and was applied to all the people of Ireland indiscriminately. The Irish colonists of Scotland, for anything that is known, may not have even had a drop of Scotic or Scythic blood in their veins. It is certain, at least, that they were Celts or Gael in speech, and that their descendants to this day have never called themselves Scots, or anything else but Gael.

In distinguishing themselves from the Irish, the

* Britannia after the Romans, p. lxiii.

Scottish Highlanders designate that people *Gael Erinnich*, or Gael of Erin, and themselves *Gael Albinnich*, or Gael of Albin. *Albin*, or Albion, appears to have been anciently the name of the whole island of Great Britain, and that by which it was first known to the Greeks and Romans. The writer of the geographical treatise ascribed to Aristotle, to which we have referred in a former page, says that the two British islands were called Albion and Ierne. Pliny intimates that, the whole group of islands being called Britannia, the former name of that then called Britannia was Albion. Eustathius, the commentator on the Greek geographical poem of Dionysius Periegetes, tells us that the British islands are two in number, *Ouernia* and *Alouion*, or *Bernia* and *Albion*. Albinn, according to Mr. Grant, means in Gaelic *white* or *fair island*. "The Gael of Scotland and Ireland," he observes, "never knew any other name for Scotland than that of *Albinn;* it is the name used by them at this day; the appellation of Scotia, or any appellation similar to it in sound, is entirely unknown to them. The Gael have preserved, and apply at this day to the kingdom of Scotland, the most ancient name known to the Greeks and Romans, to denominate the whole island of Great Britain. The etymology of the name serves to show that it was denominated Albinn by the continental Gauls, and was naturally called by them the Fair or White Island, from the chalky appearance of the British coast opposite to the nearest part of the coast of ancient Gaul." * An old name given to the island by the Welsh is stated to have been *Innis-wen*, which also in their language signifies the Fair or White Island.†

IV. The Welsh, as every one is aware, have been in the habit of regarding themselves as the genuine descendants and representatives of the ancient Britons, who possessed the whole of the southern portion of the island before the arrival of the Saxons, and were indeed the same people that inhabited the country when it was first invaded by the Romans, and had probably occupied it for many preceding centuries. This descent being assumed, the Welsh language has generally been held to be a Celtic dialect, and essentially the same that was spoken by the original Britons, only mixed with some words of Latin derivation, which it is supposed to have received from the intercourse of those who used it with the Roman colonists.

It would probably be difficult to produce any direct evidence for these notions; but they have been, until very recently, the almost universally received faith among the students of British antiquities.

Yet it is certain, in the first place, that no trace is to be found in the notices of Britain by the Greek or Roman writers, of any people or tribe settled in the district now called Wales, from which the Welsh can with any probability be supposed to have sprung. They exhibit no marks which would lead us to suspect their progenitors to have been the Silures, whose swarthy countenances and curled hair gave them to Tacitus the appearance of a Spanish race. The Welsh have always called themselves Cymry; there is no resemblance between this name, and either that of the Silures, or that of the Demetæ, or that of the Ordovices, the only British tribes whom we read of, either in Ptolemy, or in any of the historians of the Roman wars, as occupying Wales in the time of the Romans. Indeed, no name resembling the Cymry occurs anywhere in the ancient geography of the island, so far as it is to be collected from these authorities. It is not pretended that this appellation has been adopted by the Welsh since the time of the Romans; if therefore the people bearing it were then in the island, and more especially if they formed, as the common account would seem to imply, the most ancient and illustrious of all the tribes by which the country was occupied, how did it happen that they wholly escaped notice? How are we to account for the fact of tribes with other appellations altogether being set down by contemporary geographers and historians in the very district which the Cymry claim as their proper and ancient residence?

But further, it clearly appears, and has been acknowledged by some of the ablest and most learned of the Welsh antiquaries themselves, that the district now called Wales must have been inhabited in ancient times by another race than the present Welsh. The oldest names of natural objects and localities throughout Wales are not Welsh. This was long ago stated by Humphrey Lhuyd, and has been since abundantly established.

Lhuyd's statement is that the old names throughout Wales are Irish; and until very lately it was universally assumed that the Welsh and the Irish were only two dialects of the same Celtic speech. It was unquestionable that the Irish and Scottish Gaelic was, as its name imports, the language of the ancient Gael or Celts; and as no doubt was entertained that the Welsh, as descendants of the old Britons, were a Celtic race, it was taken for granted that their language also was only another sister dialect of the Celtic. But it would seem that this too was another notion adopted without any evidence, and indeed in the face of evidence, if it had been looked into, quite sufficient to disprove it. It would not, we apprehend, be possible to quote, in support of the asserted identity of the Welsh and Irish, or Gaelic, the authority of any writer who had really made himself master of the two languages, or even examined them attentively with the view of ascertaining in how far they resembled or differed from

* Thoughts on the Gael, p. 297.

† The author of "Britannia after the Romans," however, contends that we must consider the ancient and correct form of Albion to be Alouion or Alwion. "Neither *p* nor *b*," he is pleased to say, "is capable of mutation into *w*; nor is the converse possible." The Romans, he proceeds, modified the sound of the word "to suit the etymology furnished by their own language, but not existing in the Greek, albus, white. And they harped upon that idea so long, that it was adopted in the island itself while it was their province." Alwion, he is inclined to think, is the Land of Gwion, which appears to have been a name of "the Hermes, or Mercury, whom the ancient Britons revered above all other deities, and who (in the alchemic superstitions) presided over the permutations of nature."—pp. lxiv–lxviii.

each other, and whether they were properly to be regarded as belonging to the same or to different stocks. On the other hand, we have in denial of their relationship the distinctly pronounced judgment both of Welshmen, of Irishmen, and of inquirers having no partialities of origin to influence their conclusions, all speaking upon a question which they have deliberately considered, and which some of them, at least, possessed all the necessary qualifications for deciding. The same opinion that had been first expressed upon the subject by the learned and acute Bishop Percy, an Englishman, has since been maintained as not admitting of any doubt both by the Welsh antiquary Roberts, and the Irish O'Connor, and has also been adopted by the German Adelung, and finally, to all appearance, unanswerably established by Sir William Betham, who has devoted many years to the study of both languages. All these authorities declare in substance that the Cymraeg tongue spoken in Wales, and the Gaelic spoken in Ireland and Scotland, exhibit little resemblance even in vocabulary, and, to use the words of Dr. O'Connor, "are as different in their syntactic construction as any two tongues can be." It may be added, that this seems also to have been the opinion of the late learned General Vallancey.

This view of the Welsh language throws an entirely new light upon other points that have given occasion to a world of controversy. We have already seen that nearly all inquirers are agreed in considering the Picts to have been of the same race with the ancient Caledonians. But it had still continued to be a keenly agitated question, whether the Picts were a Celtic or a Teutonic people. Without entering into any detail of this long controversy, in which the Celtic origin of the Picts has been maintained by Camden, Lloyd (Bishop of St. Asaph), the very learned and able Father Innes, and the late George Chalmers, in his elaborate work entitled "Caledonia," while the opposite side of the question has been supported by Archbishop Usher, Bishop Stillingfleet, and the late John Pinkerton, to whom may be added, Dr. Jamieson, in the Introduction to his Scottish Dictionary; we shall merely remark, that the assertors of the Teutonic lineage of the Picts have evidently all along had the best of the argument on all other grounds, excepting only on the important ground of the evidence afforded by the language of the lost people. All the historical evidence is in favour of their Teutonic or Germanic descent. Still, if it could be clearly proved that they spoke a Celtic language, that single fact would go far to prove them to have been Celts, notwithstanding even all the direct historical testimony there is to the contrary. Now, this Camden and his followers conceive not to admit of any doubt, from the remains of the Pictish language which are still to be collected, and Chalmers especially has, by a minute examination of the old topographical nomenclature of the part of Scotland formerly occupied by the Picts, completely, as he thinks, established the position that their language was Celtic. But how is this demonstration made out? Altogether by the assumption, never for a moment suspected to be unfounded or doubtful, that the ancient British Celtic tongue is still substantially preserved in the modern Welsh. All the instances adduced by Camden, and the much longer list enumerated by Chalmers, are instances of Pictish names of places which are not Irish or Gaelic, but Welsh. Chalmers even shows that on the country, after having been occupied by the Picts, falling into the possession of the Celtic Scots, the Welsh, or, as he calls it, the Cambro-British name was in some cases changed into a Celtic name of the same import. The Welsh Aber, for example, applied to places situated at the mouths of rivers, is found to have in this way given place in several names to the corresponding Gaelic term Inver. In examining the list of the Pictish kings, the same writer observes that the names of those kings are not Irish, and, "consequently," he adds, "they are British:" "they are," he says elsewhere, "undoubtedly Cambro-British." And in like manner, the single Pictish word which Bede has preserved, Pengvahel, the name of the place where the Pictish wall commenced, is acknowledged to be not Gaelic, but Welsh.

The opinion expressed by Camden and Innes, that the Picts were Welsh, may therefore be admitted, without the consequence which they supposed to be involved in it, that either were Celts, being at all established. On the contrary, it would appear from what has been said above, that the fact of the language of the Picts having been the same with that spoken by the present inhabitants of Wales, is the best of all proofs that the former people were not Celts. It comes in confirmation of all the other arguments bearing upon the question, the decided tendency of which is to make it probable that they were a Teutonic race.

Here, then, we have two remarkable facts; the one, that the part of England now occupied by the Cymry, as the present Welsh call themselves, was apparently not occupied by them in ancient times; the other, that the part of Scotland known to have constituted what is called the Pictish kingdom, was in ancient times occupied by a people speaking the same language with the modern Welsh. It seems impossible to resist the conclusion, that the same Cymry who are now settled in the west of England were previously settled in the east of Scotland—in other words, that the present Welsh are the descendants of the Picts.

Usher has, without reference to the evidence of language, and merely upon the strength of the historic testimony and the general probabilities of the case, advanced the opinion that the Picts were Cimbrians. The name of Cymri, borne by the Welsh, has long ago suggested a belief that they are a remnant of the ancient Cimbri. Their own traditions, as we have already seen, make them to have been conducted into Britain by their great leader, Hu Cadarn, across the German Ocean. Bede expressly states that the Picts came from Scythia, a

name which, as is well known, comprehended at one time all the regions forming the north of modern Germany and Denmark, the Cimbric Chersonesus, or Peninsula of Jutland, among the rest. Bede also informs us, that, before arriving in Britain, the Picts were driven towards Ireland, and touched in the first instance at that island. In this relation the venerable Saxon historian is confirmed by the Irish bardic histories, which, in like manner, represent the Picts to have sought a settlement in Ireland, before they resorted to Britain. Finally, it may be mentioned as a curious confirmation of the identity here assumed of the Cimbri and the modern Welsh, that the only word which has been preserved of the language of the former people, namely, the term Morimarusa, which Pliny quotes as meaning the Dead Sea, appears to be Welsh, *Mor* in that language signifying the sea, and *Maru* dead.*

That the Welsh, indeed, were in very ancient times established in Scotland, is matter of authentic and undoubted history. Their kingdom of Strath-clyde, or Reged, otherwise called Regnum Cumbrense, or the kingdom of the Cymry, lay in the south-west of Scotland. There are certainly no probable grounds for believing that there were any Cymry in England till an age subsequent to the establishment of this northern kingdom. "Most of the great Welsh pedigrees," observes Mr. Moore, "commence their line from princes of the Cumbrian kingdom, and the archaiologist Lhuyd himself boasts of his descent from ancestors in the 'province of Reged in Scotland, in the fourth century, before the Saxons came into Britain.' To this epoch of their northern kingdom, all the traditions of the modern Welsh refer for their most boasted antiquities and favourite themes of romance. The name of their chivalrous hero, Arthur, still lends a charm to much of the topography of North Britain; and among the many romantic traditions connected with Stirling Castle, is that of its having once been the scene of the festivities of the Round Table. The poets Aneurin and Taliessin, the former born in the neighbourhood of the banks of the Clyde, graced the court, we are told, of Urien, the king of Reged or Cumbria; and the title Caledonius bestowed on the enchanter Merlin, who was also a native of Strath-Clyde, sufficiently attests his northern and Pictish race." †

We have thus, however cursorily, taken a survey of the subject of the original population of these islands, in its whole extent, and have endeavoured, as we went along, both to note the principal of the various opinions that have been entertained on the many obscure and difficult questions it presents, and to collect, from the lights of history and the evidence of facts together, what appears to be the most consistent and otherwise probable conclusion on each controverted point. The following may be given as a summary of the views that have been offered. Beginning with Ireland, it may be affirmed that everything in that country indicates the decidedly Celtic character of its primitive population; and taking the geographical position of the island along with the traditions of the people, we can have little doubt that the quarter from which chiefly it was originally colonized was the opposite peninsula of Spain. That settlements were also effected in various parts of it, before the dawn of recorded history, by bodies of people from other parts of the continent—from Gaul, from Germany, from Scandinavia, and even possibly from the neighbouring coast of Britain—is highly probable; but although several of these foreign bands of other blood seem to have acquired in succession the dominion of the country, their numbers do not appear in any instance to have been considerable enough to alter the thoroughly Celtic character of the great body of the population, of their language, of their customs, and even of their institutions. Thus, the Scots, who appear to have been originally a Teutonic people from the northern parts of the European continent, although they eventually subjugated the divided native Irish so completely as to impose their own name upon the island and the whole of its inhabitants, were yet themselves more truly subjugated, by being melted down and absorbed into the mass of the more numerous Celtic race among whom they had settled. The invasion of Ireland by the Scots, and the subsequent intermixture of the conquerors with the conquered, resembled the subjugation of Saxon Britain by the Normans, or still more nearly that of Celtic or Romanized Gaul by the Franks, in which latter case the conquerors, indeed, as happened in Ireland, gave their name to the country, but the native inhabitants in turn gave their language to the conquerors. In this manner it happened that the Irish, after they came to be called Scots, were really as much a Celtic or Gaelic people as ever. The Scots from Ireland who colonized the western coast of North Britain, and came at last to give their name to the whole of that part of our island, were undoubtedly a race of Gael. They were called Scots merely because the whole of Ireland had, by that time, come to be known by the name of the country of the Scots, who had obtained the dominion of it. The original population of ancient Caledonia, however, appears to have been of Gothic lineage, and to have come from the opposite coasts of Germany, and what is now called Denmark. Long after the arrival of the Irish Scots in the western part of the country, this original Gothic race, or possibly another body of settlers who had subsequently poured in from the

* We find the following passage in a forgotten, and in most respects sufficiently absurd, book, entitled, "The Pronunciation of the English Language Vindicated," &c., by the Rev. James Adams, 8vo. Edin. 1799:—"The Welsh dialect (of the English language) is characterized by a peculiar intonation, . . . and by the vicarious change of consonants, *k* for *g*, *t* for *d* and *p*, *f* for *v*, and *s* for *z*. . . Now this twang and change being common to the Germans, . . and moreover not being found in Irish or Highland English (the author means the pronunciation of English by the Scotch Highlanders), there is an opening for a curious inquiry I never met with."—pp. 144, 145.

† History of Ireland, p. 103. The view that has been taken of the origin of the Welsh is substantially the same with that given both by Mr. Moore and by Sir William Betham.

same quarter, retained, under the name of the Picts, the occupation and sovereignty of by far the greater portion of what is now called Scotland. But most probably some ages before they were deprived of their Scottish sovereignty by the successful arms or intrigues of the king of the Highland Gael, bands of Picts appear to have established themselves in the west of England, where they came eventually to be known to their Saxon neighbours by the name of the foreigners, or the Welsh. The Welsh, however, still do and always have called themselves only the Cymry, which appears to be the same name with that of the Cimbri or Cimmerii, so famous in ancient times; and taking this circumstance, along with the tradition they have constantly preserved of their original emigration into Britain from a country on the other side of the German Ocean, there seems to be every reason for concluding that the Cymry of Britain, called by their neighbours of other blood at one time Picts (whatever that name may mean), at another Welsh, are really the remnant of the Cimbri of antiquity. There remains only to be noticed the original population of the rest of South Britain, or of that part of the island now properly called England. It can hardly admit of a doubt that the whole of the south of Britain was originally colonized mainly from the neighbouring coast of Gaul. Some bands of Germans may have settled along the east coast, and some Celtic tribes from Spain may have established themselves in the west; but the great body of the inhabitants by whom the country was occupied when it first became known to the Romans were in all probability Celts from Gaul. We are inclined to think that even the Belgic tribes who, some centuries before Cæsar's invasion, appear to have obtained the possession of the greater part of the south coast, were either really of mixed German and Celtic lineage, or had adopted the Celtic tongue from the previous occupants of the territory, with whom they intermixed after their arrival in Britain, and who were probably much more numerous than their invaders. There does not seem to be any evidence either that what are called the Belgic tribes of Britain spoke a different language from the rest of the natives, or that any people speaking a Gothic dialect had ever been spread over any considerable portion of the south of Britain in those early times.

BOOK I.

THE BRITISH AND ROMAN PERIOD; FROM B.C. 55 TO A.D. 449.

CHAPTER I.

NARRATIVE OF CIVIL AND MILITARY TRANSACTIONS.

THE conquests of Julius Cæsar in Gaul brought him within sight of the coast of Britain, and having established the Roman authority in the nearest countries on the continent, which are now called France and Belgium, it was almost as natural for him to aim at the possession of our island as for the masters of Italy to invade Sicily, or the conquerors of India the contiguous island of Ceylon. The disjunction of Britain from the rest of the world, and the stormy but narrow sea that flows between it and the main, were circumstances just sufficient to give a bold and romantic character to the enterprise, without being real barriers to a skilful and courageous general. But there were other motives to impel Cæsar. Britain, or the far greater part of it, was inhabited by a people of the same race, language, and religion as the Gauls, and during his recent and most arduous campaigns the islanders had assisted their neighbours and kindred of the continent, sending important aid more particularly to the Veneti, who occupied Vannes in Bretagne, and to other people of Western Gaul who lived near the sea-coast. Cæsar, indeed, says himself that in all his wars with the Gauls the enemies of the Republic had always received assistance from Britain, and that this fact made him resolve to pass over into the island. This island, moreover, seems to have had the character of a sort of Holy Land among the Celtic nations, and to have been considered the great centre and stronghold of the Druids, the revered priesthood of an iron superstition that bound men, and tribes, and nations together, and inflamed them even more than patriotism against the Roman con-

querors. With respect to Druidism, Britain perhaps stood in the same relation to Gaul that the island of Mona or Anglesey bore to Britain; and when the Romans had established themselves in Gaul they had the same motives for attacking our island that they had a century later when they had fixed themselves in Britain, for falling upon Anglesey, as the centre of the Druids and of British union, and the source of the remaining national resistance.

It is to be remembered, also, that, whatever may have been the views of personal ambition from which Cæsar principally acted, the Romans really had the best of all pleas for their wars with the Gauls, who had been their constant enemies for centuries, and originally their assailants. Their possession of Italy, indeed, could not be considered as secure until they had subdued, or at least impressed with a sufficient dread of their arms, the fierce and restless nations both of Gaul and Germany, some of whom—down almost to the age of Cæsar—had not ceased occasionally to break through the barrier of the Alps, and to carry fire and sword into the home territories of the republic. These and the other northern barbarians, as they were called, had had their eye upon the cultivated fields of the Italic peninsula ever since the irruption of Bellovesus in the time of the elder Tarquin; and the war the Gauls were now carrying on with Cæsar was only a part of the long contest which did not terminate till the empire was overpowered at last by its natural enemies nearly five centuries afterwards. In the meantime it was the turn of the Gauls to find the Roman valour, in its highest condition of discipline and efficiency, irresistible; and the Britons, as the active allies of the Gauls, could not expect to escape sharing in their chastisement.

According to a curious passage in Suetonius, it was reported that Cæsar was tempted to invade Britain by the hopes of finding pearls.* Such an inducement seems scarcely of sufficient importance, although we know that pearls were very highly esteemed by the ancients, and Pliny, the naturalist, tells us that Cæsar offered or dedicated a breastplate to Venus ornamented with pearls which he pretended to have found in Britain. But Cæsar might be tempted by other real and more valuable productions, and he could not be ignorant of the existence of the British lead and tin which the Phœnicians had imported into the Mediterranean ages before his time, and in which the Phocæan colony of Massilia or Marseilles was actually carrying on a trade. Cæsar himself, indeed, says nothing of this; but within a few miles of our coasts, and among a people with whom the British had constant intercourse, he must have acquired more information than appears respecting the natural fertility of the soil, and the mineral and other productions of the island. From evident reasons, indeed, the Gauls in general might not be very communicative on these subjects; but among that people Cæsar had allies and some steady friends, who must have been able and ready to satisfy all his inquiries. His subservient instrument Comius, who will presently appear upon the scene, must have possessed much of the information required. His love of conquest and glory alone might have been a sufficient incentive to Cæsar, but a recent and philosophic writer assigns other probable motives for his expeditions into Britain,—such as his desire of dazzling his countrymen, and of seeming to be absorbed by objects remote from internal ambition by expeditions against a new world, or of furnishing himself with a pretence for prolonging his provincial command, and keeping up an army devoted to him, till the time should arrive for the execution of his projects against liberty at Rome.*

Julius Cæsar.
From a Copper Coin in the British Museum.

Whatever were his motives, in the year 55 before Christ, Cæsar resolved to cross the British Channel, not, as he has himself told us, to make *then* a conquest, for which the season was too far advanced, but in order merely to take a view of the island, learn the nature of the inhabitants, and survey the coasts, harbours, and landing-places. He says that the Gauls were ignorant of all these things; that few of them, except merchants, ever visited the island; and that the merchants themselves only knew the sea-coasts opposite to Gaul. Having called together the merchants from all parts of Gaul, he questioned them concerning the size of the island, the power and customs of its inhabitants, their mode of warfare, and the harbours they had capable of receiving large ships. He adds, that on none of these points could they give him information; but, on this public occasion, the silence of the traders probably proceeded rather from unwillingness and caution than igno-

* Vit. Jul. Cæs. ch. 47.

* Sir James Mackintosh, Hist. Eng. vol. i. p. 12.

rance, while it is equally probable that the conqueror received a little more information than he avows. He says, however, that for these reasons he thought it expedient, before he embarked himself, to dispatch C. Volusenus, with a single galley, to obtain some knowledge of these things; commanding him, as soon as he had obtained this necessary knowledge, to return to head-quarters with all haste. He then himself marched with his whole army into the territory of the Morini, a nation or tribe of the Gauls who inhabited the sea-coast between Calais and Boulogne,—"because thence was the shortest passage into Britain." Here he collected many ships from the neighbouring ports.

Meanwhile many of the British states having been warned of Cæsar's premeditated expedition by the merchants that resorted to their island, sent over ambassadors to him with an offer of hostages and submission to the Roman authority. He received these ambassadors most kindly, and exhorting them to continue in the same pacific intentions, sent them back to their own country, dispatching with them Comius, a Gaul, whom he had made king of the Atrebatians, a Belgic nation then settled in Artois. Cæsar's choice of this envoy was well directed. The Belgæ at a comparatively recent period had colonized, and they still occupied, all the south-eastern coasts of Britain; and these colonists, much more civilized than the rest of the islanders, no doubt held frequent commercial and friendly intercourse with the Atrebatians in Artois, and the rest of the Belgic stock settled in other places. Cæsar himself says not only that Comius was a man in whose virtue, wisdom, and fidelity he placed great confidence, but one "whose authority in the island of Britain was very considerable." He therefore charged Comius to visit as many of the British states as he could, and persuade them to enter into an alliance with the Romans; informing them, at the same time, that Cæsar intended to visit the island in person as soon as possible.

C. Volusenus appears to have done little service with his galley. He took a view of the British coast as far as was possible for one who had resolved not to quit his vessel or trust himself into the hands of the natives, and on the fifth day of his expedition returned to head-quarters. With such information as he had Cæsar embarked the infantry of two legions, making about 12,000 men, on board eighty transports, and set sail from Portus Itius, or Witsand, between Calais and Boulogne. The cavalry, embarked in eighteen other transports, were detained by contrary winds at a port about eight miles off, but Cæsar left orders for them to follow as soon as the weather permitted. This force, however, as will be seen, could never make itself available, and hence mainly arose the reverses of the campaign.

At ten o'clock on a morning in autumn (Halley, the astronomer, in a paper in the Philosophical Transactions, has almost demonstrated that it must have been on the 26th of August) Cæsar reached the British coast, near Dover, at about the worst

DOVER CLIFFS.

Landing of Julius Cæsar.—After a Picture by Blakey.

possible point to effect a landing in face of an enemy, and the Britons were not disposed to be friends. The submission they had offered through their ambassadors was intended only to prevent or retard invasion; and seeing it fail of either of these effects, on the return of their ambassadors with Comius, as Cæsar's envoy, they made that prince a prisoner, loaded him with chains, prepared for their defence as well as the shortness of time would permit; and when the Romans looked from their ships to the steep white cliffs above them, they saw them covered all over by the armed Britons. Finding that this was not a convenient landing-place, Cæsar resolved to lie by till the third hour after noon, in order, he says, to wait the arrival of the rest of his fleet. Some laggard vessels appear to have come up, but the eighteen transports, bearing the cavalry, were nowhere seen. Cæsar, however, favoured by both wind and tide, proceeded at the appointed hour, and sailing about seven miles further along the coast, prepared to land his forces, on an open, flat shore, which presents itself between Walmer Castle and Sandwich.* The Britons on the cliffs perceiving his design, followed his motions, and sending their cavalry and war-chariots before, marched rapidly on with their main force to oppose his landing anywhere. Cæsar confesses that the opposition of the natives was a bold one, and that the difficulties he had to encounter were very great on many accounts; but superior skill and discipline, and the employment of some military engines on board the war-galleys, to which the British were unaccustomed, and which projected missiles of various kinds, at last triumphed over them, and he disembarked his two legions. We must not omit the act of the standard-bearer of the tenth legion, which has been thought deserving of particular commemoration by his general. While the Roman soldiers were hesitating to leave the ships, chiefly deterred, according to Cæsar's account, by the depth of the water, this officer, having first solemnly besought the Gods that what he was about to do might prove fortunate for the legion, and then exclaiming with a loud voice, "Follow me, my fellow-soldiers, unless you will give up your eagle to the enemy! I, at least, will do my duty to the republic and to our general!" leaped into the sea as he spoke, and dashed with his ensign among the enemy's ranks. The men instantly followed their heroic leader; and the soldiers in the other ships, excited by the example, also crowded forward along with them. The two armies were for some

* Horsley (in Britannia Romana) shows that Cæsar must have proceeded to the north of the South Foreland, in which case the landing must have been effected between Walmer Castle and Sandwich. Others, with less reason, think he sailed southward from the South Foreland, and landed on the flats of Romney Marsh.

time mixed in combat; but at length the Britons withdrew in disorder from the well-contested beach. As their cavalry, however, was not yet arrived, the Romans could not pursue them or advance into the island, which Cæsar says prevented his rendering the victory complete.

The native maritime tribes, thus defeated, sought the advantages of a hollow peace. They despatched ambassadors to Cæsar, offering hostages, and an entire submission. They liberated Comius, and restored him to his employer, throwing the blame of the harsh treatment his envoy had met with upon the multitude or common people, and entreating Cæsar to excuse a fault which proceeded solely from the popular ignorance. The conqueror, after reproaching them for sending of their own accord ambassadors into Gaul to sue for peace, and then making war upon him, *without any reason*, forgave them their offences, and ordered them to send in a certain number of hostages, as security for their good behaviour in future. Some of these hostages were presented immediately, and the Britons promised to deliver the rest, who lived at a distance, in the course of a few days. The native forces then seemed entirely disbanded, and the several chiefs came to Cæsar's camp to offer allegiance, and negotiate or intrigue for their own separate interests.

On the day that this peace was concluded, and not before, the unlucky transports, with the Roman cavalry, were enabled to quit their port on the coast of Gaul. They stood across the channel with a gentle gale; but when they neared the British coast, and were even within view of Cæsar's camp, they were dispersed by a tempest, and were finally obliged to return to the port where they had been so long detained, and whence they had set out that morning. That very night, Cæsar says, it happened to be full moon, when the tides always rise highest—"a fact at that time wholly unknown to the Romans"*—and the galleys which he had with him, and which were hauled up on the beach, were filled with the rising waters, while his heavier transports, that lay at anchor in the roadstead, were either dashed to pieces, or rendered altogether unfit for sailing. This disaster spread a general consternation through the camp; for, as every legionary knew, there were no other vessels to carry back the troops, nor any materials with the army to repair the ships that were disabled, and, as it had been from the beginning, Cæsar's design not to winter in Britain, but in Gaul, he was wholly unprovided with corn and provisions to feed his troops. Suetonius says, that during the nine years Cæsar held the military command in Gaul, amidst a most brilliant series of successes, he experienced only three signal disasters; and he counts the almost entire destruction of his fleet by a storm in Britain, as one of the three.

* The operations of the Roman troops had hitherto been almost confined to the *Mediterranean*, where there is no perceptible tide. Yet, during their stay on the coast of Gaul, on the opposite side of the channel, they ought to have become acquainted with these phenomena. Probably they had never attended to the irregularities of a spring-tide.

Nor were the invaded people slow in perceiving the extent of Cæsar's calamity, and devising means to profit by it. They plainly saw he was in want of cavalry, provisions, and ships; a close inspection showed that his troops were not so numerous as they had fancied, and probably familiarized them in some measure to their warlike weapons and demeanour; and they confidently hoped, that by defeating this force, or surrounding and cutting off their retreat, and starving them, they should prevent all future invasions. The chiefs in the camp having previously held secret consultations among themselves, retired, by degrees, from the Romans, and began to draw the islanders together. Cæsar says, that though he was not fully apprized of their designs, he partly guessed them, from their delay in sending in the hostages promised from a distance, and from other circumstances, and instantly took measures to provide for the worst. He set part of his army to repair his shattered fleet, using the materials of the vessels most injured to patch up the rest; and as the soldiers wrought with an indefatigability suiting the dangerous urgency of the case, he had soon a number of vessels fit for sea. He then sent to Gaul, for other materials wanting, and probably for some provisions also. Another portion of his troops he employed in foraging parties, to bring into the camp what corn they could collect in the adjacent country. This supply could not have been great, for the natives had everywhere gathered in their harvest, except in one field; and there, by lying in ambush, the Britons made a bold and bloody attack, which had well nigh proved fatal to the invaders. As one of the two legions that formed the expedition were cutting down the corn in that field, Cæsar, who was in his fortified camp, suddenly saw a great cloud of dust in that direction. He rushed to the spot with two cohorts, leaving orders for all the other soldiers of the legion to follow as soon as possible. His arrival was very opportune, for he found the legion, which had been surprised in the corn-field, and which had suffered considerable loss, now surrounded and pressed on all sides by the cavalry and war-chariots of the British, who had been concealed in the neighbouring woods. He succeeded in bringing off the engaged legion, with which he withdrew to his intrenched camp, declining a general engagement for the present. Heavy rains that followed for some days, confined the Romans within their intrenchments. Meanwhile the British force of horse and foot was increased from all sides, and they gradually drew round the intrenchments. Cæsar, anticipating their attack, marshalled his legions outside of the camp, and, at the proper moment, fell upon the islanders, who, he says, not being able to sustain the shock, were soon put to flight. In this victory he attaches great importance to a body of thirty horse, which Comius, the Atrebatian, had brought over from Gaul. The Romans pursued the fugitives as far as their strength would permit; they slaughtered many of

them, set fire to some houses and villages, and then returned again to the protection of their camp. On the same day the Britons again sued for peace, and Cæsar being anxious to return to Gaul as quickly as possible, "because the equinox was approaching, and his ships were leaky," granted it to them on no harder condition than that of doubling the number of hostages they had promised after their first defeat. He did not even wait for the hostages, but a fair wind springing up, he set sail at midnight, and arrived safely in Gaul. Eventually only two of the British states sent their hostages; and this breach of treaty gave the Roman commander a ground of complaint by which to justify his second invasion.

In the spring of the following year (B.C. 54) Cæsar again embarked at the same Portus Itius for Britain. This time peculiar attention had been paid to the build and equipment of his fleet: he had 800 vessels of all classes, and these carried five legions and 2000 cavalry,—an invading force in all not short of 32,000 men.* At the approach of this formidable armament the natives retired in dismay from the coast, and Cæsar disembarked, without opposition, at "that part of the island which he had marked out the preceding summer as being the most convenient landing-place." This was probably somewhere on the same flat between Walmer Castle and Sandwich, where he had landed the year before. Having received intelligence as to the direction in which the Britons had retired, he set out about midnight in quest of them, leaving ten cohorts, with 300 horse behind him on the coast, to guard his camp and fleet. After a hurried night-march, he came in sight of the islanders, who were well posted on some rising grounds behind a river,—probably the Stour, near Canterbury. The confederate army gallantly disputed the passage of the river with their cavalry and chariots; but being repulsed by the Roman horse, they retreated towards the woods, to a place strongly fortified both by nature and art, and which Cæsar judged had been strengthened before, on occasion of some internal native war; "for all the avenues were secured by strong barricades of felled trees laid upon one another." This strong-hold is supposed to have been at or near to the spot where the city of Canterbury now stands. Strong as it was, the soldiers of the seventh legion (the force that had suffered so much the preceding campaign in the corn-field) carried it by means of a mound of earth they cast up in front of it; and then they drove the British from the cover of the wood. The evening closed on their retreat, in which they must have suffered little loss, for Cæsar, fearful of following them through a country with which he was unacquainted, strictly forbade all pursuit, and employed his men in fortifying their camp for the night. The Roman eagles were scarcely displayed the following morning, and the trumpets had hardly sounded the advance, when a party of horse brought intelligence from the coast that nearly all the fleet had been driven on shore and wrecked during the night. Commanding a necessary halt, Cæsar flew to the sea-shore, whither he was followed by the legions in full retreat. The misfortune had not been exaggerated: forty of his ships were irretrievably lost, and the rest so damaged that they seemed scarcely capable of repair. With his characteristic activity, he set all the carpenters of the army to work, wrote for more artisans from Gaul, and ordered the legions stationed on that coast to build as many new ships as they could. Apprehensive alike of the storms of the ocean and the fierce attack of the natives, Cæsar ordered that all his ships should be drawn up on dry land and inclosed within his fortified camp. Although the ancient galleys were small and light compared to our modern men-of-war, and the transports and tenders of his fleet in all probability little more than sloops and barges, this was a laborious operation, and occupied the soldiers ten days and nights. Having thus secured his fleet, he set off in pursuit of the enemy, who had made a good use of his absence by increasing their army, and appointing one chief to the supreme command of it. The choice of the confederated states fell upon Cassivellaunus (his Celtic name was perhaps Caswallon), whose territories were divided from the maritime states of the river Thames, at a point which was between seventy and eighty miles from Cæsar's camp on the Kentish coast. This prince had hitherto been engaged in

* In this calculation an allowance of 500 is made for sickness, casualties, and deficiencies. At this period the *infantry* of a legion, when complete, amounted to 6100 men.

ROMAN GALLEY.—Taken from the Model presented to Greenwich Hospital by Lord Anson.*

almost constant wars with his neighbours, whose affection to him must have therefore been of recent date and of somewhat doubtful continuance; but he had a reputation for skill and bravery, and the dread of the Romans made the Britons forget their quarrels for a time, unite themselves under his command, and intrust him with the whole conduct of the war. Cæsar found him well posted at or near to the scene of the last battle. Cassivellaunus did not wait to be attacked, but charged the Roman cavalry with his horse supported by his chariots. Cæsar says that he constantly repelled these charges, and drove the Britons to their woods and hills; but that, after making great slaughter, venturing to continue the pursuit too far, he lost some men. It does not appear that the British retreated far; and some time after these skirmishes they gave the Romans a serious check. Sallying unexpectedly from the wood, they fell upon the soldiers, who were employed as usual in fortifying the camp or station for the night, and cut up the advanced guard. Cæsar sent two cohorts to their aid, but the Britons charged these in separate parties, broke through them, routed them, and then retired without loss. A military tribune was slain,—and but for the timely arrival of some fresh cohorts the conflict would have been very disastrous. Even as it was, and though Cæsar covers the fact by a somewhat confused narrative, it should appear that a good part of his army was beaten on this occasion. He says that from this action, of which the whole Roman army were spectators, it was evident that his heavy-armed legions were not a fit match for the active and light-armed Britons, who

* The construction of Roman galleys has been more completely investigated since Lord Anson's time; but as this model was prepared with great care, and is open to public inspection, we give an engraving of it.

always fought in detachments with a body of reserve in their rear, that advanced fresh supplies when needed, and covered and protected the forces when in retreat; that even his cavalry could not engage without great danger, it being the custom of the Britons to counterfeit a retreat, until they had drawn the Roman horse a considerable way from the legions, when, suddenly leaping from their chariots, they charged them on foot, and, by this *unequal* manner of fighting rendered it equally dangerous to pursue or retire.

The next day the Britons only showed small bodies on the hills at some distance from the Roman camp. This made Cæsar believe they were less willing to skirmish with his cavalry; but no sooner had he sent out *all his cavalry* to forage, supported by *three legions* (between horse and foot this foraging party comprised considerably more than half the forces he had with him), than the Britons fell upon them on all sides, and even charged up to the solid and impenetrable legions. The latter bold step was the cause of their ruin: the superior arms, the defensive armour, and the perfect discipline of those masses, rendered the contest too unequal; the British warriors were repulsed,—thrown off like waves from a mighty rock,—confusion ensued, and, Cæsar's cavalry and infantry charging together, utterly broke the confederate army. The conqueror informs us that after this defeat, the auxiliary troops, which had repaired from all parts to Cassivellaunus's standard, returned severally to their own homes; and that during the rest of the campaign the enemy never again appeared against the Romans with their whole force.

These severe contests had not brought Cæsar far into the interior of the island; but now he followed up Cassivellaunus, who retired, for the defence of his own kingdom, beyond the Thames. Marching through Kent and a part of Surrey, or the beautiful country which now bears those names, the Romans reached the right bank of the Thames, at Coway-stakes, near Chertsey* in Surrey, where the river was considered fordable. The passage, however, was not undisputed: Cassivellaunus had drawn up his troops in great numbers on the opposite bank; he had likewise fortified that bank with sharp stakes, and driven similar stakes into the bed of the river, yet so as to be concealed or covered by the water. Of these things Cæsar says he was informed by prisoners and deserters. It should appear that he overcame the obstacles raised at the ford with great ease; he sent the horse into the

* This point, like most of the other localities mentioned by Cæsar, has been the subject of dispute. We venture to fix it where we do, on the authority of Camden, and Mr. Gale a writer in the Archæologia, vol. i. p. 183.

The Thames at Coway Stakes.

It is stated, upon local tradition, that the passage was made at the bend of the River.

river before, ordering the foot to follow close behind them, which they did with such rapidity that, though nothing but their heads appeared above water, they were presently on the opposite bank, where the enemy could not stand their charge, but fled.

The rest of his army having disbanded, Cassivellaunus now retained no other force than 4000 war-chariots, with which he harassed the Romans, always keeping at a distance from their main body, and retiring, when attacked, to woods and inaccessible places; whither also he caused such of the inhabitants as lay on Cæsar's line of march, to withdraw with their cattle and provisions. Being perfectly acquainted with the country, and all the roads and defiles, he continued to fall upon detached parties; and the Romans were never safe, or masters of any ground, except in the space covered by their entrenched camp or their legions. On account of these frequent surprises, Cæsar would not permit his horse to forage at any distance from the legions, or to pillage and destroy the country, unless where the foot was close at hand to support them.

The fatal want of union among the petty states into which the island was frittered, and the hatred some of them entertained against their former enemy Cassivellaunus, now, however, began to appear and to disconcert all that chief's measures for resistance. The Trinobantes, who dwelt in Essex and Middlesex, and who formed one of the most powerful states in those parts, sent ambassadors to Cæsar. Of this state was Mandubratius, who had fled to Cæsar into Gaul, in order to avoid the fate of his father, Imanuentius, who had held the sovereignty of the state, and whom Cassivellaunus had defeated and put to death. The ambassadors entreated Cæsar to restore their prince, who was then a guest in the Roman camp, to defend him and them against the fury of Cassivellaunus, promising, on these conditions, obedience and entire submission in the name of all the Trinobantes. Cæsar demanded forty hostages, and that they should supply his army with corn. The general does not confess it, but it is very probable that, through the wise measures of Cassivellaunus, the Romans were at this time sorely distressed by want of provisions. The Trinobantes delivered both the corn and the hostages, and Cæsar restored to them their prince. Immediately upon this, other tribes, whom Cæsar designates the Cenimagni, Segontiaci, Ancalites, Bibroci, and Cassi, also sent in their submission. Some of these people informed Cæsar that he was not far from the capital of Cassivellaunus, which was situated amidst woods and marshes, and whither multitudes of the British had retired with their cattle, as to a place of safety. This town is supposed to have been near to the site of St. Alban's, and on the spot where the flourishing Roman colony of Verulamium arose many years after. Though called a town, and a capital, it appears from Cæsar to have been nothing but a thick wood or labyrinth, with clusters of houses or villages scattered about it, the whole being surrounded by a ditch and a rampart, the latter made of mud or felled trees, or probably of both materials mixed. In many respects the towns of the Cingalese in the interior of Ceylon, and the mode of fighting against the English practised by that people, at the beginning of the present century, resemble the British towns and the British warfare of nineteen centuries ago.

Cæsar soon appeared with his legions before the capital of Cassivellaunus; and he says, that though the place seemed very strong both by art and nature, he resolved to attack it in two several points. He was once more successful: the Britons fled to another wood, after a short stand, and the Romans took many prisoners and vast numbers of cattle. Though thus defeated in the inland districts, Cassivellaunus still hoped to redeem the fortunes of his country by a bold and well-conceived blow, to be struck on the sea-coast. While the events related were passing beyond the Thames, he dispatched messengers to the four princes or kings of Cantium (Kent), to instruct them to draw all their forces together, and attack the camp and ships of the Romans by surprise. The Kentish Britons obeyed their instructions, but, according to Cæsar, the Romans, sallying from their entrenchments, made a great slaughter of their troops, took one of the princes prisoner, and returned in safety to the camp. At the news of this reverse, the brave Cassivellaunus lost heart; he sent ambassadors to sue for peace, and availed himself of the mediation with Cæsar of Comius, the king of the Atrebatians, with whom, at one time or other, he appears to have had friendly relations. The Roman general, as we have noticed, states that the authority or influence of Comius in the island was very considerable. It would be curious to see how he exercised it in favour of his Roman patron; but here we are left in the dark. Cæsar turned a ready ear to the overtures of Cassivellaunus, and granted him peace on such easy conditions, that some writers have been induced to believe he was heartily tired of the harassing war. For himself he only says that he was in a hurry to return to Gaul, on account of the frequent insurrections in that country. He merely demanded hostages, appointed a yearly tribute (the amount of which is nowhere named, and which was probably never paid), and charged Cassivellaunus to respect Mandubratius and the Trinobantes. Having received the hostages, he led his troops back to the Kentish coast, and crowding them into his ships as closely and quickly as he could, he set sail by night for Gaul, fearing, he says, the equinoxial storms which were now at hand. He tells us he had many prisoners; but he certainly did not erect a fort, or leave a single cohort behind him, to secure the ground he had gained in the island.*

Tacitus, writing 150 years later, says distinctly, that even Julius Cæsar, the first who entered Britain with an army, although he struck terror into

* For the preceding part of our narrative, see Cæsar de Bello Gallico, from book iv. ch 18, to book v. ch. 19 (inclusive)

Huts in a Cingalese Village.

the islanders by a successful battle could only maintain himself on the sea-coast;—that he was a discoverer rather than a conqueror. He only saw a small portion of the island; but the farther he got from the coast and the Belgic colonies, the more fierce and barbarous he found the natives.

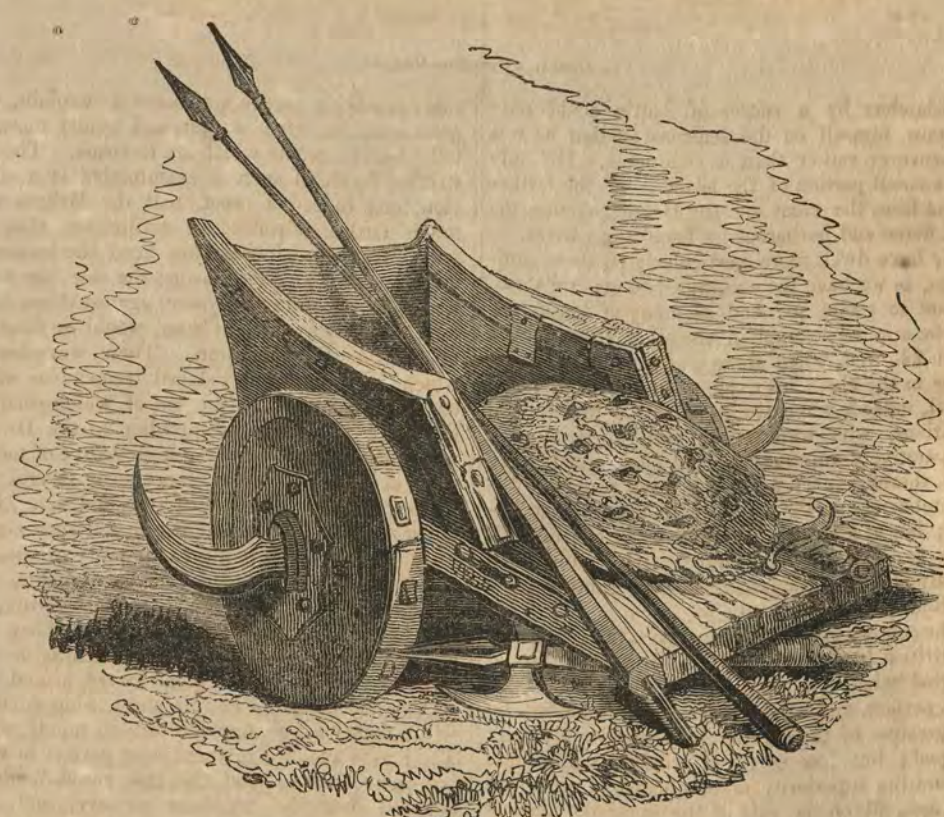
We have dwelt more particularly on these campaigns, as we have the accomplished general's own account to guide us, and as many of his details may be applied to explain the other Roman wars which followed, when there was no Cæsar to describe in the closet his exploits in the field. The sequel, indeed, when we must follow professional historians, who were never even in Britain, is comparatively uninteresting and monotonous. We shall, therefore, set down the great results, without embarrassing the reader with unnecessary details; but at this point it will be well to pause, in order to offer a few general remarks, which will equally elucidate the past and future campaigns of the Romans in our island.

The contest which had thus taken place between the British bands and the famed Roman legions at a period when the discipline of those corps was most perfect, and when they were commanded by the greatest of their generals, was certainly very unequal; but less so (even without taking into account the superiority of numbers and other advantages, all on the side of the invaded,) than is generally imagined and represented. A brief examination of the arts and practices of war of the two contending parties may serve to explain, in a great measure, what is past, and render more intelligible the events which are to ensue. The first striking result of such an examination is a suspicion, and indeed a proof, that the Britons were much farther advanced in civilization than the savage tribes to which it has been the fashion to compare them. Were this not the case, the somewhat unsuccessful employment against them, of so large an army as that of Cæsar, would be disgraceful to the Roman name. Their war-chariots, which several times produced tremendous effects on the Romans, and the use of which seems at that time to have been peculiar to the Britons, would of themselves prove a high degree of mechanical skill, and an acquaintance with several arts. These cars were of various forms and sizes, some being rude, and others of curious and even elegant workmanship. Those most commonly in use, and called *Esseda*, or *Essedæ*, by the Romans, were made to contain each a charioteer for driving, and one, two, or more warriors for fighting. They were at once strong and light; the extremity of their axles and other salient points were armed with scythes and hooks for cutting and tearing whatever fell in their way, as they were driven rapidly along. The horses attached to them were perfect in training, and so well in hand, that they could be driven at speed over the roughest country, and even through the woods, which then abounded in all directions. The Romans were no less astonished

at this dexterity than at the number of the chariots. The way in which the Britons brought the chariots into action, was this: at the beginning of a battle they drove about the flanks of the enemy, throwing darts from the cars; and, according to Cæsar, the very dread of the horses, and the noise of the rapid wheels, often broke the ranks of his legions. When they had succeeded in making an impression, and had winded in among the Roman cavalry, the warriors leaped from the chariots, and fought on foot. In the meantime, the drivers retired with the chariots a little from the combat, taking up such a position as to favour the retreat of the warriors in case of their being overmatched. "In this manner," says Cæsar, "they perform the part both of rapid cavalry and of steady infantry; and, by constant exercise and use, they have arrived at such expertness, that they can stop their horses when at full speed, in the most steep and difficult places, turn them which way they please, run along the carriage-pole, rest on the harness, and throw themselves back into their chariots with incredible dexterity."

For a long time the veteran legions of Rome could not look on the clouds of dust that announced the approach of these war-chariots without trepidation. The Gauls had once the same mode of fighting, and equally distressed the Romans with their war-chariots. Nearly 300 years before the invasion of Britain, when the Gauls were established in parts of Italy, and in close alliance with the Samnites, a successful charge of the Roman cavalry was repulsed, and the whole army thrown into dismay, by a mode of fighting to which they were utter strangers: "A number of the enemy," says Livy, "mounted on chariots and cars, made towards them with such a terrible noise, from the trampling of the horses and the rolling of the wheels, as affrighted the horses of the Romans, unaccustomed to such operations. By this means, the victorious cavalry were dispersed, and men and horses, in their headlong flight, were thrown in heaps to the ground. The same cause produced disorder even in the ranks of the legions: through the impetuosity of the horses, and the carriages they dragged through the ranks, many of the Roman soldiers in the van were trodden or bruised to death; and the Gauls, as soon as they saw the enemy in confusion, followed up the advantage, nor allowed them breathing-time." * The use of war-chariots, however, seems to have fallen out of fashion among the Gauls, during the long period that had

* Tit. Liv., l. x. c. 28.



BRITISH WAR CHARIOT, SHIELD, AND SPEARS.—De Loutherbourg.

intervened; for Cæsar never makes mention of them, in describing his many battles with that people on the continent.

The existence of the accessories—the hooks and scythes attached to the wheels or axles—has been questioned, as neither Cæsar, nor Tacitus, nor any early writer, with the exception of the geographer Pomponius Mela (who wrote, however, in the first century), expressly mentions them in describing the war-chariots. Weapons, answering to the description, have, however, been found, on the field of some of the most ancient battles. Between the Roman invasion under Cæsar, and that ordered by the Emperor Claudius, the cars or chariots of the British attracted notice, and were exhibited in Italy. They were seen in the splendid pageantry with which Caligula passed over the sea from Puteoli to Baiæ, on his mole and bridge of boats. The emperor, Suetonius tells us, rode in a chariot drawn by two famous horses, and a party of his friends followed, mounted in British chariots. Probably Cæsar had carried some of the native war-cars to Rome, as curiosities, just as our navigators bring the canoes of the Indians and South-Sea Islanders to England. At subsequent periods, the war-chariots of the Britons were frequently alluded to by the poets as well as historians of Rome.

The ancient Britons were well provided with horses, of a small breed, but hardy, spirited, and yet docile. Their cavalry were armed with shields, broad-swords, and lances. They were accustomed, like the Gauls, and their own chariot-men, to dismount, at fitting seasons, and fight on foot; and their horses are said to have been so well trained, as to stand firm at the places where they were left, till their masters returned to them. Another common practice among them was, to mix an equal number of their swiftest foot with their cavalry, each of these foot-soldiers holding by a horse's mane, and keeping pace with him in all his motions. Some remains of this last custom were observed among the Highland clans in the last century, in the civil wars for the Pretender; and in more modern, and regular, and scientific warfare, an advantage has often been found in mounting infantry behind cavalry, and in teaching cavalry to dismount, and do the duty of foot-soldiers. A great fondness for horses, and a skill in riding them, and breaking them in for cars and chariots, were observable in all the nations of the Celtic race. The scythe-armed cars of the Britons may be assumed as one of the many links in that chain which seems to connect them with Persia and the East, where similar vehicles were in use for many ages.

The infantry of the Britons was the most numerous body, and, according to Tacitus, the main strength of their armies. They were very swift of foot, and expert in swimming over rivers and crossing fens and marshes, by which means they were enabled to make sudden attacks and safe retreats. They were slightly clad; throwing off in battle the whole, or at least the greater part, of whatever clothing they usually wore, according to a custom which appears to have been common to all the Celtic nations. They were not encumbered with defensive armour, carrying nothing of that sort but a small light shield; and this, added to their swiftness, gave them, in some respects, a great advantage over the heavily-armed Romans, whose foot could never keep pace with them. This, indeed, was so much the case in the ensuing wars, that the turn of a battle was often left to depend, not on the legions, but on their barbarian auxiliaries, some of whom were as lightly equipped as the Britons themselves. In coming to their offensive arms, we reach a point where they were decidedly inferior to the Romans; and a cause, perhaps, as principal as any other, of their invariable defeat when they came to close combat. Their swords were long and unwieldy, without points, and only meant for cutting—awkward and offenceless weapons compared to the compact, manageable, cut-and-thrust swords of their enemies, which could be used in the closed *mêlée*. But an important circumstance, which throws the advantage still more on the side of the Romans, is, that while their weapons were made of well-tempered steel, the swords and dirks of the Britons were, in all probability, only made of copper, or of copper mixed with a little tin. We are told that the swords of their neighbours, the Gauls, were made of copper, and bent after the first blow, which gave the Romans a great advantage over them.

A prodigious number of warlike implements, as axes, swords, spear-heads, all made of copper, or of copper mixed with tin, and known among antiquaries by the general name of "Celts," have been dug up in different parts of our island; but we are not aware of the discovery of any things of the sort made of iron, that can safely be referred to the manufacture of the ancient Britons. In the absence of metals, they used bones and flints to tip their arrows, their spears, and lances. Heavy black stones, perforated to receive a wooden handle, served them as maces or battle-axes. These are the very weapons of savages; and perhaps those which have been found in such abundance buried in the earth, are much more ancient than the period of Cæsar's invasion, or were only used at that and later periods in the interior and northern parts of the country.

In addition to their clumsy sword, the British infantry carried a short dirk and a spear. The spear was sometimes used as a missile weapon, having a leather thong fixed to it, and retained in the hand when thrown, in order that it might be recovered again: at the butt-end of this spear was sometimes a round hollow ball of copper, or mixed copper and tin, with pieces of metal inside, and, shaking this, they made a noise to frighten the horses when they engaged with cavalry.

With the exception of the Druids, all the young men among the Britons and other Celtic nations were trained to the use of arms. Frequent hostilities among themselves kept them in practice, and

hunting and martial sports were among their principal occupations in their brief periods of peace. Even in tactics and stratagetics, the more difficult parts of war, they displayed very considerable talent and skill. They drew up their troops in regular order; and if the form of a wedge was not the very best for infantry, it has been found, by the Turks and other Eastern nations, most effective for cavalry appointed to charge. They knew the importance of keeping a body in reserve; and in several of their battles they showed skill and promptitude in out-flanking the enemy, and turning him by the wings. Their infantry generally occupied the centre, being disposed in several lines, and in distinct bodies. These corps consisted of the warriors of one clan, commanded each by its own chieftain; they were commonly formed in the shape of a wedge, presenting its sharp point to the enemy; and they were so disposed, that they could readily support and relieve each other. The cavalry and chariots were placed on the wings, but small flying parties of both manœuvred along the front. In the rear and on their flanks they fixed their travelling chariots and their waggons, with their respective families in them, in order that those vehicles might serve as barriers to prevent attack in those directions, and that their courage might be inflamed by the presence of all who were most dear to them.

Some of the native princes displayed eminent abilities in the conduct of war. According to the Roman writers, Cassivellaunus, Caractacus, and Galgacus all formed combined movements and enlarged plans of operation, and contrived stratagems and surprises which would have done honour to the greatest captains of Greece and Rome. Their choice of ground for fighting upon was almost invariably judicious, and they availed themselves of their superior knowledge of the country on all occasions. In the laborious arts of fortifying, defending, or attacking camps, castles, and towns, they were, however, deficient. Their strongest places were surrounded only by a shallow ditch and a mud wall, while some of their towns had nothing but a parapet of felled trees placed lengthwise. While the Roman camps, though occupied only for a night, were strongly fortified, their own camps were merely surrounded by their cars and waggons,—a mode of defence still common among the Tartar and other nomadic tribes in Asia. But, as the Roman war proceeded, we frequently find them giving more attention to the defence of their night camps; and some of the more permanent positions they took up were strengthened with deep ditches and stone walls.

The armies of the ancient Britons were not divided into bodies, mixed, but distinct as a whole, consisting each of a determinate number of men recruited from different families and in different places, and commanded by appointed officers of various ranks, like the Roman legions and our modern regiments; but all the fighting-men of each particular clan or great family formed a separate band, commanded by the chieftain or head of that family. By this system, which had other disadvantages, the command was frittered away into minute fractions. All the several clans which composed one state or kingdom were commanded in chief by the sovereign of that state; and when two or more states formed an alliance and made war in conjunction, the king of one of these states was chosen to be generalissimo of the whole. These elections gave rise to jealousies and dissensions, and all through the system there were too many divisions of command and power, and too great a disposition in the warriors to look up only to the head of their own clan, or at furthest to the king of their own limited state.

Far different from these were the thoroughly organized and inter-dependent masses of the Roman army, where the commands were nicely defined and graduated, and the legions (each a small but perfect army in itself) acted at the voice of the consul, or its one supreme chief, like a complicated engine set in motion by its main-wheel. As long as Rome maintained her military glory, the legions were composed only of free Roman citizens, no allies or subjects of conquered nations being deemed worthy of the honour of fighting in their ranks. Each legion was divided into horse and foot, the cavalry bearing what is considered, by modern scientific writers, a just proportion, and not more, to the infantry. Under the old kings a legion consisted of 3000 foot, and 300 horse; under the consuls, of 4200 foot, and 400 horse; but under Cæsar and the emperors it amounted to 6100 foot, and 726 horse. Like our regiments, the legions were distinguished from each other by their number; being called the first, the second, the third, &c. In the early ages of the republic they had no more than four or five legions kept on foot, but these were increased with increase of conquest and territory, and under the empire they had as many as twenty-five or thirty legions, even in time of peace. The infantry of each legion was divided into ten cohorts. The first cohort, which had the custody of the eagle and the post of honour, was 1105 strong; the remaining nine cohorts had 555 men each.

Instead of a long, awkward sword of copper, every soldier had a short, manageable, well tempered Spanish blade of steel, sharp at both edges as at the point; and he was always instructed to thrust rather than cut, in order to inflict the more fatal wounds, and expose his own body the less. In addition to a lighter spear, the legionary carried the formidable *pilum*, a heavy javelin six feet long, terminating in a strong triangular point of steel, eighteen inches long. For defensive armour they wore an open helmet with a lofty crest, a breast-plate or coat of mail, greaves on their legs, and a large, strong shield on their left arms. This shield or buckler, altogether unlike the small, round, basket-looking thing used by the Britons, was four feet high, and two and a half broad; it was framed of a light but firm wood, covered with

Roman General, accompanied by Standard Bearers and common Legionaries, landing from a Bridge of Boats.

bull's hide, and strongly guarded with bosses or plates of iron or bronze.

The cavalry of a legion was divided into ten troops or squadrons; the first squadron, as destined to act with the strong first cohort, consisting of 132 men, whilst the nine remaining squadrons had only 66 men each. Their principal weapons were a sabre and a javelin; but at a later period they borrowed the use of the lance and iron mace or hammer from foreigners. For defensive armour they had a helmet, a coat of mail, and an oblong shield. The legions serving abroad were generally attended by auxiliaries raised among the provinces and conquests of the empire, who for the most part retained their national arms and loose modes of fighting, and did all the duties of light troops. Their number varied according to circumstances, being seldom much inferior to that of the legions; but in Britain, where mention of the barbarian auxiliaries constantly occurs, and where, as we have intimated, they performed services for which the legions were not calculated, they seem to have been at least as numerous as the Roman soldiers. Three legions, say the historians, were competent to the occupation of Britain; but to this force of 20,478 we must add the auxiliaries, which will swell the number to 40,956. Gauls, Belgians, Batavians, and Germans were the hordes that accompanied the legions in our island.

Such were the main features and appointments of the Roman legions in their prime, and such they continued during their conflict with the Britons, and long after all the southern parts of our island were subjugated by their might. They were afterwards sadly diminished in numbers and in consideration. They lost their discipline; the men threw off their defensive armour as too heavy for them to wear; changes were made in their weapons; and, not to notice many intermediate variations, a legion, at the final departure of the Romans from Britain, consisted only of from 2500 to 3000 indifferently armed men.

After the departure of Cæsar, Britain was left undisturbed by foreign arms for nearly one hundred years. But few of the events that happened during that long interval have been transmitted to us. We can, however, make out in that dim obscurity that the country, and more particularly those maritime parts of it occupied by the Belgæ, and facing the coast of Gaul, made considerable advances in civilization, borrowing from the Gauls, with whom they were in close communication, some of those useful and elegant arts which that people had learned from the Roman conquerors,

CHARGE OF ROMAN INFANTRY.—From the Column of Trajan.

now peaceably settled among them. Besides their journeys into Gaul, which are well proved, it is supposed that during this long interval not a few of the superior class of Britons, from time to time, crossed the Alps, and found their way to Rome, where the civilization and arts of the world then centred.

This progress, whatever it was, does not appear to have been accompanied by any improvement in the political system of the country, or by any union and amalgamation of the disjointed parts or states. Internal wars continued to be waged; and this disunion of the Britons, their constant civil dissensions, and the absence of any steady system of defence, laid them open to the Romans whenever those conquerors should think fit to revisit their fair island and renew the struggle in earnest.

That time at length arrived. In the ninety-seventh year after Cæsar's second expedition (A.D. 43), the Emperor Claudius* resolved to seize the island, and Aulus Plautius, a skilful commander, landed with four complete legions, which, with the cavalry and auxiliaries, must have made above 50,000 men. The Britons, who had made no preparations, at first offered no resistance; and when they took the field under Caractacus and Togodumnus, sons of the deceased Cunobelinus, who is supposed to have been king of the Trinobantes, they were thoroughly defeated in the inland country by the Romans. Some states or tribes, detaching themselves from the confederacy, then submitted; and Aulus Plautius, leaving a garrison in those parts which included Gloucestershire and portions of the contiguous counties, followed up his victories beyond the river Severn, and made considerable progress in subduing the inhabitants. After sustaining a great defeat on the right bank of the Severn, the Britons retreated eastward to some marshes on the Thames, where, availing themselves of the nature of the ground, they made a desperate stand, and caused the Romans great loss. In these campaigns Plautius made great use of his light-armed barbarian auxiliaries (chiefly Germans), many of whom, on this particular occasion, were lost in the deep bogs and swamps. Though Togodumnus was slain, it does not appear that the natives were defeated in this battle; and Plautius, seeing their determined spirit, withdrew his army to the south of the Thames to await the arrival of the Emperor Claudius, whose presence and fresh forces he earnestly solicited. Claudius embarked with reinforcements

* Pomponius Mela, who wrote in the time of Claudius, expresses a hope that the success of the Roman arms will soon make the island and its savage inhabitants better known.

at Ostia at the mouth of the Tyber, landed at Massilia (Marseilles), and proceeded through Gaul to Britain. It is said that some elephants were included in the force he brought, but we hear nothing of those animals after his arrival in the island. There is some confusion as to the immediate effect of the Emperor's arrival, the two brief historians* of the events contradicting each other; but we believe that, without fighting any battles, the pusillanimous Claudius accompanied his army on its fresh advance to the north of the Thames, was present at the taking of Camalodunum, the capital of the Trinobantes, and that then he received the proffered submission of some of the states, and returned to enjoy an easily-earned triumph at Rome, whence he had been absent altogether somewhat less than six months.

Claudius.

While Vespasian, his second in command, who was afterwards emperor under the same name, employed himself in subduing Vectis (the Isle of Wight) and the maritime states on the southern and eastern coasts, Aulus Plautius prosecuted a long and, in good part, an undecisive warfare with the inland Britons, who were still commanded by Caractacus. Between them both, Plautius and Vespasian thoroughly reduced no more of the island than what lies to the south of the Thames, with a narrow strip on the left bank of that river; and when Plautius was recalled to Rome, even these territories were over-run and thrown into confusion by the Britons. Ostorius Scapula, the new prætor, on his arrival in the island (A.D. 50), found the affairs of the Romans in an all but hopeless state; their allies, attacked and plundered on all sides, were falling from them, the boldness of the unsubdued states was rapidly increasing, and the people they held in subjection were ripe for revolt. But Ostorius, who had probably brought reinforcements into the island, was equal to this emergency: knowing how much depends on the beginning of a campaign, he put himself at the head of the light troops, and advanced against the marauding enemy by rapid marches. The Britons, who did not expect he would open a campaign in the winter, were taken by surprise, and defeated with great loss. It should appear from Tacitus that Ostorius at once recovered all the country, as far as the Severn, that had been conquered, or rather temporarily occupied, by his predecessor Plautius; for the great historian tells us, immediately after, that he erected a line of forts on the Sabrina (Severn) and the Antona (Nene); but it is more probable that this advance was made by a series of battles, rather than by one hasty blow struck in the winter by the light division of his army. Ostorius was the first to cover and protect the conquered territory by forts and lines; the line he now drew cut off from the rest of the island nearly all the southern and south-eastern parts, which included the more civilized states who had either submitted or become willing allies, or been conquered by Plautius and Vespasian. It was by the gradual advance of lines like these that the Romans brought the whole of England south of the Tyne, under subjection. Ostorius, also, adopted the cautious policy of disarming all such of the Britons within the line of forts as he suspected. This measure, always odious, and never to be carried into effect without shameful abuses of power, particularly exasperated those Britons within the line, who, like the Iceni, had not been conquered, but, of their own good and free will, had become the allies of the Romans. Enemies could not treat them worse than such friends,—the surrender of arms was the worst consequence that could result from defeat in a war which they had not yet essayed. It would also naturally occur to them that if the Romans were permitted to coop them up within military posts, and sever them from the rest of the island, their independence, whether unarmed or armed, was completely sacrificed.

The Iceni, a brave tribe, who are supposed to have dwelt in Norfolk and Suffolk, took up arms, formed a league with their neighbours, and chose their ground for a decisive battle. They were beaten by Ostorius, after having fought obstinately

* Dio Cass. (in the abridgment by Xiphilinus), lib. lx. Suetonius in C. Claud. c. xvii.

to the last and given signal proofs of courage. After the defeat of the Iceni and their allies, the Romans marched beyond their line of demarcation against a people called the Cangi, and, Tacitus says, got within a short march of that sea that lies between Britain and Ireland. From the pursuit of this timid enemy, Ostorius was recalled by a rising of the Brigantes, who occupied Yorkshire, with parts of Lancashire and the adjoining counties. Having subdued these in their turn, and drawn a camp and fixed a colony of veterans among them, Ostorius marched rapidly against the Silures,—the inhabitants of South Wales,—the fiercest and most obstinate enemies the Romans ever encountered in South Britain. To their natural ferocity, says Tacitus, these people added the courage which they now derived from the presence of Caractacus. His valour, and the various turns of his fortune, had spread the fame of this heroic chief throughout the island. His knowledge of the country, his admirable skill in the stratagems of war, were great advantages; but he could not hope, with inferior forces, to beat a well-disciplined Roman army. He therefore retired to the territory of the Ordovices, which seems to have included within it nearly all North Wales. Having drawn thither to his standard all who considered peace with the Romans as another word for slavery, he resolved to wait firmly the issue of a battle. According to the great historian, he chose his field with admirable art. It was rendered safe by steep and craggy hills. In parts where the mountains opened and the easy acclivity afforded an ascent, he raised a rampart of massy stones. A river which offered no safe ford flowed between him and the enemy, and a part of his forces showed themselves in front of his ramparts.

As the Romans approached, the chieftains of the confederated British clans rushed along the ranks exhorting their men, and Caractacus animated the whole, exclaiming,—"This day must decide the fate of Britain. The era of liberty or eternal bondage begins from this hour! Remember your brave ancestors who drove the great Cæsar himself from these shores, and preserved their freedom, their property, and the persons and honour of their wives and children!" There is a lofty hill in Shropshire, near to the confluence of the rivers Colu and Teme, which is generally believed to be the scene of the hero's last action. Its ridges are furrowed by trenches and still retain fragments of a loose stone rampart, and the hill for many centuries has been called by the people Caer-Caradoc, or the castle or fortified place of Caradoc, supposed to be the British name of Caractacus. Ostorius was astonished at the excellent arrangement and spirit he saw, but his numbers, discipline, and superior arms once more gained him a victory. Tacitus says that the Britons, having neither breast-plates nor helmets, could not maintain the conflict,—that the better Roman swords and spears made dreadful havoc,—that the victory was complete. Caractacus escaped from the carnage; but his wife and daughter were taken prisoners, and his brothers surrendered

BRITISH CAMP AT CAER-CARADOC.—From Roy's Military Antiquities.

soon after the battle. The hero himself did not, however, escape long, for having taken refuge with his stepmother, Cartismandua, queen of the Brigantes, that heartless woman caused him to be put in chains, and delivered up to the Romans. From the camp of Ostorius he was carried, with his wife and all his family, to the foot of the Emperor's throne. All Rome—all Italy—were impatient to gaze on the indomitable Briton, who for nine years had bidden defiance to the masters of the world. His name was everywhere known, and he was everywhere received with marked respect. In the presence of Claudius, his friends and family quailed and begged for mercy; he alone was superior to misfortune: his speech was manly without being insolent,—his countenance still unaltered, not a symptom of fear appearing—no sorrow, no mean condescension; he was great and dignified even in ruin. This magnanimous behaviour no doubt contributed to procure him milder treatment than the Roman conquerors usually bestowed on captive princes; his chains and those of his family were instantly struck off. At this crisis Tacitus leaves him, and his subsequent history is altogether unknown.

Caractacus at Rome.—Fuseli.

Their sanguinary defeat and the loss of Caractacus did not break the spirit of the Silures. They fell upon the Romans soon after, broke up their fortified camp, and prevented them from erecting a line of forts across their country. The prefect of the camp, with eight centurions and the bravest of his soldiers, was slain; and, but for the arrival of reinforcements, the whole detachment would have been sacrificed. A foraging-party, and the strong detachments sent to its support, were routed; this forced Ostorius to bring his legions into action, but, even with his whole force, his success was doubtful and the loss of the Silures very inconsiderable. Continual and most harassing attacks and surprises followed, till at length Ostorius, the victor of Caractacus, sunk under the fatigue and vexation, and expired, to the joy of the Britons, who boasted that though he had not fallen in battle, it was still their war which had brought him to the grave. The country of the Silures, intersected by numerous and rapid rivers, heaped into mountains, with winding and narrow defiles, and covered with forests, became the grave of many other Romans; and it was not till the reign of Vespasian, and more than twenty years after the death of Ostorius, that it was conquered by Julius Frontinus.

For some time the Roman power in Britain was stationary, or, at most, it made very little progress under Aulus Didius and Veranius, the immediate successors of Ostorius. Indeed, under these governors, the Emperor Nero, who had succeeded his father Claudius, is said to have seriously entertained the thought of withdrawing the troops and abandoning the island altogether,—so profitless and uncertain seemed the Roman possession of Britain.

But the next governor, Paulinus Suetonius, an officer of distinguished merit (A.D. 59—61), revived the spirit of the conquerors. Being well aware that the island of Mona, now Anglesey, was the chief seat of the Druids, the refuge place of the defeated British warriors and of the disaffected generally, he resolved to subdue it. In order to facilitate his approach, he ordered the construction of a number of flat-bottomed boats; in these he transported his infantry over the strait which divides the island from the main (the Menai), while the cavalry were to find their way across, partly by fording and partly by swimming. The Britons added the terrors of their superstition to the force of their arms for the defence of this sacred island. "On the opposite shore," says Tacitus, "there stood a wildly-diversified host: there were armed men in dense array, and women running among them, who, in dismal dresses and with dishevelled hair, like furies, carried flaming torches. Around were Druids, pouring forth curses, lifting up their hands to heaven, and striking terror, by the novelty of their appearance, into the hearts of the Roman soldiers, who, as if their limbs were paralyzed, exposed themselves motionless to the blows of the enemy. At last, aroused by the exhortations of their leader, and stimulating one another to despise a frantic band of women and priests, they make their onset, overthrow their foes, and burn them in the fires which they themselves had kindled for others. A garrison was afterwards placed there among the conquered, and the groves sacred to their cruel superstition, were cut down."

But while Suetonius was engaged in securing the sacred island, events took place in his rear which went far to commit the safety of the entire empire of the Romans in Britain. His attack on the Druids and the grove of Mona could not fail to exasperate all the British tribes that clung to their ancient worship; other and recent causes of provocation were particular to certain of the states. The Romans, in the colonies they had planted in the island, indulged too freely in what are called the rights of conquest: they treated the Britons with cruelty and oppression; they drove them from their houses, and adding insult to wrong, called them by the opprobrious names of slaves and captives. In these acts the veterans or superiors were actively seconded by the common soldiery,—a class of men who, in the words of Tacitus, are by their habits of life trained to licentiousness. The conquerors, too, had introduced priests of their own creed; and these, "with a pretended zeal for religion, devoured the substance of the land." Boadicea, widow of king Prasutagus, and now queen of the Iceni, probably because she remonstrated against the forcible seizure of the territory her husband bequeathed her, or possibly because she attempted to resist the Romans in their plunder, was treated with the utmost barbarity: Catus, the procurator, caused her to be scourged, her daughters to be violated in her presence, and the relations of her deceased husband to be reduced to slavery. Her unheard-of wrongs, the dignity of her birth, the energy of her character, made Boadicea the proper rallying point; and immediately an extensive armed league entrusted her with the supreme command. Boadicea's own subjects were joined by the Trinobantes; and the neighbouring states, not as yet broken into a slavish submission, engaged in secret councils to stand forward in the cause of national liberty. They were all encouraged by the absence of Suetonius, and thought it no difficult enterprise to overrun a colony undefended by a single fortification. Tacitus says (and the statement is curious, considering their recent and uncertain tenure) that the Roman governors had attended to improvements of taste and elegance, but neglected the useful,—that they had embellished the province, but taken no pains to put it in a state of defence. The storm first burst on the colony of Camalodunum, which was laid waste with fire and sword, a legion which marched to its relief being cut to pieces. Catus, the procurator, terrified at the fury his own enormities had mainly excited, fled, and effected his escape into Gaul On receiving the news of these disasters, Suetonius hurried across the Menai strait, and marching through the heart of the country came to London, which city, though not yet dignified with the name of a Roman colony, was a populous, trading, and prosperous place. He soon found he could not maintain that important town, and therefore determined to evacuate it, in order to secure the rest of the provinces. The inhabitants, who foresaw the fate of the fair town, implored him with tears to change his plan, but in vain. The signal for the march was given, the legions defiled through the gates, but all the citizens who chose to follow their eagles were taken under their protection. They had scarcely cleared out from London when the Britons entered: of all those who from age, or weakness, or the attractions of the spot, had thought proper to remain behind, scarcely one escaped. The inhabitants of Verulamium were in like manner utterly annihilated, and, the carnage still spreading, no fewer than 70,000 Romans and their confederates fell in the course of a few days. The infuriated insurgents made no prisoners, gave no quarter, but employed the gibbet, the fire, and the cross, without distinction of age or sex.

Suetonius, having received reinforcements which made his army amount to about 10,000 men, all highly disciplined, chose an advantageous field, and waited the battle. The Britons were also reinforced, and from all quarters: Tacitus says they were an incredible multitude; but their ranks were swelled and weakened by women and children.

Boadicea haranguing the British Tribes.—Stothard.

They were the assailants, and attacked the Romans in the front of their strong position.

Previously to the first charge, Boadicea, mounted in a war-chariot, with her long yellow hair streaming to her feet, with her two injured daughters beside her, drove through the ranks, and harangued the tribes or nations, each in its turn.* She reminded them that she was not the first woman that had led the Britons to battle; she spoke of her own irreparable wrongs, of the wrongs of her people and all their neighbours; and said whatever was most calculated to spirit them against their proud and licentious oppressors. The Britons, however, were defeated with tremendous loss; and the wretched Boadicea put an end to her existence by taking poison. As if not to be behind the barbarity of those they emphatically styled barbarians, the Romans committed an indiscriminate massacre, visiting with fire and sword not only the lands of those who had joined the revolt, but of those who were thought to have wavered in their allegiance. Tacitus estimates the number of the Britons who were thus destroyed at 80,000; and in the train of war and devastation followed famine and disease.

* Dio has described her costume as being a plaited tunic of various colours, a chain of gold round her waist, and a long mantle over all. *Dio Nic. apud Xiphil.*

But the despondence of sickness and the pangs of hunger could not induce them to submit; and though Suetonius received important reinforcements from the continent (acording to Tacitus, by the directions of the emperor Nero, 2000 legionary soldiers, 8 auxiliary cohorts, and 1000 horse, were sent to him from Germany), and retained the command some time longer, he left the island without finishing this war; and notwithstanding his victories over the Druids and Boadicea, his immediate successors were obliged to relapse into inactivity, or merely to stand on the defensive, without attempting the extension of their dominions.

Some fifteen or sixteen years after the departure of Suetonius the Romans recommenced their forward movements, and (A.D. 75—78) Julius Frontinus at last subdued the Silures. This general was succeeded by Cnæus Julius Agricola, who was fortunate, as far as his fame is regarded, in having for his son-in-law the great Tacitus, the partial and eloquent recorder of his deeds. Exaggeration and favour apart, however, Agricola appears to have had a skill in the arts both of peace and war. He had served under Suetonius during the Boadicean war; he was beloved by his army, and well acquainted with the country; and now, before he left the supreme command, he completed the conquest

of South Britain, and showed the victorious eagles of Rome as far north as the Grampian hills. One of his first operations, which proves with what tenacity the British held to their own, was the reconquest of Mona; for scarcely had Suetonius turned his back when they repossessed themselves of that island. Having made this successful beginning, and also chastised the Ordovices, who had cut a division of cavalry to pieces, he endeavoured by mild measures to endear himself to the acknowledged provincials of Rome, and to conciliate the British tribes generally, by acts of kindness. "For," says Tacitus," the Britons willingly supply our armies with recruits, pay their taxes without a murmur, and they perform all the services of government with alacrity, provided they have no reason to complain of oppression. When injured, their resentment is quick, sudden, and impatient: they are conquered, not spirit-broken; they may be reduced to obedience, not to slavery."*

At the same time Agricola endeavoured to subdue their fierceness and change their erratic habits, by teaching them some of the useful arts, and accustoming them to some of the luxuries of civilized life. He persuaded them to settle in towns, to build comfortable dwelling-houses, to raise halls and temples. It was a capital part of his policy to establish a system of education, and give to the sons of the leading British chiefs a tincture of polite letters. He praised the talents of the pupils, and already saw them, by the force of their natural genius, outstripping the Gauls, who were distinguished for their aptitude and abilities. Thus, by degrees, the Britons began to cultivate the beauties of the Roman language, which they had before disdained, to wear the Roman toga as a fashionable part of dress, and to indulge in the luxuries of baths, porticos, and elegant banquets.

In the second year of his government (A.D. 79), Agricola advanced into the north-western parts of Britain, and partly by force and more by clemency, brought several tribes to submission. These are not named by Tacitus, but they probably dwelt in the heart of the country to the east of the Ordovices and the Silures. Wherever he gained a district he erected fortifications composed of castles and ramparts.

In his third campaign (A.D. 80) Agricola led his army still further north; but the line of march, and the degree of progress made in it, are not easily ascertained. The outlines presented to us by Tacitus are vague and indistinct, which may be ascribed both to the generality of that writer's language, and to the limits of his information.

It is the opinion of a late writer,* however, that Agricola, setting out from Mancunium, the Manchester of present times, led his army towards the north-western coasts, and not towards the north-eastern, as is commonly stated; and that after traversing parts of Lancashire, Westmoreland, and Cumberland, he came to the *Tau*, which this writer contends was not the river Tay, but the Solway Frith. The *Tau*, he says (the Taus of Tacitus) was a British word, signifying an estuary, or any extending water; it might equally imply the Solway, the Tay, or any other estuary. Besides, it was the plan of this cautious general, it is argued, to advance, by degrees, and fortify the country as he advanced; and we accordingly find him spending the remainder of this season in building a line of forts, in the most convenient situations for keeping possession of the territory he had gained. The raising of a part, if not of the whole of that rampart drawn right across the island, from the Solway to near the mouth of the Tyne, and called Agricola's Wall, is supposed to have taken place in this year. It must be confessed, however, that the tenor of Tacitus's narrative, and some of his expressions in particular, require considerable straining before we can reconcile them with this account. In the first place, it is to be observed, that he speaks of Agricola's march to the Taus in his third summer, as merely an inroad, the effects of which were to discover the country, to lay it waste, and to strike terror into the inhabitants. It appears to be clear that the occupation of it was not at that time attempted or thought of. Then, when the historian proceeds to relate the operations of the next campaign, he expressly informs us that the country which Agricola employed this fourth summer in taking possession of and fortifying, was that which he had thus in the preceding summer overrun. No words are used which can imply that he penetrated into any new country in his fourth compaign; the statement distinctly is, that he only occupied and secured what he had already surveyed and laid waste.

According to the view, however, which supposes him not till now to have ever been beyond the Solway, his fourth summer (A.D. 81) was employed in exploring and overrunning the country extending from that arm of the sea to the Friths of Clyde and Forth, and in securing, as usual, the advance he had thus made. Tacitus describes the place where the waters of the Glotta and Bodotria (the Friths of Clyde and Forth) are prevented from joining only by a narrow neck of land, and tells us, that Agricola drew a chain of forts across that isthmus. These forts are supposed to have stood in the same line where Lollius Urbicus afterwards erected his more compact rampart, and not far from the modern canal which connects the two estuaries.

But in making this advance, Agricola seems to have neglected the great promontory of Galloway, which lay between the Solway and the Clyde, and was then occupied by the Novantæ, and, in part, by the Selgovæ and Damnii; we mean more particularly the country now included in Wigton, Kirkcudbright, Dumfries, and Ayrshire. In his fifth campaign (A.D. 82), therefore, he thought it prudent to subdue these tribes, who, in the advance he contemplated for the next year beyond the Frith of Forth, would, from their western position, have been in his rear. He accordingly invaded "that part of Britain," says Tacitus, "which is opposite

* Chalmers, Caledonia.

to Ireland," being the whole extent of Galloway; and, to do this, he is supposed to have sailed from Kilbride Loch, in Cumberland and on the Solway, and to have landed on the estuary of Locher. * From the Galloway coast he saw the distant hills of Ireland; and the sight is said to have suggested the idea of a fresh invasion, to which, moreover, he was incited by an Irish chieftain, who, being expelled from his native country, had taken refuge with the Roman commander. Having, after various engagements, cleared the south-west of Scotland as far as his fortified works on the Frith of Clyde, he seems to have put the mass of his army into winter quarters along the line he had drawn from that estuary to the Frith of Forth, so as to have them ready for next year's campaign.

In his sixth year (A.D. 83), Agricola resolved to extend his conquests to the north-east, beyond the Frith of Forth. His fleet had already surveyed the coasts and harbours, and his naval officers showed him the most commodious passage,—at Inchgarvey, as it is supposed,—where he seems to have been met by a part of his fleet, and wafted over to the advancing point in Fife, now called Northferry. † Other writers, however, suppose that he marched along the southern side of the Forth, to a point where the river was narrow and fordable, and crossed it somewhere near Stirling. It is possible that both courses may have been adopted by different divisions of the troops. On the north side of the Forth the troops were attended and supported by the ships; so that their march must have been along the east-coast. The fleet kept so near the shore, that the mariners frequently landed and encamped with the land forces—each of these bodies entertaining the other with marvellous tales of what they had seen and done in these unknown seas and regions.‡

Having crossed the Frith of Forth, Agricola found himself, for the first time, fairly engaged with the real Caledonians—a people, at the least, as fierce and brave as any he had hitherto contended with. They were not taken by surprise, nor did they wait to be attacked. Descending from the upper country, as Agricola advanced into Fife, strong bands of them fell upon the new Roman forts on the isthmus between the Forth and Clyde, which had been left behind without sufficient defence. Soon after, they made a night attack on the ninth legion, one of the divisions of the main army, and nearly succeeded in cutting it to pieces, in spite of the strong camp in which it was intrenched. This camp was probably situated at Loch Ore, about two miles to the south of Loch Leven, where ditches and other traces of it are still seen. In a general battle, however, to which this nocturnal attack led, the Caledonians were beaten; and, without any other successful exploit, the Romans wintered north of the Frith of Forth, in Fife, where their fleet supplied them with provisions, and kept open their communications with the forts in the south. The Caledonians, no way dispirited, mustered all their clans for the next summer's campaign, and submitted to the supreme command of Galgacus, who ranks with Cassivellaunus and Caractacus, as one of the heroes of the British wars.

At the opening of his seventh and last campaign (A.D. 84), when Agricola moved forward, he found the enemy, to the number of 30,000, posted on the acclivities of *Mons Grampius*, determined to oppose his progress in a general battle. The position of the Caledonians on this occasion, and the field of the great battle, although they have been much disputed, seem to admit of being fixed on very probable grounds. From the nature of the country, Agricola would direct his line of march by the course of the Devon, would turn to the right from Glen-Devon, through the opening of the Ochil hills, along the course of the rivulet which forms Glen-Eagles, leaving the Braes of Ogilvie on his left. He would then pass between Blackford and Auchterarder, towards the Grampians (or Gran-Pen of the British, meaning the head or chief ridge or summit), which he would see before him as he defiled from the Ochils. An easy march would then bring him to the Moor of Ardoch, at the roots of the Grampians, where there are very evident signs of ancient conflicts. The large ditch of a Roman camp can still be traced for a considerable distance; weapons, both British and Roman, have been dug up; and on the hill above Ardoch Moor, are two enormous heaps of stones, called Carnwochel, and Carnlee—probably the sepulchral cairns of the Caledonians who fell in the battle.*

The host of Galgacus fought with great obstinacy and bravery; but they were no more able to resist the disciplined legions of Rome in a pitched battle, than their brethren the southern Britons had been. They were defeated, and pursued with great loss; and the next day nothing was seen in front of the Roman army but a silent and deserted country, and houses involved in smoke and flame. Tacitus relates that some of the flying natives, after tears and tender embraces, killed their wives and children, in order to save them from slavery and the Romans. In the battle the Caledonians used war-chariots, like the southern Britons; and the Roman writer mentions their broadswords and small targets, which remained so long after the peculiar arms of the Highlanders. The victory of Agricola, however valueless in its results, was complete; and, though Tacitus does not record his death on the field, he speaks no more of the brave Galgacus.

In the course of these two campaigns north of the Forth the Romans seem to have derived an uncommon degree of assistance from their fleet, which was probably much better appointed and commanded than on any former occasion. After defeating Galgacus, Agricola sent the ships from the Frith of Tay to make a coasting voyage to the north, which may very properly be called a

voyage of discovery; for though nearly a century and a half had passed since Cæsar's invasions, the Romans were not yet quite certain that Britain was an island, but thought it might have joined the European continent either at the extreme north or north-east, or at some other, to them, unknown point. Agricola's fleet doubled the promontory of Caithness and Cape Wrath, ran down the western coast from the end of Scotland to the Land's End in Cornwall, then turning to the east, arrived safe at the Trutulensian harbour (supposed to be Sandwich), and sailing thence along the eastern coast, returned with glory to the point from which it had started, having thus, according to Tacitus, made the first certain discovery that Britain was an island.

The fears and imagination of the mariners were no doubt much excited during this periplus; and Tacitus, who probably heard the recital from his father-in-law Agricola, and some of the officers of the fleet, was not proof against exaggeration. He tells us that the cluster of islands called the Orcades, till then wholly unknown, was added to the Roman empire (he omits all mention of the Hebrides); that Thule, which had lain concealed in gloom and eternal snows, was seen by the navigators, and that the sea in those parts was *a sluggish mass of stagnated water, hardly yielding to the stroke of the oar, and never agitated by winds and storms.**

Agricola did not keep his army, this second winter, north of the Friths; but withdrawing them by easy marches, put his troops in cantonments behind his works on the isthmus, if not behind those on the Solway and Tyne. Soon after this he was recalled from his command by the jealous, tyrannical Domitian. There is no evidence that Agricola left any garrison on the north of the Frith of Forth; and it appears probable that most of the forts thrown up in the passes of the Grampians to check the incursions of the Caledonians, remains of which still exist at Coupar-Angus, Keithock, Harefaulds, Invergowrie, and other places, were either temporary encampments made on his march northwards, or were erected at a later period by the emperor Severus, and never maintained by the Romans for any length of time. The great difficulty in these regions was not the act of advancing, but that of remaining; and the poverty of the country was, no doubt, as good a defence as the valour of its inhabitants.

It was under Agricola that the Roman dominion in Britain reached its utmost permanent extent; for a few hurried marches, made at a later period, farther into the north of Caledonia, are not to be counted as conquests or acquisition of territory. For the long period of thirty years the island remained so tranquil that scarcely a single mention of its affairs occurs in the Roman annals; and we need scarcely remark that, as history has usually been written, the silence of historians is one of the best proofs of a nation's happiness.

HADRIAN.
From a Copper Coin in the British Museum.

Copper Coin of Hadrian, from one in the British Museum.

But in the reign of Hadrian* the Romans were attacked all along their northern frontiers by the Caledonians, and the whole state of the island was so disturbed as to demand the presence of that energetic emperor (A.D. 120). The conquests of Agricola north of the Tyne and Solway were lost, his advanced line of forts between the Forth and the Clyde swept away, and Hadrian contented himself, without either resigning or reconquering all that territory, with raising a new rampart (much stronger than that drawn by Agricola) between the Solway Frith and the German Ocean. Perhaps it would have been wise in the Romans to have kept to this latter line; but in the following reign of Antoninus Pius (A.D. 138), the governor of Britain, Lollius Urbicus, advanced from it, drove the barbarians before him, and again fixed the Roman frontier at the isthmus between the Clyde and Forth, where he erected a strong rampart on the line of Agricola's forts. The prætentura or rampart of Lollius

* In a general description of the Roman empire, under Trajan, the immediate predecessor of Hadrian, Appian says that the emperor possessed more than one-half of Britain, that he neglected the rest of the island as useless, and derived no profit from the part he possessed.

Urbicus consisted of a deep ditch, and an earthen wall raised on a stone foundation. There were twenty-one forts, at intervals, along the line, which,

from one extremity to the other, measured about thirty-one miles. A military road, as a necessary appendage, ran within the rampart, affording an easy communication from station to station. The opposite points are fixed at Caer-ridden on the Forth, and Dunglas on the Clyde. The works

On the line of Graham's Dyke, said in the neighbourhood to have been a Roman work, but conjectured by Roy to have been erected at a later but very distant period, and of the stones from the wall of Urbicus. The Bridge is over Duntocher Burn, which falls into the Clyde.

appear to have been finished about A.D. 140; and, notwithstanding the perishable materials, the mound can be traced after the lapse of seventeen centuries. Among the people, whose traditions have always retained some notion of its original destination, it is called Græme's or Graham's Dyke. Inscribed stones have been discovered there, recording that the 2nd legion, and detachments from the 6th and the 20th legions, with some auxiliaries, were employed upon the works.*

It had been the boast of the Romans, even from the time of Agricola, that this fortified line was to cover and protect all the fertile territories of the south, and to drive the enemy as it were into another island, barren and barbarous like themselves. But the northern tribes would not so understand it: in the reign of Commodus (A.D. 183) they again broke through this barrier, and swept over the country which lay between it and the wall of Hadrian, and which became the scene of several sanguinary battles with the Romans. About the same time a mutinous spirit declared itself among the legions in Britain, and symptoms were everywhere seen of that decline in discipline and military virtue which led on rapidly to the entire dissolution of the Roman empire. Shortly after, the succession to the empire was disputed with Severus by Clodius Albinus, the governor of Britain. The unequal contest was decided by a great battle in the South of France; but as the pretender Albinus had drained the island of its best troops, the northern tribes took that favourable opportunity of breaking into and desolating the settled Roman provinces. These destructive ravages continued for years, and cost the lives of thousands of the civilized British subjects of Rome.

The Emperor Severus, in his old age (A.D. 207), and though oppressed by the gout and other maladies, resolved to lead an army in person against the northern barbarians. Having made great preparations, he landed in South Britain, and almost immediately began his march to the northern frontier, which was once more marked by the walls of Agricola and Hadrian, between the Solway Frith and the mouth of the Tyne. The tremendous difficulties he encountered as soon as he crossed that line, sufficiently show that the country beyond it had never been thoroughly conquered and settled by the Romans, who invariably attended to the construction of roads and bridges. Even so near to the walls as the present county of Durham the country was an impassable wilderness. Probably there is some exaggeration in the number, and a part of the victims may have fallen under the spear and javelins of the natives; but it is stated that Severus, in his march northward, lost 50,000 men, who were worn out by the incessant labour of draining morasses, throwing raised roads or causeways across them, cutting down forests, levelling mountains, and building bridges. By these means he at length penetrated farther into the heart of Caledonia than any of his predecessors, and struck such terror into the native clans or tribes, who, however, had most prudently avoided any general action, that they supplicated for peace. He went so far to the north that the Roman soldiers were much struck with the length of the summer days and the shortness of the nights; but the *Aræ Finium Imperii Romani*, and the extreme point to which Severus attained in this arduous campaign, seems to have been the end of the narrow promontory that separates the Murray and Cromarty Friths, the conqueror or explorer still leaving Ross, Sutherland, and Caithness, or all the most northern parts of Scotland untouched.* The uses of this most expensive military promenade (for, with the exception of the road-making, it was nothing better) are not very obvious; no Roman army ever followed his footsteps, and he himself could not maintain the old debatable ground between the Tyne and the Forth. Indeed, after his return from the North, his first care was to erect a new frontier barrier in the same line as those of Agricola and Hadrian, but stronger than either of them, thus acknowledging, as it were, the uncertain tenure the Romans had on the country beyond the Solway and the Tyne. For two years the Romans and their auxiliaries were employed in building a wall, which they vainly hoped would for ever check the incursions of the northern clans.

The wall of Agricola, which has been so frequently alluded to, was in reality a long bank or mound of earth, with a ditch, on the borders of which he built, at unequal distances, a range of forts or castles. This work very nearly extended from sea to sea, being about seventy-four miles long; beginning three miles and a half east of Newcastle, and ending twelve miles west of Carlisle. After existing thirty-seven years, this work, which had been much injured, was repaired (about A.D. 121) by Hadrian, who added works of his own to strengthen it. He dug an additional and much larger ditch, and raised a higher rampart of earth, making his new works run in nearly parallel lines with the old. From the date of these operations and repairs the name of Agricola was lost; and the whole, to this day, has retained the name of Hadrian's Wall.† During the ninety years that intervened between the labours of Hadrian and those of Severus, the rampart, not well calculated to withstand the frosts and rains of a cold and wet climate, had, no doubt, suffered extensively, and the barbarians had probably broken through the earthen mound in more places than one. Severus—in this surpassing his predecessors—determined to build with stone: the wall he raised was about 8 feet thick and 12 high to the base of the battlements, so that, viewed in profile, a section of it would appear much like a chair, the main part forming the seat and the embattled part the back.‡ To the wall were added, at unequal distances, a number of stations or towns, 81 castles, and 330 castelets or turrets. At the outside of the wall (to the north) was dug a ditch about 36 feet wide and from 12 to 15 feet deep. Severus's works run nearly parallel with the other

two (those of Agricola and Hadrian), lie on the north of them and are never far distant, but may be said always to keep them in view: the greatest distance between them is less than a mile, the nearest distance about 20 yards,—the medium distance 40 or 50 yards. Exclusive of his wall and ditch, these stations, castles, and turrets, Severus constructed a variety of roads,—yet called *Roman roads*,—24 feet wide and 18 inches high in the centre, which led from turret to turret, from one castle to another, and still larger and more distant roads from the wall, which led from one station or town to another, besides the grand military way (now our main road from Newcastle to Carlisle), which covered all the works, and no doubt was first formed by Agricola, improved by Hadrian, and, after lying neglected for 1500 years, was made complete in 1752.*

As long as the Roman power lasted this barrier

was constantly garrisoned by armed men. The stations were so near to each other that, if a fire was lighted on any one of the bulwarks, it was seen at the next, and so repeated from bulwark to bulwark, all along the line, in a very short time.

Severus had not finished his works of defence when the Caledonian tribes resumed the offensive. The iron-hearted and iron-framed old emperor marched northward with a dreadful vow of extermination; but death overtook him at Eboracum (York), in the early part of the year 211. Caracalla, his son and successor, who had been serving with him in Britain, tired of a warfare in which he could gain comparatively little, hopeless perhaps of ever succeeding in the so-frequently-foiled attempt of subjecting the country north of the walls, and certainly anxious to reach Rome, in order the better to dispose of his brother Geta, whom his father had named co-heir to the empire, made a hasty peace with the Caledonians, formally ceding to them the debatable ground between the Solway and Tyne and the Friths of Clyde and Forth, and then left the island for ever.

After the departure of Caracalla there occurs another long blank,—supposed to have been a tranquil interval,—for during nearly seventy years history scarcely devotes a single page to Britain and its affairs. The formidable stone rampart of Severus had, no doubt, its part in preserving the tranquillity of the southern division of the island, but it was not the sole cause of this happy effect. The territory ceded by Caracalla, extending eighty miles to the north of Severus's wall, and averaging in breadth, from sea to sea, not less than seventy miles, was, in good part, a fertile country, including what are now some of the best lands in Scotland. The clans left in possession of this valuable settlement would naturally acquire some taste for the quiet habits of life,—would imbibe some civilization from the Roman provincials on the south side of the wall,—and then their instinctive love of property and quiet would make them restrain, with arms in their hands, the still barbarous mountaineers to the north of their own territory, whilst their own civilization, such as it might be, would make some little progress among the clans in that direction. And it certainly did happen that, even when the Roman power had long been in a state of decrepitude, no great or decisive invasions took place from the north to the south, until the Scots, a new enemy, pouring in from Ireland with an overwhelming force, drove clan upon clan, and advanced beyond the wall of Severus. This latter event ought always to be taken in connexion with the growing weakness of Rome to account for the catastrophe which followed.

Though it has been generally overlooked, there is another, and a great cause too, which will help to account for the tranquillity enjoyed in the South, or in all Roman Britain. Caracalla imparted the freedom of Rome, and the rights and privileges of the Roman citizen, to all the provinces of the

empire; and thus the Briton exempted from arbitrary spoliation and oppression, enjoyed his patrimony without fear or challenge.* Such a boon merited seventy years of a grateful quiet.

When Britain re-appears in the annals of history, we find her beset by fresh foes, and becoming the scene of a new enterprise, which was frequently repeated in the course of a few following years. In the reign of Diocletian and Maximinian (A.D. 288), the Scandinavian and Saxon pirates began to ravage the coasts of Gaul and Britain. To repress these marauders, the emperors appointed Carausius, a Menapian, to the command of a strong fleet, the head-quarters of which was in the British Channel. The Menapians had divided into several colonies: one was settled in Belgium, one in Hibernia, one in the islands of the Rhine, one at Menevia (now St. David's), in Britain,—and Carausius was by birth either a Belgian or a Briton,—it is not very certain which. Wherever he was born, he appears to have been a bold and skilful naval commander. He beat the pirates of the Baltic, and enriched himself and his mariners with their plunder. It is suspected that he had himself been originally a pirate. He was soon accused of collusion with the enemy, and anticipating, from his great wealth and power, that he would throw off his allegiance, the emperors sent orders from Rome to put him to death. The wary and ambitious sailor fled, in time, with his fleet to Britain, where the legions and auxiliaries rallied round his victorious standard, and bestowed upon him the imperial diadem. The joint emperors of Rome, after seeing their attempts to reduce him repelled with disgrace to their own arms, were fain to purchase peace by conceding to him the government of Britain, of Boulogne, and the adjoining coast of Gaul, together with the proud title of Emperor. Under his reign we see, for the first time, Britain figuring as a great naval power: Carausius built ships of war, manned them in part with the intrepid Scandinavian and Saxon pirates, against whom he had fought; and, remaining absolute master of the Channel, his fleet swept the seas from the mouths of the Rhine to the Straits of Gibraltar. He struck numerous medals, with inscriptions and

BRITISH COIN OF CARAUSIUS.
From an unique Gold Coin in the British Museum.

devices, "which show the pomp and state he assumed in his island empire." The impressive names he borrowed were, "Marcus Aurelius Valerius Carausius." †

He had escaped the daggers of pirates and emperors, but a surer executioner rose up in the person of a friend and confidential minister. He was murdered in the year 297, at Eboracum (York), by Allectus, a Briton, who succeeded to his insular empire, and reigned about three years, when he was defeated and slain by an officer of Constantius Chlorus, to whom Britain fell in succession on the resignation of Diocletian and Maximian (A.D. 296). In this short war we hear of a strong body of Franks and Saxons, who formed the main strength of Allectus's army, and who attempted to plunder London after his defeat. Thus, under Carausius and Allectus, the Saxons must have become acquainted even with the interior of England. Constantius Chlorus died, in the summer of A.D. 306, at Eboracum, or York, a place which seems to have been singularly fatal to royalty in those days. Constantine, afterwards called the Great, then began his reign at York, where he was present at his

CONSTANTINE THE GREAT.
From a Gold Coin in the British Museum.

father's death. After a very doubtful campaign north of the wall of Severus, the details of which are very meagre and confused, this prince left the island, taking with him a vast number of British youths as recruits for his army. From this time to the death of Constantine, in 337, Britain seems again to have enjoyed tranquillity.

The Roman power was, however, decaying; the removal of the capital of the empire from Rome to Constantinople had its effects on the remote provinces of Britain, and, under the immediate successors of Constantine, while the Frank and Saxon pirates ravaged the ill-defended coasts of the south, the Picts, Scots, and Attacots—all mentioned for the first time by historians in the earlier part of the fourth century—begun to press upon the northern provinces, and defy Severus's deep ditches and wall of stone. As the Scots came over from Ireland in boats, and frequently made their attacks on the coast line, it seems not improbable that in some instances their depredations were mistaken for, or mixed up with those of the Saxons. According to

* Palgrave's Rise and Progress of the English Commonwealth, chap. x.
† Palgrave's Hist. England, chap. i.

our insufficient guide,* however, it was the Picts and Scots alone, that, after breaking through the wall of Severus, and killing a Roman general, and Nectaridius, the "Count of the Saxon Shore" in the reign of Julian the Apostate, were found, about three years after (A.D. 367), in the time of the Emperor Valentinian, pillaging the city of London (Augusta), and carrying off its inhabitants as slaves. Theodosius, the distinguished general, and father of the emperor of that name, repelled these invaders, and repaired the wall and the ruined forts in different parts of the south; but the northern districts were never afterwards reduced to order or tranquillity, and even for the partial and temporary advantage they obtained, the Romans were compelled to follow the host of pirates to the extremity of the British islands, "when," as it is expressed in the verses of the poet Claudian, upon this achievement, "the distant Orcades were drenched with *Saxon* gore."

By watching these occurrences, with others that were equally fatal, step by step, as they happen, we shall be the better able to understand how Britain, when abandoned by the Roman legions, was in so reduced and helpless a state as to fall a prey to the barbarians. If that fact is presented to us in an isolated manner, it almost passes our comprehension; but, taken in connexion with great causes and the events of the two centuries that preceded the Saxon conquest, it becomes perfectly intelligible.

Following an example which had become very prevalent in different parts of the disorganized empire, and which had been first set in Britain by Carausius, several officers, relying on the devotion of the legions and auxiliaries under their command, and supported sometimes by the affection of the people, cast off their allegiance to the emperor, and declared themselves independent sovereigns. It was the fashion of the servile historians to call these provincial emperors "tyrants," or usurpers, and to describe Britain especially as being "insula tirannorum fertilis"—an island fertile in usurpers. But, in sober truth, these provincial monarchs had as pure and legitimate a basis for their authority as any of the later emperors of Rome, in whose succession hereditary right and the will of the governed were alike disregarded, and whose election depended on the chances of war and the caprices of a barbarian soldiery; for the right of nomination to the vacant empire so long assumed by the Prætorian bands, and which right, questionable as it was, was still certain and ascertainable—still something like a settled rule—was soon overset, and disallowed by the men of all nations in arms on the frontiers. If a pretension had been set up for purity of Roman blood, or a principle established that the sovereign should be at least a Roman born, there would have been a line of exclusion drawn against the provincial officers; but so far from this being the case, we find that the large majority of the so-called *legitimate* Roman emperors were barbarians by race and blood—natives of Illyria and other more remote provinces, while several of the most distinguished of their number sprung from the very lowest orders of society.

The most noted of the provincial emperors or pretenders that raised their standard in Britain was Maximus (A.D. 382); certainly a man of rank, and probably connected with the imperial family of Constantine the Great. If not born in Britain, he was of British descent, and had long resided in the island, where he had repelled the Picts and Scots. Brave, skilful, and exceedingly popular in Britain, Maximus might easily have retained the island, but his ambition induced him to aim at the possession of all that portion of the Western Roman empire which remained to Gratian; and this eventually not only led to his ruin, but inflicted another dreadful blow on British prosperity. He withdrew nearly all the troops, and so many of the Britons followed him to Gaul, that the island was left almost defenceless, and utterly deprived of the flower of its youth and nobility. Many of these were swept off on the field of battle, many prevented by other causes from ever returning home. Gaul and Germany also gave willing recruits to the army of Maximus, who was left, by the defeat and death of Gratian, the undisputed master of Britain, Gaul, Spain, and Italy. He established the seat of his government for some time at Treves, and is said to have declared Victor, his son by a British wife, his partner in the empire of the west—a proceeding which could scarcely fail of gratifying the host of Britons in his army. But Theodosius, called the Great, the emperor of the east, marched an overpowering army into the west, and, after being defeated in two great battles, Maximus retired to Aquileia, near the head of the Adriatic gulf, on the confines of Italy and Illyria, where he was betrayed to the conqueror, who ordered him to be put to death in the summer of 388.

Theodosius the Great now reunited the Roman empires of the east and west. While Maximus was absent, conquering many lands, the Scots and Picts renewed their depredations in Britain. We are wearied of this sad repetition, but the moment of crisis is now at hand. Chrysantus, an able general, and the lieutenant of Theodosius in Britain, wholly or partially expelled the invaders. Soon after this, Theodosius the Great died (A.D. 395), and again divided, by his will, the empire which his good fortune had reunited. Britain, with Gaul, Italy, and all the countries forming the empire of the west, he bequeathed to his son, Honorius, a boy only ten years of age, whom he placed under the guardianship of the famous Stilicho, who fought long and bravely, but in vain, to prop the falling dignity of Rome. Theodosius was scarcely cold in his grave, when Picts, Scots, and Saxons again sought what they could devour. Stilicho claimed some temporary advantages over them, but the inflated verses of his panegyrist

* Ammianus Marcellinus, lib. xxvii. and xxviii.

are probably as far from the truth, as Claudian is from being a poet equal to Virgil.*

While these events were passing in Britain (A.D. 403), the withered majesty of Rome was shrouded for ever: Africa was dismembered from her empire; Dacia, Pannonia, Thrace, and other provinces were laid desolate; and Alaric the Goth was ravaging Italy, and on his way to the eternal city. In this extremity, some Roman troops which had been lately sent into the island by Stilicho, were hastily recalled for the defence of Italy, and the Britons, again beset by the Picts and Scots, were left to shift for themselves.

The islanders seem to have felt the natural love of independence, but there was no unanimity, no political wisdom, and probably but little good principle among them. Seeing the necessity of a common leader to fight their battles, they permitted the soldiery to elect one Marcus emperor of Britain (A.D. 407); and, shortly after, they permitted the same soldiery to dethrone him, and put him to death. The troops then set up one Gratian, whom, in less than four months, they also deposed and murdered. Their third choice fell upon Constantine, an officer of low rank, or, according to others, a common soldier. They are said to have chosen him merely on account of his bearing the imperial and auspicious name of Constantine; but he soon showed he had other properties more valuable than a name; and had he been contented with the sovereign possession of Britain, he might possibly have foiled its invaders, and reigned with peace and some glory. But, like Maximus, he aspired to the whole empire of the west, and, like Maximus, he fell (A.D. 411), after having caused the loss of vast numbers of British youths, whom he disciplined and took with him to his wars on the continent. At one part of his short career, Constantine made himself master of nearly the whole of Gaul, and put his son Constans, who had previously been a monk at Winchester, in possession of Spain. In the course of this Spanish campaign, it is curious to remark, that in Constantine's army there were two bands of Scots or Attacotti.†

Soon after the fall of Constantine we find Gerontius, a powerful chief, and a Briton by birth, cultivating a close connexion with the Teutonic tribes; and, at his instigation, the barbarians from beyond the Rhine, by whom we are to understand the Saxons, continued to invade the unhappy island. Such underhand villanies are always common in the downfall of nations (but can the Romanized Britons fairly be called a nation?); and we find other chiefs, worse than Gerontius, in secret league with the more barbarous Picts and Scots.

It appears that after the death of Constantine, Honorius, during the short breathing-time allowed him by his numerous enemies, twice sent over a few troops for the recovery and protection of Britain, the sovereignty of which he still claimed; but his exigencies soon obliged him to recall them, and about the year 420, nearly five centuries after Cæsar's first invasion, and after being masters of the best part of it during nearly four centuries, the Roman emperors finally abandoned the island. The Britons had already deposed the magistrates appointed by Rome, proclaimed their independence, and taken up arms for that defence against their invaders which the emperor could no longer give; but the final disseverance was not accompanied by reproach or apparent ill-will. On the contrary, a mutual friendship subsisted for some time after between the islanders and the Romans; and the emperor Honorius, in a letter addressed to the states or cities of Britain, seemed formally to release them from their allegiance, and to acknowledge the national independence.

For some years after the departure of the Romans the historian has to grope his way in the dark; nor is it easy to determine the precise condition of the country. It appears, however, that the free municipal government of the cities was presently overthrown by a multitude of military chiefs, who were principally of British, but partly of Roman origin. It was a period to appreciate the warrior who could fight against the Scots and Picts rather than the peaceful magistrate; and the voice of civil liberty would be rarely heard in the din of war and invasion. In a very few years all traces of a popular government disappeared, and a number of petty chiefs reigned absolutely and tyrannically under the pompous name of kings, though the kingdoms of few of them could have been so large as a second-rate modern county of England. Instead of uniting for their general safety, at least until the invaders were repelled, these *roitelets*, or kinglings, made wars upon each other in the presence of a common danger; and, unwiser even than their far less civilized ancestors in the time of Cæsar, they never thought of forming any great defensive league until it was too late.

It is chiefly in this mad disunion that we must look for the cause of what has created astonishment in so many writers,—the miserable weakness of Britain on the breaking up of the Roman government. Other causes of decline, however, had long been at work. Almost from the first establishment of the Roman power, the British youths raised as recruits were drafted off to the continent, where they were disciplined, and whence few ever returned. It was contrary to the policy of the Romans to teach the provincials the arts of war, and establish them as troops in their own country. The soldiers of Britain were scattered from Gaul to the extremities of the empire; the sedentary and unwarlike remained at home. All this, we think, may account for the absence of a well-disciplined force in the time of need. Moreover, during nearly a century and a half, the drain upon the population for the purposes of Roman war must have been prodigious. In 308 Constantine took with him a vast number of Britons to the continent; this example was followed as the enemies of the empire increased in number and audacity, or as one pretender disputed the imperial crown with another; and we have shown, at periods

* Claud. de Bello Gallico. † Notitia Imperii, sect. xxxviii.

so recent as A.D. 383 and 411, how the pride and flower of the youth were sacrificed in foreign warfare. The exterminating inroads of the Scots and Picts, which began early in the fourth century, and lasted, almost without intermission, until long after the departure of the Roman legions in the fifth century, must have fearfully thinned the population in the north, where arms were most wanted. The curses that destroy mankind were many, and there were none of the blessings that tend to their increase. Gaul and other provinces with which Britain traded, were in as bad a condition as herself, and thus an end was put to foreign commerce, while the internal trade of the country was gradually destroyed by divisions and wars which made it unsafe for the inhabitant of one district to transport his produce into the next, although only at a few miles distance. Under such a state of things, moreover, agriculture would be neglected, for men would not sow in the sad uncertainty whether they or the enemy should reap. Famine and pestilence ensued; and Britain, in common with the greater part of Europe, where the same causes had been in operation, was still further depopulated by these two scourges.

We can scarcely credit Gildas, who wrote about the middle of the sixth century, when he asserts that, at the departure of the legions, the Britons were sunk in such helplessness and ignorance that they could not repair the stone wall of Severus without the guidance and assistance of Roman workmen; but we can understand how they could not muster forces sufficient to man that rampart, and also how the Picts and Scots should render it of no avail by turning the wall on its flanks, and landing in its rear at such distances as best suited their convenience. To maintain an adequate garrison against a vigilant and restless enemy, along a line upwards of seventy miles in length, would demand a very large disposable force. The northern barbarians would not hesitate to launch their boats in the Solway Frith, or at the mouth of the Tyne, north of the wall, and, by sailing south, pass that rampart at one of its extremities, and land on the coast within the wall, or ascend rivers, where that defence, left far in their rear, could present no obstacle to their progress. Their rudest coracles might have performed this coasting service in fine weather; but it is not improbable that during their occasional connexions with the Teutonic or Saxon pirates, who had made some progress in naval architecture, the Scots came into possession of larger and better vessels. An obvious fact is, that from the arrival of the latter people from Ireland, the rampart of Severus began signally to fail in an-

British Coracles.

swering the purposes for which it was intended; though, perhaps, if, instead of taking the usual expression of their breaking through the wall, we read that they turned it at one or other of its extremities, by means of their shoals of boats, we shall generally, in regard to their earlier inroads, be nearer the truth.

But the time was now come when such stratagems, or circuitous courses, were unnecessary, and the Scots and Picts leaped the ditches and scaled the ill-defended walls at all points. The fertile provinces of the south tempted them forward till they reached the very heart of the country, which they racked with a most barbarous hand. It was not their object to occupy the country and settle in it as conquerors (had such been their plan the Britons would have suffered less); their expeditions were forrays; they came to plunder and destroy; and the booty they carried off, season after season, was a less serious loss than the slaughter and devastation that marked their advance and retreat.

At this horrid crisis the more southern and least exposed parts of the island appear to have been occupied by two great parties or factions, which had absorbed all the rest, but could not come to a rational understanding with each other. One of these was a Roman party, including, no doubt, thousands of Roman citizens who had remained on the estates they had acquired, and the many native families that must have been connected with them by marriage and the various ties of civil life; the other was a British party, composed, or pretending to be composed, exclusively of Britons. As soon as such a line of distinction was drawn, dissension was inevitable. The Roman party was headed by Aurelius Ambrosius, a descendant of one of the emperors; the British rallied round the notorious Vortigern. It is not very clear whether, when it was determined a third time to implore the aid of the Romans, both these parties consented to that measure, or whether Aurelius Ambrosius did not take it upon himself, as his rival Vortigern did the calling in of the Saxons only three years after.

The abject prayer, however, entitled 'The Groans of the Britons,' and addressed to Ætius, thrice consul, was sent to the continent (A.D. 441). "The barbarians," said the petitioners, "chase us into the sea; the sea throws us back upon the barbarians; and we have only the hard choice left us of perishing by the sword or by the waves." But Ætius, though as great a warrior as Stilicho, was then contending with Attila, a more terrible enemy even than Alaric, and could not afford a single cohort to the supplicants, whose last, faint reliance on Rome thus fell to the ground.

Religious controversy and the mutual hatred that inflames men when they fix the charge of heresy on one another, completed the anarchy of Britain. This is also a very common, though a very strange concomitant with the fall and last agonies of nations; and the Britons, like the Jews some centuries before, and like the Greeks at Constantinople, besieged by the Turks, ten centuries after, consumed their time in theological subtleties and disputations when the enemy was at their gates, and their last defences were falling above their heads. Had some of the disputants been animated with the same martial spirit as Germanus of Auxerre, a Gallic Bishop, who was sent over by the Pope to decide the controversy, their ruin might have been delayed; but his was a solitary instance. Germanus, who had been a soldier before he became a priest, sallied out with a number of Britons, and to the shouts of Hallelujah, if we may believe the narrative of the Venerable Bede, cut up a party of Picts that were plundering the coast. But this Hallelujah victory, as it was called, was far from being sufficient to stay the march of the invaders, and at length Vortigern took his memorable step, and called the Saxons to his assistance—a fierce and predatory people who had frequently ravaged the island, sometimes by themselves, at others in union with the Picts and Scots, whom they were now to oppose. The people of Armorica or Brittany had already set the example, and, more fortunate than their neighbours proved in the end, they had succeeded, by means of some Saxon allies, in maintaining the independence, and securing the tranquillity of their country.

It may be suspected that, even at this extremity, Vortigern applied for the aid of foreign arms, as much for the purpose of destroying the Roman party in the island, as for the expulsion of its invaders; and this suspicion, though not proved, gains some strength from their past and existing disputes, from the reports of the deadly hatred and bloody conflicts which ensued between Aurelius Ambrosius, the head of the Roman party, and Vortigern, and from the circumstance that Aurelius, from the first landing, made head against the Saxons, while his enemy lived in peace and amity with them for some time.

But, whatever were his motives, Vortigern (A.D. 449) called the hardy freebooters of the Baltic and northern Germany, and they came most readily at his call. The story of a formal embassy to the court or general assembly of the Saxons and the pathetic speeches put into the mouths of the British envoys, seem to be pure inventions of the old historians. Three *chiules* (keels), or long ships, were cruising in the British Channel, under the command of two brothers, distinguished warriors or pirates among the Saxons, who are called Hengist and Horsa, though it is possible those may not have been really their names, but designations merely derived from the standards they bore.* It appears to have been on the deck of these marauding vessels that the Saxons received the invitation, which eventually led to the conquest of a great kingdom. Vortigern appointed his ready guests to

* *Hengst*, or *Hengist*, signifies a stallion; and *Horsa*, or *Hross*, does not require any explanation. It may be remarked, however, that in Danish, *hors* signifies not a *horse*, but a *mare*. The snow-white steed still appears as the ensign of Kent, in England, as it anciently did in the shield of the "Old Saxons" in Germany. Hence the White Horse is still borne on the royal shield of Brunswick-Hanover.—*Palgrave, Hist.* chap. ii.

dwell in the east part of the land, and gave them the Isle of Thanet for their residence, an insulated and secure tract to those who, like the Saxons, had the command of the sea; for the narrow, and, at times, almost invisible rill which now divides Thanet from the rest of Kent, was then a channel of the sea, nearly a mile in width. From this date begins the history of the Saxons in Britain.

Ensign of Kent.

CHAPTER II.

THE HISTORY OF RELIGION.

SECTION I.—DRUIDISM.

HERE are two views under which the history of religion may form a part of the history of a country or a people. There is the history of religious opinion, and there is the history of the established church considered as one of the institutions of the state. There never probably was a period in the history of this country when religion was more mixed up with civil affairs than in that earliest period of which we are now treating. Among the ancient Britons the ministers of religion appear to have been also the chief legislators and administrators of the law, as well as almost the sole depositories of whatever knowledge and civilization existed in the country. As, however, no British history, properly so called, of any kind, has been preserved, all the information that can be given in regard to the religious system which we have reason to believe then prevailed, is such a general account of it as we are enabled to present of the state of the island and its inhabitants in those remote ages in other respects. But even for this our materials are scanty and unsatisfactory; much of the subject is concealed in a darkness which we can have no hope of piercing; and there is so much of fanciful speculation and conjecture in the interpretation that has been put upon the few facts from which we must deduce our conclusions, that at the best the endeavour to shape them into order and meaning is very like tracing pictures in the clouds.

The ancient religion of the Britons is generally believed to have been the same with that of their Gallic neighbours and kinsmen. It is proper, however, to observe, that the scepticism of some modern historical writers has carried them so far as to incline them to doubt whether the Druidism of Gaul ever generally prevailed in Britain. It appears from the narrative which has been given of the Roman conquest, that there were Druids in the island of Anglesey; but it is rather remarkable that no ancient author has expressly mentioned the existence of Druidism in any other part of the country. Both Cæsar and Pliny, indeed, have spoken of the British Druids generally; but their expressions may very well refer merely to the Druidism of Anglesey, or even, as has been suggested, to that of Ireland, which, as Pliny himself informs us, was included under the name of the British islands. If the matter therefore depended entirely on the testimony of the Greek and Roman writers, the common opinion would scarcely rest on sufficient grounds. But the general prevalence of Druidism in Britain appears to be abundantly established both by the material monuments of that system of religion which are spread over all parts of the country, and by popular customs and superstitions, derived from the same source, which have either survived to our own day, or have only recently disappeared.

Cæsar, who of all the ancients has given us the fullest and clearest account of the Druids, expressly records it to have been the common opinion of the Gauls that the Druidical discipline was discovered or invented in Britain, and from thence brought over to Gaul; and he adds that those of the Gauls who wished to obtain a more perfect knowledge of the system were still wont to pass over into Britain to study it. Although, therefore, his sketch professes to relate only to the Druidism of Gaul, we may safely assume that it is in general equally applicable to that of Britain. The Druids, according to Cæsar, formed throughout the whole of Gaul one of the two honourable classes of the population, the Equites, or military order, forming the other. The office of the Druids was that of presiding over sacred things, of performing all public and private sacrifices, and generally of directing all religious matters. They were also the teachers of great numbers of youth, who resorted to them for instruction in their discipline. But the function which procured them the highest honour was that which they discharged as the judges by whom were determined almost all disputes or litigations, both public and private. If any criminal act was done, if any murder was committed, if any difference arose about an inheritance or the boundaries of land, the decision lay with them; they appointed the reward or the penalty. But even in this capacity of administrators of the law, religion was the instrument they made use of to enforce obedience to their sentences. Whoever he was, whether a private individual or a person discharging a public office, that on any occasion refused to abide by their decree, they interdicted him from being present at the sacrifices. The exercise of this power, resembling the modern ecclesiastical weapon of excommunication, inflicted a punishment of the greatest severity. The person interdicted was held

as one impious and accursed; all men shunned him, and fled from his approach and converse, lest they should receive injury from his very touch; he lost the protection of the law, and was excluded from all offices of honour.

The Druidical hierarchy, it is plain from this account, held in their hands the regulation and control of by far the most important part of the internal affairs of the community, thus occupying a position in the state very similar to that formerly held in many countries by the Christian priesthood; but, if anything, still more commanding than that was, even in the darkest period of modern history. It was distinctly another power, if not superior to the civil power, at least certainly not in any respect in subjection to it. Cæsar goes on to tell us that there was one head Druid set over the whole body, who was elected to his place of supreme authority by the suffrages of the rest, whenever it happened that there was no single individual of their number whose merits were so pre-eminent as to prevent all competition for the vacant dignity. The struggle, however, among the partisans of various candidates for the primacy sometimes came to a contest of arms. The Druids of Gaul were wont to hold a meeting at a certain time of every year in a consecrated place in the territory of the Carnutes, which was considered to be the central region of Gaul; and hither all people flocked who had any litigations, and submitted themselves to their decisions and judgments. The spot here referred to is supposed to have been that on which the town of Dreux, in the Pais de Chartrain, now stands; and here it is thought the chief Druid had his residence. The seat of the Druidical primacy in Britain is conjectured to have been the isle of Anglesey.

Cæsar goes on to state that the Druids were not accustomed to take part in war, nor did they pay any taxes, enjoying both exemption from military service and freedom from all other public burdens. The consequence of these privileges was, that numbers of persons both came of their own accord to be trained up in their discipline, and were sent to them by their parents and relations. A part of the education of these pupils was said to consist in learning by heart a great number of verses, and on that account some of them remained twenty years at their studies; for the Druids did not deem it right to commit their instructions to writing, although, in most other things, and in both their public and private affairs of business, they used, Cæsar seems to say, according to the reading of most manuscripts of his text, the Greek characters. Even if the epithet Greek is an interpolation here, as some critics have supposed, the important part of the statement remains unaffected, namely, that the Druids were familiar with the art of writing. Cæsar supposes that they refrained from committing their religious doctrines to writing for two reasons: first, because they did not wish that the knowledge of their system should be diffused among the people at large; secondly, because they thought that the learners, having written characters to trust to, would bestow less pains in cultivating their memory, it generally happening that diligence in acquiring knowledge, and the exercise of the power of memory, are relaxed under a sense of the security which written characters afford.

He then proceeds to give an account of the doctrines taught by the Druids. The chief doctrine which they inculcated was that commonly known by the name of the metempsychosis or transmigration of souls, a favourite principle of some of the most ancient religious and philosophical creeds both of the east and of the west. They asserted that when a man died his spirit did not perish, but passed immediately into another body; and this article of faith, by its power of vanquishing the fear of death, they considered to be the most efficacious that could be instilled into the minds of men for the excitement of heroic virtue. They also discussed and delivered to their pupils many things respecting the heavenly bodies and their motions, the magnitude of the universe and the earth, the nature of things, and the force and power of the immortal gods. The whole nation of the Gauls, Cæsar remarks, was greatly given to religious observances; and on that account those persons who were attacked by any serious disease, or were involved in the dangers of warfare, were accustomed either to immolate human victims, or to vow that they would, and to employ the Druids to perform these sacrifices; their opinion being that the gods were not to be propitiated, unless for the life of a man the life of a man were offered up. There were also sacrifices of the same kind appointed on behalf of the state. Sometimes images of wicker work, of immense size, were constructed, which, being filled with living men, were then set fire to, and the men perished in the flames. They regarded the destruction in this manner of persons taken in the commission of theft or robbery, or any other delinquency, as most agreeable to the gods; but when the supply of such criminals was insufficient, they did not hesitate to make victims of the innocent.

The account is concluded by a short enumeration of the divinities worshipped by the Gauls. The chief object of their adoration, it is stated, was Mercury: of this god they had numerous images; they regarded him as the inventor of all arts, as the guide of men in highways and in their journeys, and as having the greatest power in everything belonging to the pursuits of wealth and commerce. After him they worshipped Apollo, Mars, Jupiter, and Minerva, holding nearly the same opinion with regard to each as other nations; namely, that Apollo warded off diseases—that Minerva was the first instructor in manufactures and handicrafts—that Jupiter was the sovereign of the inhabitants of heaven—that Mars was the ruler of war. To him, when they came to the determination of engaging in a battle, they commonly devoted whatever spoil they had taken in war; out of what remained to them after the fight, they sacrificed everything that was alive, and gathered

the rest together into one spot. Heaps of things thus put aside in consecrated places were to be seen in many of the states, and it was rarely that any person was so regardless of religion as to dare either secretly to retain any part of the spoil in his own possession, or to take it away when thus laid up: for such a crime there was appointed a very severe punishment, accompanied with torture. It is added that all the Gauls believed themselves to be descended from Father Dis or Pluto, saying that the fact was declared to be so by the Druids. On that account, they reckoned time not by days but by nights, so regulating their birthdays, and the beginnings of months and years, that the night came first and then the day.*

Such is the outline of the Druidical superstition and system of ecclesiastical polity which has been left to us by this accurate and sagacious observer, not writing from hearsay, but describing what he saw with his own eyes, or had otherwise the best opportunities of learning on the spot. Of all the writers in whom we find any notices of the discipline or doctrines of the Druids, there is perhaps scarcely another who can be regarded as speaking to us on the subject from his own observation. We have no reason to suppose that any of the rest ever was in a country where the Druidical religion was established. Some of the ancient authorities who are commonly referred to can scarcely be considered as even the contemporaries of Druidism either in Britain or Gaul.

As in these circumstances was to be expected, the account given by Cæsar may be affirmed not to be contradicted in any material particular, by those supplied to us from other quarters; but his sketch is a rapid and general one, and other ancient writers have enabled us to fill it up in various parts with some curious and interesting details. Such of these as seem to be most deserving of attention, we shall now proceed to notice.

It is remarkable that Cæsar nowhere makes any mention of the sacred groves and the reverence paid to the oak, which make so great a figure in most of the other accounts of Druidism. Among various derivations which have been given of the name of the Druids, the most probable seems to be that which brings it from *Drui*, the Celtic word for an oak, corruptly written in the modern Irish *Droi*, and more corruptly *Draoi*, but without the pronunciation being altered, and making in the plural *Druidhe*.† *Drui* is the same word with *Drus*, which signifies an oak in the Greek language; and also, indeed, with the English *tree*, which in the old Mæsogothic was *triu*. The name *Dryades* given to their nymphs or goddesses of the woods by the Greeks, is only another form of the name *Druids*, given to their priests of the woods by the Celts. It is curious that Diodorus Siculus calls the philosophers and theologians of the Gauls, by which he evidently means the Druids, *Saronides*; the original signification of the Greek word *Saron*, according to Hesychius, being an oak.

* Cæsar de Bello Gallico, vi. 13, 14, 16, 17, 18. † Toland, p. 17.

"If you come," says the philosopher Seneca, writing to his friend Lucilius, "to a grove thick planted with ancient trees which have outgrown the usual altitude, and which shut out the view of the heaven with their interwoven boughs, the vast height of the wood, and the retired secrecy of the place, and the wonder and awe inspired by so dense and unbroken a gloom in the midst of the open day, impress you with the conviction of a present deity."* These natural feelings of the human mind were taken advantage of and turned to account by the Druids, as we find them to have been in the other most primitive and simple forms of ancient superstition. Pliny informs us that the oak was the tree which they principally venerated, that they chose groves of oak for their residence, and performed no sacred rites without the leaf of that tree. The geographer Pomponius Mela describes them as teaching the youths of noble families, that thronged to them in caves, or in the depths of forests. We have seen that when (A.D. 61) Suetonius Paulinus attacked and made himself master of the isle of Anglesey, he cut down the Druidical groves, "hallowed," says Tacitus, "with cruel superstitions; for they held it right to stain their altars with the blood of prisoners taken in war, and to seek to know the mind of the gods from the fibres of human victims."† The poet Lucan, in a celebrated passage on the Druids and the doctrines of their religion, has not forgotten their sacred groves:—

"The Druids now, while arms are heard no more,
Old mysteries and barbarous rites restore;
A tribe, who singular religion love,
And haunt the lonely coverts of the grove.
To these, and these of all mankind alone,
The gods are sure reveal'd, or sure unknown.
If dying mortals' dooms they sing aright,
No ghosts descend to dwell in dreadful night;
No parting souls to grisly Pluto go,
Nor seek the dreary silent shades below;
But forth they fly, immortal in their kind,
And other bodies in new worlds they find.
Thus life for ever runs its endless race,
And like a line Death but divides the space,
A stop which can but for a moment last,
A point between the future and the past.
Thrice happy they beneath their northern skies,
Who that worst fear, the fear of death, despise:
Hence they no cares for this frail being feel,
But rush undaunted on the pointed steel;
Provoke approaching fate, and bravely scorn
To spare that life which must so soon return."‡

No Druidical grove, we believe, now remains in any part of Great Britain; but within little more than a century, ancient oaks were still standing around some of the circles of stones set upright in the earth, which are supposed to have been the temples of the old religion. In the parish of Holywood in Dumfries-shire, for instance, there is such a temple, formed of twelve very large stones, inclosing a piece of ground about eighty yards in diameter, and although there are now no trees to be seen near the spot, "there is a tradition," says an account of the parish published in 1791, "of their existing in the last age;" and it is added, "many of their roots have been dug out of the ground by the present minister, and he has still

‡ Pharsalia i. 462; Rowe's translation. See also, iii. 399, &c.

Grove of Oaks.—From a Picture by Ruysdael.

one in his possession." * As far as can be gathered from the vestiges of such of these sacred inclosures as remain least defaced, they seem in their perfect state to have generally consisted of the circular row or double row of stones in the central open space (the proper *lucus*, or place of light), and beyond these, of a wood surrounded by a ditch and a mound. A holy fountain, or rivulet, appears also to have usually watered the grove. The reverence for rivers or streams, and more especially for springs or wells, is another of the most prevalent of ancient superstitions; and it is one which, having, along with many other Pagan customs, been adopted and sanctioned, or at least tolerated, by Christianity as first preached by the Roman missionaries, and being, besides, in some sort recommended to the reason by the high utility of the object of regard, has not even yet altogether passed away. The cultivation, too, or the decay from lapse of time, which has almost everywhere swept away the antique religious grove, has for the most part spared the holy well. In the centre of the circle of upright stones is sometimes found what is still called a *cromlech*, a flat stone supported in a horizontal position upon others set perpendicularly in the earth, being apparently the altar on which the sacrifices were offered up, and on which the sacred fire was kept burning. The name *cromlech* is said to signify the stone for bowing to or worshipping. Near to the temple frequently rises a *carnedd*, or sacred mount, from which it is conjectured that the priests were wont to address the people.

The Platonic philosopher Maximus Tyrius, tells us that the Celtic nations all worshipped Jupiter

* Sinclair's Statistical Account of Scotland, i. 18.

KITS COTY HOUSE, a Cromlech, near Aylesford, Kent.

under the visible representation of a lofty oak. But the most remarkable of the Druidical superstitions connected with the oak, was the reverence paid to the parasitical plant called the mistletoe, when it was found growing on that tree. Pliny has given us an account of the ceremony of gathering this plant, which, like all the other sacred solemnities of the Druids, was performed on the sixth day of the moon, probably because the planet has usually at that age become distinctly visible. It is thought that the festival of gathering the mistletoe was kept always as near to the 10th of March, which was their New Year's Day, as this rule would permit. Having told us that the Druids believed that God loved the oak above all the other trees, and that everything growing upon that tree came from heaven, he adds, that there is nothing they held more sacred than the mistletoe of the oak. Whenever the plant was found on that tree, which it very rarely was, a procession was made to it on the sacred day with great form and pomp. First two white bulls were bound to the oak by their horns; and then a Druid clothed in white mounted the tree, and with a knife of gold cut the mistletoe, which another, standing on the ground, held out his white robe to receive. The sacrifice of the victims and festive rejoicings followed. The sacredness of the mistletoe is said to have been also a part of the ancient religious creed of the Persians, and not to be yet forgotten in India; and it is one of the Druidical superstitions of which traces still survive among our popular customs. Virgil, a diligent student of the poetry of old religions, has been thought to intend an allusion to it by the golden branch which Æneas had to pluck to be his passport to the infernal regions. Indeed the poet expressly likens the branch to the mistletoe:—

"Quale solet silvis brumali frigore viscum
Fronde virere novâ, quod non sua seminat arbos,
Et croceo fetu teretes circumdare truncos;
Talis erat species auri frondentis opacâ
Ilice; sic leni crepitabat bractea vento."

ÆN. VI. 209.

As in the woods beneath mid-winter's snow
Shoots from the oak, the fresh-leaved mistletoe,
Girding the dark stem with its saffron glow;
So sprung the bright gold from the dusky rind,
So the leaf rustled in the fanning wind.

The entire body of the Druidical priesthood appears to have been divided into several orders or classes; but there is some uncertainty and difference of opinion as to the characters and offices of each. Strabo and Ammianus Marcellinus are the ancient authorities upon this head; and they both make the orders to have been three—the Druids, the Vates, and the Bards. Marcellinus calls the Vates, according to one reading, *Euhages*, which is most probably a corruption, but according to another *Eubates*, which is evidently the same with Strabo's *Ouates*, or Vates. It is agreed that the Bards were poets and musicians. Marcellinus says that they sung the brave deeds of illustrious men, composed in heroic verses, with sweet modulations of the lyre; and Diodorus Siculus, who does not include them among the theologians and philoso-

phers whom he calls Saronides, also mentions them in nearly the same terms. He states that they composed poems, some of which were celebrations, and others invectives, and sung them to the music of an instrument resembling the Greek and Roman lyre. The Vates, according to Strabo, were priests and physiologists; but Marcellinus seems to assign to them only the latter office, saying that they inquired into nature, and endeavoured to discover the order of her processes and her sublimest secrets. The Latin word *vates*, it may be observed, although frequently used for a poet, and sometimes indeed for a person of very eminent skill in other intellectual arts, seems properly to have always implied something prophetic or divine. Such is said also to be the signification of the Celtic *Faidh*, which, in modern Irish, is used for a prophet, and is believed to have been in former times the name of an order of soothsayers or sacred poets both in Ireland and in Scotland. The Druids Strabo speaks of as combining the study of physiology with that of moral science; Marcellinus describes them as persons of a loftier genius than the others, who addressed themselves to the most occult and profound inquiries, and rising in their contemplations above this human scene declared the spirits of men to be immortal. Some modern writers, disregarding altogether these ancient authorities, have conjectured that the Druids, as forming the chief order of the hierarchy, had under them first the Bards, whom they make the same with the Saronides, and to have been poets and musicians; secondly, the Euhages

Group of Arch-Druid and Druids

or Eubages, who studied natural philosophy; and, thirdly, the Vates, who performed the sacrifices. It is at least highly probable that all these classes were considered as belonging to the Druidical body.* A remarkable fact mentioned by Marcellinus is that the Druids, properly so called, lived together in communities or brotherhoods. This, however, cannot have been the case with all the members of the order; for we have reason to believe that the Druids frequently reckoned among their number some of the sovereigns of the Celtic states, whose civil duties of course would not permit them to indulge in this monastic life. Divitiacus, the Æduan prince, who performed so remarkable a part, as related by Cæsar, in the drama of the subjugation of his country by the Roman arms, is stated by Cicero to have been a Druid. Cicero tells us that he knew Divitiacus, who was wont both to profess to be familiar with that study of nature which the Greeks called physiology, and to make predictions respecting future events, partly by augury, partly by conjecture.† Strabo records it to have been a notion among the Gauls that the more Druids they had among them, the more plentiful would be their harvests, and the greater their abundance of all good things; and we may therefore suppose that the numbers of the Druids were very considerable.

Toland, who in what he calls his "Specimen of the Critical History of the Celtic Religion and Learning," has collected many curious facts, and who probably had authorities of one kind or another for most of the things he has advanced, although they were unfortunately reserved for a subsequent work of greater detail, which never appeared, has given us the following account of the dress of the Druids. Every Druid, he informs us, carried a wand or staff, such as magicians in all countries have done, and had what was called a Druid's egg (to which we shall advert presently) hung about his neck inclosed in gold. All the Druids wore the hair of their heads short, and their beards long; while other people wore the hair of their heads long, and shaved all their beards with the exception of the upper lip. "They likewise," he continues, "all wore long habits, as did the Bards and the Vaids (the Vates); but the Druids had on a white surplice whenever they religiously officiated. In Ireland, they, with the graduate Bards and Vaids, had the privilege of wearing six colours in their breacans or robes (which were the striped braccæ of the Gauls, still worn by the Highlanders); whereas the king and queen might have in theirs but seven, lords and ladies five, governors of fortresses four, officers and young gentlemen of quality three, common soldiers two, and common people one. These particulars appear to have been collected from the Irish traditions or Bardic manuscripts.

† De Divinatione, i. 41.

It is commonly said that there were Druidesses as well as Druids, and some modern writers have even given us a minute account of the several degrees or orders of this female hierarchy; but the notion does not seem to rest upon any sufficient authority. On the contrary, Strabo expressly tells us that it was a rule with the Druids, which they most strictly observed, never to communicate any of their secret doctrines to women, having no faith, it seems, in the doctrine held by some of the moderns, that a woman can keep a secret.

Vopiscus, indeed, relates that the Emperor Aurelian on one occasion consulted certain female fortune-tellers of Gaul, whom this historian calls Druidesses, and that one of these personages also another time delivered a warning to Alexander Severus; but the women in question seem to have been merely a sort of sibyls or witches. The art of divination, as we have already seen from the example of Divitiacus, was one of the favourite pretensions of the Druidical, as it has been of most other systems of superstition. The British Druids, indeed, appear to have professed the practice of magic in this and all its other departments. Pliny observes that in his day this supernatural art was cultivated with such astonishing ceremonies in Britain, that the Persians themselves might seem to have acquired the knowledge of it from that island. In the Irish tongue a magician is still called Drui, and the magic art Druidheach, that is Druidity, as it might be literally translated.* In the Irish translation of the Scriptures the magicians of Egypt are called the Druids of Egypt, and the same name is given to the magi or wise men from the east mentioned in the gospel of St. Matthew. Ælian tells us that the Druids of Gaul were liberally paid by those who consulted them for their revelations of the future, and the good fortune they promised. Among their chief methods of divination was that from the entrails of victims offered in sacrifice. One of their practices was remarkable for its strange and horrid cruelty, if we may believe the account of Diodorus Siculus. In sacrificing a man they would give him the mortal blow by the stroke of a sword above the diaphragm, and then, according to rules which had descended to them from their forefathers, they would draw their predictions from inspection of the posture in which the dying wretch fell, the convulsions of his quivering limbs, and the direction in which the blood flowed from his body. A wild story is told by Plutarch, in his Treatise on the Cessation of Oracles, about a discovery made by a person named Demetrius, of an island in the neighbourhood of Britain, inhabited by a few Britons who were esteemed sacred and inviolable by their countrymen. Immediately after his arrival, it is affirmed, the air grew black and troubled, and strange apparitions were seen; the winds rose to a tempest, and fiery spots and whirlwinds appeared dancing towards the earth. Demetrius was told that all this turmoil of the elements was occasioned

* Toland, p. 20.

by the death of one of a certain race of invisible beings who frequented the isle. It has been conjectured that this island was either Anglesey, or one of the Hebrides, and that the persons inhabiting it were Druids, who thus affected a commerce with the world of spirits and supernatural powers. Somewhat resembling this account is that given by Mela of the island of Sena, which he describes as situated in the British sea, opposite to the coast inhabited by the Osismi, and which is believed to be the isle of Sain, near the coast of Britany. It was famous, according to the ancient geographer, for the oracle of a certain Gallic divinity. The priestesses, who were called Barrigenae, were said to be nine in number, and to have vowed perpetual virginity. They were thought to be endowed with various singular powers, such as that of raising the waves and winds with their songs, of changing themselves into whatever animals they chose, of healing diseases which were incurable by the skill of others, and of knowing and predicting future events; these, however, they revealed only to mariners who came on purpose to consult them. It is highly probable that the moon was the deity which was here worshipped.*

There is reason to believe that the Druids, like other ancient teachers of religion and philosophy, had an esoteric or secret doctrine, in which the members of the order were instructed, of a more refined and spiritual character than that which they preached to the multitude. Diogenes Laertius acquaints us, that the substance of their system of faith and practice was comprised in three precepts, namely, to worship the gods, to do no evil, and to behave courageously. They were reported, however, he says, to teach their philosophy in enigmatic apophthegms. Mela also expresses himself as if he intended us to understand that the greater part of their theology was reserved for the initiated. One doctrine, he says, that of the immortality of the soul, they published, in order that the people might be thereby animated to bravery in war. The language of this writer would rather imply, that what they promised was merely the continuance of existence in another world. The people, he tells us, in consequence of their belief in this doctrine, were accustomed when they buried their dead to burn and inter along with them things useful for the living; a statement which is confirmed by the common contents of the barrows or graves of the ancient Britons. He adds a still better evidence of the strength of their faith. They were wont, it seems, to put off the settlement of accounts and the exaction of debts, till they should meet again in the shades below. It also sometimes happened, that persons not wishing to be parted from their friends who had died, would throw themselves into the funeral piles of the objects of their attachment, with the view of thus accompanying them to their new scene of life. It does not seem to be easy to reconcile these statements with the common supposition that the doctrine on the subject of the immortality of the soul taught by the Druids, was that of the Metempsychosis, or its transmigration immediately after death into another body. Yet we find the practice of self-immolation also prevalent in India, along with a belief in the soul's transmigration, under the Brahminical system of religion. Perhaps we may derive some assistance in solving the difficulty, from the statement which has been little noticed of Diodorus Siculus. This writer, speaking of the Gauls, says that they believed that the souls of the dead returned to animate other bodies after the lapse of a certain number of years. In the mean time, it seems to have been thought, they lived with other similarly disembodied spirits in some other world; for it is added that, in this belief, when they buried their dead they were wont to address letters to their deceased friends and relations, which they threw into the funeral pile, as if the persons to whom they were addressed would in this way receive and read them. Other writers, in their account of the Druidical doctrine of the immortality of the soul, expressly affirm that the spirits of the dead were thought to enjoy their future existence only in another world.* There has also been some dispute as to whether the Druidical metempsychosis included the transmigration of the soul into animals, as well as from one to another human form.†

It has been conjectured that the fundamental principle of the Druidical esoteric doctrine was the belief in one God. For popular effect, however, this opinion, if it ever was really held even by the initiated, appears to have been from the first wrapped up and disguised in an investment of materialism, as it was presented by them to the gross apprehension of the vulgar. The simplest, purest, and most ancient form of the public religion of the Druids, seems to have been the worship of the celestial luminaries and of fire. The sun appears to have been adored under the same name of Bel or Baal, by which he was distinguished as a divinity in the paganism of the East.‡ We have already had occasion to notice their observance of the moon in the regulation of the times of their great religious festivals. These appear to have been four in number: the first was the 10th of March, or the sixth day of the moon nearest to that, which, as already mentioned, was their New Year's Day, and that on which the ceremony of cutting the misletoe was performed; the others were the 1st of May, Midsummer Eve, and the last day of October. On all these occasions the chief celebration was by fire. On the eve of the festival of the 1st of May, the tradition is, that all the domestic fires throughout the country were extinguished, and lighted again the next day from the sacred fire kept always burning in the temples. "The Celtic nations," observes Toland, "kindled other fires on Midsummer eve, which are still continued by the Roman

‡ The author of "Britannia after the Romans," however, denies that the Celtic Beli or Belinus has any connexion with the Oriental Baal or Bel.

Catholics of Ireland, making them in all their grounds, and carrying flaming brands about their cornfields. This they do likewise all over France, and in some of the Scottish isles. These Midsummer fires and sacrifices were to obtain a blessing on the fruits of the earth, now becoming ready for gathering; as those of the 1st of May, that they might prosperously grow; and those of the last of October were the thanksgiving for finishing their harvest." In Ireland, and also in the north of Scotland, the 1st of May, and in some places the 21st of June, is still called Beltein or Beltane, that is, the day of the Bel Fire; and imitations of the old superstitious ceremonies were not long ago still generally performed. In Scotland a sort of sacrifice was offered up, and one of the persons present, upon whom the lot fell, leaped three times through the flames of the fire. In Ireland the cottagers all drove their cattle through the fire. Even in some parts of England the practice still prevails of lighting fires in parishes on Midsummer eve.*

The adoration of fire was the adoration of what was conceived to be one of the great principles or sovereign powers of nature. Water was another of the elements, or ultimate constituents of things, as they were long deemed to be, which appears to have been in like manner held sacred, and in some sort worshipped. There is reason to believe that as the sun and moon, although sometimes worshipped together, had at other times their rival and contending votaries; so the adorers of water were sometimes considered as the opponents of those of fire. We know, at least, that contests took place between them in the East; and there are some traces to be detected of the separation and mutual aversion of the two creeds, also in the West. All these differences, no doubt, originated in the preferences, gradually more and more displayed, by some persons for one, by others for another, of several imaginary deities which had been all at first the objects of a common worship, till at last the preference became an exclusive adoption, and the god of the rival sect was either altogether deprived of divine honours and veneration, or, what was more in accordance with the spirit of superstition, was denounced as a demon or power of evil, and as such still believed in, though with trembling and abhorrence. But after this state of things had lasted for some time, it might naturally enough happen, in favourable circumstances, that the divided creeds would lay aside their hostility and again coalesce; the worship of Baal, for instance, thus recombining with that of Ashtaroth, or the adorers of fire and those of water consenting to bow down and make their offerings together to both deities. Some indication of such a reconcilement as this last, seems to be presented in the doctrine, according to Strabo, held by the Druids respecting the destiny of the material world, which they taught was never to be entirely destroyed or annihilated, but was nevertheless to undergo an endless succes-

sion of great revolutions, some of which were to be effected by the power of fire, others by that of water.

Another of the most remarkable principles of primitive Druidism appears to have been the worship of the Serpent; a superstition so widely extended, as to evince its derivation from the most ancient traditions of the human race. Pliny has given us a curious account of the anguinum, or serpent's egg, which he tells us was worn as their distinguishing badge by the Druids. He had himself seen it, he says, and it was about the bigness of an apple, its shell being a cartilaginous incrustation, full of little cavities like those on the legs of the polypus. Marvels of all kinds were told of this production. It was said to be formed, at first, by a great number of serpents twined together, whose hissing at last raised it into the air, when it was to be caught, ere it fell to the ground, in a clean white cloth, by a person mounted on a swift horse, who had immediately to ride off at full speed, the enraged serpents pursuing him until they were stopped (as witches still are supposed to be in the popular faith) by a running water. If it were genuine it would, when enchased in gold and thrown into a river, swim against the stream. All the virtues also of a charm were ascribed to it. In particular, the person who carried it about with him was ensured against being overcome in any dispute in which he might engage, and might count upon success in his attempts at obtaining the favour and friendship of the great. It has been conjectured on highly probable grounds, that the great Druidical temples of Avebury, of Stonehenge, of Carnac in Britany, and most of the others that remain both in Britain and Gaul, were dedicated to the united worship of the sun and the serpent, and that the form of their construction is throughout emblematical of this combination of the two religions.*

But, however comparatively simple and restricted may have been the Druidical worship in its earliest stage, there is sufficient evidence that, at a later period, its gods came to be much more numerous. Cæsar, as we have already seen, mentions among those adored by the Gauls, Mercury, Apollo, Mars, Jupiter, and Minerva. It is to be regretted that the historian did not give us the Celtic names of the deities in question, rather than the Roman names which he considered, from the similarity of attributes, to be their representatives. Livy however tells us that the Spanish Celts called Mercury, Teutates; the same word, no doubt, with the Phœnician Taaut, and the Egyptian Thoth, which are stated by various ancient writers to be the same with the Hermes of the Greeks, and the Mercury of the Latins.† Mercury is probably, also, the Oriental Budha, and the Scandinavian Woden; the same day of the week, it is observable, being in the Oriental, the Northern, and the Latin countries respectively, called after or dedicated to these three names. Hesus appears to

GAULISH DEITIES.—From Roman Bas-reliefs under the Choir of Notre Dame, Paris.

have been the Celtic name for Mars. Apollo seems to have been considered the same with the Sun, as he also was by the Greeks and Romans, and to have been known by the name of Bel, the same with the Oriental Baal. Jupiter is thought to have been called Jow, which means young, from his being the youngest son of Saturn, whom both Cicero and Dionysius of Halicarnassus affirm to have been also adored by the Celtic nations. Bacchus, Ceres, Proserpine, Diana, and other gods of Greece and Rome, also appear to have all had their representatives in the Druidical worship; if, indeed, the classic theology did not borrow these divinities from the Celts. Another of the Celtic gods was Taranis, whose name signifies the God of Thunder.

The earliest Druidism seems, like the kindred superstition of Germany, as described by Tacitus, to have admitted neither of covered temples nor of sculptured images of the gods. Jupiter, indeed, is said to have been represented by a lofty oak, and Mercury by a cube—the similarity of that geometrical figure on all sides typifying that perfect truth and unchangeableness which were held to belong to this supreme deity; but these are to be

considered not as attempts to imitate the supposed bodily forms of the gods, but only as emblematic illustrations of their attributes. At a later period, however, material configurations of the objects of worship seem to have been introduced. Gildas speaks of such images as still existing in great numbers in his time, among the unconverted Britons. They had a greater number of gods, he says, than the Egyptians themselves, there being hardly a river, lake, mountain, or wood, which had not its divinity. Montfaucon has given an engraving of an image of the god Hesus, and another of another Celtic god, whose name appears to have been Cernunnos, from bas-reliefs found under the choir of the church of Nôtre Dame, at Paris, in 1711. In the preceding page we have inserted copies of both.

With regard to the peculiar forms of the Druidical worship, little information has come down to us. Pliny has merely recorded that, in offering the sacrifice, the officiating priest was wont to pray to the divinity to send down a blessing upon the offerer. Popular tradition has preserved the memory of the practice by the worshippers of the Deasuil or Deisol, which consisted in moving round, in imitation of the apparent course of the sun, from the east by the south to the west.* Pliny states that at some of the sacred rites of the Britons the women went naked, only having their skins stained dark with the juice of the woad.

As for the human sacrifices of which Cæsar speaks, his account is fully borne out by the testimonies of various other ancient authors. Strabo describes the image of wicker or straw, in which, he says, men and all descriptions of cattle and beasts were roasted together. He also relates, that sometimes the victims were crucified, sometimes shot to death with arrows. The statement of Diodorus Siculus is, that criminals were kept under ground for five years, and then offered up as sacrifices to the gods by being impaled, and burned in great fires along with quantities of other offerings. He adds, that they also immolated the prisoners they had taken in war, and along with them devoured, burned, or in some other manner destroyed likewise whatever cattle they had taken from their enemies. Plutarch tells us, that the noise of songs and musical instruments was employed on these occasions to drown the cries of the sufferers. † Pliny is of opinion that a part of every human victim was ate by the Druids; but what reason he had for thinking so does not appear, nor does the supposition seem to be probable in itself. Upon the subject of the practice of human sacrifice it has been observed, that "if we rightly consider this point we shall perceive that, shocking as it is, it is yet a step towards the humanizing of savages; for the mere brute man listens only to his ferocious passions and horrid appetites, and slays and devours all the enemies he can conquer; but the priest, persuading him to select only the best and bravest as sacrifices to his protecting deity, thereby, in fact, preserves numberless lives, and puts an end to the cannibalism which has justly been looked upon as the last degradation of human nature." *

The origin of Druidism, and its connexion with other ancient creeds of religion and philosophy, have given occasion to much curious speculation. Diogenes Laertius describes the Druids as holding the same place among the Gauls and Britons with that of the Philosophers among the Greeks, of the Magi among the Persians, of the Gymnosophists among the Indians, and of the Chaldeans among the Assyrians. He also refers to Aristotle as affirming in one of his lost works that philosophy had not been taught to the Gauls by the Greeks, but had originated among the former, and, from them, had passed to the latter. The introduction into the Greek philosophy of the doctrine of the Metempsychosis is commonly attributed to Pythagoras; and there are various passages in ancient authors which make mention of, or allude to some connexion between that philosopher and the Druids. Abaris, the Hyperborean, as has been noticed above, is by many supposed to have been a Druid; and he, Iamblicus tells us, was taught by Pythagoras to find out all truth by the science of numbers. † Marcellinus, speaking of the conventual associations of the Druids, expresses himself as if he conceived that they so lived in obedience to the commands of Pythagoras; "as the authority of Pythagoras hath decreed," are his words. ‡ Others affirm that the Grecian philosopher derived his philosophy from the Druids. A report is preserved by Clement of Alexandria that Pythagoras, in the course of his travels, studied under both the Druids and the Brahmins. § The probability is that both Pythagoras and the Druids drew their philosophy from the same fountain.

Several of the ablest and most laborious among the modern investigators of the subject of Druidism have found themselves compelled to adopt the theory of its Oriental origin. Pelloutier, from the numerous and strong resemblances presented by the Druidical and the old Persian religion, concludes the Celts and Persians, as Mr. O'Brien has lately done, to be the same people, and the Celtic tongue to be the ancient Persic. ‖ The late Mr. Reuben Burrow, distinguished for his intimate acquaintance with the Indian astronomy and mythology, in a paper in the Asiatic Researches, decidedly pronounces the Druids to have been a race of emigrated Indian philosophers, and Stonehenge to be evidently one of the Temples of Budha. ¶ It may be recollected that some of the Welsh antiquaries have, on other grounds, brought their assumed British ancestors from Ceylon, the great seat of Budhism. ** The same origin is also assigned by Mr. O'Brien to the primitive religion and civilization of Ireland. This question has been examined at great length in a "Dissertation on the Origin of the Druids," by Mr. Maurice, who, considering the

Budhists to have been a sect of the Brahmins, comes to the conclusion that "the celebrated order of the Druids, anciently established in this country, were the immediate descendants of a tribe of Brahmins situated in the high northern latitudes bordering on the vast range of Caucasus; that these, during a period of the Indian empire, when its limits were most extended in Asia, mingling with the Celto-Scythian tribes, who tenanted the immense deserts of Grand Tartary, became gradually incorporated, though not confounded with that ancient nation; introduced among them the rites of the Brahmin religion, occasionally adopting those of the Scythians, and together with them finally emigrated to the western regions of Europe." *

It must be confessed that the Druidical system, as established in Gaul and Britain, has altogether very much the appearance of something not the growth of the country, but superinduced upon the native barbarism by importation from abroad. The knowledge and arts of which they appear to have been possessed, seem to point out the Druids as of foreign extraction, and as continuing to form the depositories of a civilization greatly superior to that of the general community in the midst of which they dwelt. It was quite natural, however, that Druidism, supposing it to have been originally an imported and foreign religion, should nevertheless gradually adopt some things from the idolatry of a different form which may have prevailed in Britain and Gaul previous to its introduction; just as we find Christianity itself to have become adulterated in some countries by an infusion of the heathenism with which it was brought into contact. On this hypothesis we may perhaps best account for those apparent traces of the Druidical religion which are to be detected in some Celtic countries, where, at the same time, we have no reason to believe that there ever were any Druids. It has been contended that although there were no Druids anywhere except in Britain and Gaul, the Druidical religion extended over all the north and west of Europe.† It is probable that what have been taken for the doctrines or practices of Druidism in other Celtic countries, were really those of that elder native superstition from which pure Druidism eventually received some intermixture and corruption.

The Germans, Cæsar expressly tells us, had no Druids; nor is there a vestige of such an institution to be discovered in the ancient history, traditions, customs, or monuments of any Gothic people. It was probably indeed confined to Ireland, South Britain, and Gaul, until the measures taken to root it out from the Roman dominions seem to have compelled some of the Druids to take refuge in other countries. The emperor Tiberius, according to Pliny and Strabo, and the emperor Claudius, according to Suetonius, issued decrees for the total abolition of the Druidical religion, on the pretext of an abhorrence of the atrocity of the human sacrifices in which it indulged its votaries. The true motive may be suspected to have been a jealousy of the influence among the provincials of Gaul and Britain of a native order of priesthood so powerful as that of the Druids. Suetonius, indeed, states that the practice of the Druidical religion had been already interdicted to Roman citizens by Augustus. We have seen in the course of the preceding narrative how it was extirpated from its chief seat in the south of Britain by Suetonius Paulinus. Such of the Druids as survived this attack are supposed to have fled to the Isle of Man, which then became, in place of Anglesey, the head-quarters of British Druidism. It was probably after this that the Druidical religion penetrated to the northern parts of the island. The vestiges, at all events, of its establishment at some period in Scotland are spread over many parts of that country, and it has left its impression in various still surviving popular customs and superstitions. The number and variety of the Druid remains in North Britain, according to a late learned writer, are almost endless. The principal seat of Scottish Druidism is thought to have been the parish of Kirkmichael, in the recesses of Perthshire, near the great mountainous range of the Grampians. *

Druidism long survived, though in obscurity and decay, the thunder of the imperial edicts. In Ireland, indeed, where the Roman arms had not penetrated, it continued to flourish down nearly to the middle of the fifth century, when it fell before the Christian enthusiasm and energy of St. Patrick. But even in Britain the practice of the Druidical worship appears to have subsisted among the people long after the Druids, as an order of priesthood, were extinct. The annals of the sixth, seventh, and even of the eighth century, contain numerous edicts of emperors, and canons of councils, against the worship of the sun, the moon, mountains, rivers, lakes, and trees. † There is even a law to the same effect of the English king Canute, in the eleventh century. Nor, as we have already more than once had occasion to remark, have some of the practices of the old superstition yet altogether ceased to be remembered in our popular sports, pastimes, and anniversary usages. The ceremonies of All-Hallowmass, the bonfires of May-day and Midsummer eve, the virtues attributed to the mistletoe, and various other customs of the villages and country parts of England, Scotland, and Ireland, still speak to us of the days of Druidism, and evince that the impression of its grim ritual has not been wholly obliterated from the popular imagination, by the lapse of nearly twenty centuries.

On the settlement of the Romans in Britain, the established religion of the province of course became the same classic superstition which these conquerors of the world still maintained in all its ancient honours and pre-eminence in their native Italy, which was diffused alike through all the

† Pelloutier Hist. des Celtes, iii. 4.

customs of their private life and the whole system of their state economy, and which they carried with them, almost as a part of themselves, or at least as the very living spirit and sustaining power of their entire polity and civilization, into every foreign land that they colonized. In this far island, too, as in the elder homes of poetry and the arts,

> "An age hath been when Earth was proud
> Of lustre too intense
> To be sustained: and mortals bowed
> The front in self-defence."

Beside the rude grandeur of Stonehenge, and surrounded by the gloom of the sacred groves, glittering temples, displaying all the grace and pomp of finished architecture, now rose to Jupiter, and Apollo, and Diana, and Venus; and the air of our northern clime was peopled with all the bright dreams and visions of the mythology of Greece. A temple of Minerva, and probably other sacred edifices, appear to have adorned the city of Bath: London is supposed to have had its temple of Diana, occupying the same natural elevation which is now crowned by the magnificent Cathedral of St. Paul's; and the foundations and other remains of similar monuments of the Roman Paganism have been discovered in many of our other ancient towns. But perhaps no such material memorials are so well fitted to strike the imagination, and to convey a lively impression of this long past state of things, as the passage in the Annals of Tacitus in which we find a string of prodigies recounted to have happened in different parts of the province of Britain immediately before the insurrection of Boadicea, just as the same events might have taken place in Italy or in Rome itself. First, in the town of Camalodunum, the image of the goddess Victory, without any apparent cause, suddenly falls from its place, and turns its face round, as if giving way to the enemy. Then, females, seized with a sort of prophetic fury, would be heard mournfully calling out that destruction was at hand, their cries penetrating from the streets both into the *curia*, or council-chamber, and into the theatre. A representation, in the air, of the colony laid in ruins was seen near the mouth of the Thames, while the sea assumed the colour of blood, and the receding tide seemed to leave behind it the phantoms of human carcases. The picture is completed by the mention of the temple in which the Roman soldiery took refuge on the rushing into the city of their infuriated assailants,—of the undefended state of the place, in which the elegance of the buildings had been more attended to than their strength,—of another temple which had been raised in it to Claudius the Divine,—and, finally, of its crew of rapacious priests who, under the pretence of religion, wasted every man's substance, and excited a deeper indignation in the breasts of the unhappy natives than all the other cruelties and oppressions to which they were subjected.

Three views, copied from Horsley's Britannia Romana, of a splendid bronze bowl, or patera, found in Wiltshire, and supposed to have been used for the joint libation of the chief magistrates of the five Roman towns, whose names appear on its margin.

SECTION II.

INTRODUCTION OF CHRISTIANITY.

ANOTHER result, however, of the Roman invasion of Britain was the introduction into the island of the Christian faith. An event so important might be expected to hold a prominent place in our early chronicles. The missionary by whom Christianity was first brought to this island, the manner in which it was impressed upon the belief of so primitive a people, and the persons by whom its profession was earliest adopted, are particulars which it would have been interesting and gratifying to find recorded. But from the obscurity that pervades the ecclesiastical records of the first century, and the unobtrusive silence with which the commencing steps of the Christian faith were made, it cannot be accounted strange if Britain, a country at that time so remote and insignificant, should have the beginning of her religious history involved in much obscurity.

The investigations of the curious however have, partly by bold conjectures and partly from monkish legends, attempted to show how Britain either was, or might have been, Christianized. Some have attributed the work to St. Peter, some to James the son of Zebedee, and others to Simon Zelotes; but for so important an office as the apostleship of this island the majority of writers will be contented with no less a personage than St. Paul; and they ground their assumption upon the fact that several of the most active years of his life are not accounted for in the Acts of the Apostles. They think that therefore some part at least of this interval must have been employed among the Britons. By others again, such inferior personages as Aristobulus, who is incidentally mentioned by St. Paul,* Joseph of Arimathea, and the disciples of Polycarp, have been honoured as the founders of Christianity in Britain. Some of these accounts would imply that British Christianity is as old as the apostolic age; and, although this point too must be considered as very uncertain, a few slight collateral facts have been adduced as affording evidence that the island contained some converts at that early date. Thus, about the middle of the first century, we find Pomponia Græcina, a British lady, and wife of the Proconsul Plautius, accused of being devoted to a strange and gloomy superstition, by which it has been thought, not improbably, that Christianity is implied;† and Claudia, the wife of Pudens the senator, a British lady eulogised by Martial,‡ is supposed by some to have been the person of the same name mentioned by St. Paul.§

All that can be regarded as well established is, that at a comparatively early period Christianity found its way into the British islands. Even before the close of the first century, not only Christian refugees may have fled thither from the continent to escape persecution, but Christian soldiers and civilians may have accompanied the invading armies. The path thus opened, and the work commenced, successive missionaries, from the operation of the same causes, would follow, to extend the sphere of action and increase the number of the converts. Circumstances, too, were peculiarly favourable in Britain for such a successful progress. The preceding subtle and influential priesthood of Druidism, who might have the most effectually opposed the new faith, had been early destroyed by the swords of the conquerors, and the latter were too intent upon achieving the complete subjection of the country, to concern themselves about the transition of the inhabitants from one system of religious opinions to another. In this manner it would appear that Christian communities were gradually formed, buildings set apart for the purposes of public worship, and an ecclesiastical government established. But the same obscurity that pervades the origin of Christianity in Britain, extends over the whole of its early progress. Unfortunately, those monastic writers who attempted to compile its history were more eager to discover miracles than facts. Even of the venerable Bede, it must be admitted that his credulity appears to have been, at least, equal to his honesty. The favourite legend with which these writers decorate their history of the first centuries of the British church is that of king Lucius, the son of Coilus. According to their account, Lucius was king of the whole island, and, having consented to be baptized at the instance of the Roman emperor, he became so earnest for the conversion of his people that he sent to Eleutherius, bishop of Rome, for assistance in the important work. In consequence of this application several learned doctors were sent, by whose instrumentality paganism was abolished throughout the island, and Christianity established in its room. They add, moreover, that three archbishops and twenty-eight bishops were established, for the government of the British church, upon the ruins of the pagan hierarchy; and that to them were made over, not only the revenues of the former priesthood, but also large additional means of support. Not to waste a moment in pointing out such impossibilities as a king of the whole island at this time, or a heathen emperor labouring for his conversion in concert with a Roman bishop, we see, dimly shadowed forth in this monkish legend, some petty British king or chieftain, in vassalage to Rome, who, with the aid of Roman missionaries, effected the conversion of his tribe. A passing allusion, in the writings of Tertullian, gives us a more distinct idea of the state of Christianity in Britain than can be obtained from any such narratives as this. In his work against the Jews, written A.D. 209, he says that "even those places in Britain hitherto inaccessible to the Roman arms have been subdued by the gospel of Christ." From this sentence we may form a conjecture as to the extent to which the new religion had spread even at this early period. It must have been planted for a considerable time in the South, and obtained a material ascendancy before it could have penetrated beyond the northern boundary of the pro-

* Romans, xvi. 10. † Tac. Annal. xiii. 32.
‡ Epigram, xi. 53. § 2 Timothy, iv. 21.

vince. We cannot suppose, however, that in circumstances so much more unfavourable it could make much progress in these barbarous regions. The wild tribes of Scotland, still unconquered, were also disunited, or employed in mutual hostility; and the native priesthood possessed an influence that would materially impede the success of the new faith. We discover accordingly that, at a much later period, Kentigern and Columba found the Scots and Picts still heathens. The expressions of Tertullian, however, may very possibly refer to the extension of Christianity, not so much to Scotland, as to Ireland, in which latter part of Britain, for so it was then accounted, there are other reasons for supposing that this religion reckoned some converts even at that early period.

As yet, the remoteness of Britain, and the suppression of the Druids, had equally preserved its humble church from foreign and domestic persecution; but the time arrived when it was to share in those afflictions which fell to the lot of the Christian world at large. Diocletian, inspired with hatred and jealousy at the predominance of doctrines which were supposed to menace all civil authority, addressed himself to the entire destruction of Christianity; and edicts were published in every part of the empire for the suppression of its rites, and the persecution of its followers. In a storm so universal Britain was no longer overlooked; and St. Alban, the first martyr of our island, perished, with many others whose names have not been recorded. This event, according to Bede, took place in the year 286; but if it really happened in the great persecution under Diocletian, a date at least seventeen or eighteen years later must be assigned to it. Although Constantius, who at this time directed the affairs of Britain, was favourably inclined towards the Christians, he durst not oppose the imperial mandate; and however he might indirectly alleviate its severities, yet the inferior magistrates had no such scruples. One incident at this time betrayed his friendly disposition towards the persecuted. Assembling the officers of his household, he announced to them the pleasure of the emperor, requiring the dismission of the Christians from office, and gave those who were of that religion their choice either to renounce their creed or resign their situations. Some of them, unwilling to make the required sacrifice, abjured their faith; upon which Constantius discharged them from his service; declaring that those who had renounced their God could never prove true to a master.* This persecution continued to rage in Britain, according to Gildas, for the space of two years, during which numbers of the Christian churches were destroyed, and multitudes who escaped from death were obliged to fly to the forests and mountains. But at last Diocletian, having laid down the purple, and compelled his colleague Maximian at the same time to abdicate, a persecution that had been conducted upon a more regular system than any that had preceded it, and had almost extinguished the Christian faith, subsided as suddenly as it had commenced, and the British church was restored to its former tranquillity.

* Euseb. Vit. Constant, i. 16.

Of the history of Christianity in our island during the third century we know little or nothing; those subtle or incomprehensible religious disputes which agitated the churches of the East and West appear to have been of too refined a character for the simple understandings of the Britons; and by these we may perhaps assume, from the silence of history, that they remained nearly unmolested. From the time of the accession of Constantine, however, in the beginning of the fourth century, the hitherto secluded church of Britain seems to have become united to the civilized world, and to have been considered as making a part of the spiritual empire which he established. In the year 314, Eborius, bishop of York, Restitutus, bishop of London, and Adelphius, bishop of Richborough, attended the council at Arles; and as three bishops formed the full representation of a province, it appears that Britain was thus placed on an equality with the churches of Spain and Gaul. The liberality of Constantine gave opportunities to the ecclesiastics of acquiring wealth and distinction, of which many were eager to avail themselves; but while, in Italy and the East, they gradually began to rival the pomp of temporal princes, nothing of this kind was exhibited in Britain. In fact, we are rather justified in the conclusion that the British bishops had hitherto been, and still continued poor, on account not only of the national poverty, but of the partial conversion of the people, many of whom still remained attached either to the classical or druidical worship. This view is corroborated by a circumstance that occurred in the succeeding reign. When Constantius offered to maintain the bishops of the West from the royal revenues, only those of Britain acceded to the proposal, while the rest rejected it. This would seem to imply that the British bishops must have been but indifferently provided for from other sources.

It has generally been supposed that, during the fourth century, the British church was considerably tainted with those corruptions in doctrine that so largely overspread the continental churches; and that Arianism, so triumphant in the West, extensively prevailed in our island: and in proof of this Gildas is quoted, who describes the progress of that heresy among his countrymen with many mournful amplifications. In opposition to the statement of Gildas, St. Jerome and St. Chrysostom frequently allude, in their writings, to the orthodoxy of the British church. This contradiction may perhaps be reconciled by the supposition that while these fathers regarded merely the national creed, the historian described the private interpretation of its doctrines which may have been cherished by certain ecclesiastics.

It must be acknowledged that, during this century, the bishops of Britain, if we may believe the account of Facundus,* exhibited in one instance

* Facund. v. 30. Du Pin. Hist. Cent. iv.

but a weak and compromising spirit. At the council of Ariminum, summoned by Constantius, in the year 359, they are asserted to have allowed themselves to be influenced so much by the persuasions or threats of the emperor, as to subscribe to sentiments in favour of Arianism; but, upon their return to Britain, they hastened to retract these concessions, and renew their allegiance to the Nicean creed. These circumstances would seem to show, that though the doctrines of Arius may have been partially cherished, yet they were unpopular, and that the body of the church remained comparatively orthodox and undivided. The only ostensible difference by which the British church was distinguished, during this period, from the churches on the continent, was, its observing the Asiatic computation of time, in keeping Easter, instead of the Roman—a distinction frivolous in itself, but important in its consequences at a later period, when the Roman pontiffs laid claim to universal rule, and sought to secure it by enforcing a universal conformity.

After the Christian church had been established in power and splendour, the same results were exhibited in Britain as in other countries; and while the Italian and Greek infused into the Christian faith the classical Paganism of his fathers, the Briton leavened it with his ancestral Druidical superstitions.* To these also were added the religious follies that were now of general prevalence. Pilgrimages to the Holy Land became fashionable, and were performed by numerous devotees. The orders of monks also became more numerous, though they were obliged, from the poverty of the country, to procure their subsistence by manual labour.

In the fifth century, the opinions of Pelagius, most probably a native of Ireland, were zealously disseminated through the British islands, by his disciples and countrymen, Agricola and Celestius; and we are told by Bede, that, alarmed at the rapid progress of these doctrines, but unable to refute them, the British ecclesiastics implored assistance from the bishops of Gaul. The latter sent Germanus, bishop of Auxerre, and Lupus, bishop of Troyes, to their aid, who arrived in Britain about the year 429. After having been welcomed by the orthodox clergy, they appointed a meeting for public disputation with the Pelagians. The latter, according to the narrative of the venerable historian, came to the arena in great pomp, and advocated their cause with the most showy rhetoric; but Germanus and Lupus, when it was their turn to reply, so overwhelmed them with arguments and authorities, that they were completely silenced, and the whole assembly triumphed in their discomfiture. Bede was too orthodox and too credulous to have doubted the tradition, if it had affirmed that the arguments of the Gallic bishops on this occasion struck their antagonists dead as well as dumb.

But these bishops were skilled in the handling of other weapons as well as those of controversy. We have already related how the military force of the South Britons, being led on by Germanus against the Scots and Picts, put the barbarians to flight with shouts of "Hallelujah." Having thus conquered the temporal as well as the spiritual enemies of Britain, the bishops departed. In a short time, however, the narrative proceeds, the baffled Pelagians again raised their heads, and their cause became more triumphant than before. A fresh application was in consequence made to the victorious Germanus, the British bishops having, as it would seem, profited little by the arguments with which he had formerly defended their cause. He returned in 446, accompanied by Severus, bishop of Treves; and this time, not contented with merely silencing the Pelagians for the moment, he procured the banishment of their leaders from the island; and thus peace and order were restored for the short interval that preceded the arrival of the Saxons. It would appear, therefore, that, equally disunited and helpless, the church and the state were at this period both obliged to invoke aid against their domestic adversaries. Bede has garnished the whole of this detail with many miraculous circumstances, which we have not considered it necessary to retain.

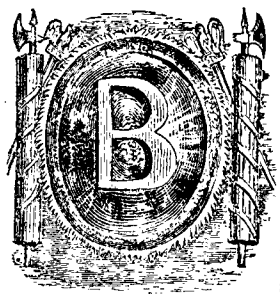
* Southey's Book of the Church, i. 16.

CHAPTER III.

HISTORY OF THE CONSTITUTION, GOVERNMENT, AND LAWS.

Section I.

POLITICAL DIVISIONS OF THE BRITISH NATIONS.



EFORE proceeding to the sketch which the brief notices of the ancient writers enable us to give of the form of government that appears to have prevailed in Britain before the Roman Conquest, it will be convenient to take a rapid survey of the manner in which the country was divided among the several nations or tribes that inhabited it. These tribes were not only distinguished by different names, and by the occupation of separate territories, but they were to a certain extent so many different races, which had come to the island from various districts of the opposite continent, and still continued to preserve themselves as unmixed with each other as they were in their original seats. Thus Cæsar tells us that the several bodies of Belgians which he found settled on the sea-coast, although they had united to wrest the tract of which they were in possession from the previous inhabitants, had almost all retained the distinguishing names of their mother states; and the same thing no doubt had been done in most instances by the earlier settlers from Gaul and elsewhere.

We derive all the direct information we possess respecting the ancient British nations partly from Cæsar, Tacitus, Dio Cassius, and the other authors who have given us details of the military operations of the Romans in the island, and partly from certain professedly geographical accounts of it. One of these is that contained in the great geographical compilation of the celebrated Ptolemy of Alexandria, who wrote in the early part of the second century, but who, as we have already observed, is believed to have drawn the materials for much of his work, and for the portion of it relating to the British islands in particular, from sources of considerably greater antiquity. We may probably regard his description, therefore, as, in part at least, applicable to the country rather before Cæsar's invasion than after the Roman conquest; in other words, rather as it was known to the Phœnicians than to the Romans. It is evident, however, that Ptolemy must have made a good many additions to his original Tyrian authorities from later accounts. Another detailed description of Britain is that contained in what is called the Itinerary of Antoninus, a most valuable survey of all the roads throughout the Roman empire, evidently drawn up by public authority, and the last additions to which do not appear to have been made later than the beginning of the fourth century, while its original compilation has been ascribed, on probable grounds, to the time of Julius Cæsar. It presents us with a view of the high roads and chief towns of South Britain during the most flourishing period of the Roman occupation. Another ancient account of Roman Britain of undoubted authenticity is that found in the work entitled "Notitia Imperii," which is an enumeration of the civil and military establishments of all the provinces of the empire, brought down, according to the title, to beyond the times of Arcadius and Honorius. In the case of Britain, the Notitia may be understood to give us the imperial establishment at the latest date at which the island formed a part of the Roman empire. It has preserved the names (though unfortunately merely the names) of the several provinces into which Roman Britain was divided, and of the several military stations. Lastly, there is a remarkable performance, professing to be a geographical account of Britain in the time of the Romans, drawn up from the papers of a Roman general, by a Benedictine monk of the fourteenth century named Richard of Cirencester. Of the existence of Richard of Cirencester there is no doubt; we have other works from his pen, of which some have been printed, and others remain in manuscript. It may also be admitted, that if he really wrote the present work, he did not, in its composition, draw upon his own learning or ingenuity, which appear to have been quite unequal to such an achievement, but transcribed what he has set down from some other document. The only reasonable doubt is, whether the work be not altogether a modern forgery. It was never heard of till the year 1757, when the discovery of the manuscript was announced by Mr. C. Bertram, Professor of the English Language in the University of Copenhagen, and a copy of it transmitted to this country to Dr. Stukely, by whom an extract, containing the most material part of the work, was immediately printed. The whole was published the same year at Copenhagen by Mr. Bertram. The original manuscript, however, we believe, has never since been seen, and no trace of it was to be found among Mr. Bertram's papers after his death. On the other hand, the

internal evidence has appeared to many persons to be in favour of the authenticity of the work; and it has been very generally received as an important contribution to our knowledge of ancient Britain. Richard of Cirencester's description, which is accompanied by a rudely-drawn map, contains much information, if we could be assured of its trustworthiness, especially respecting the geography of the northern part of the island, which is not to be found either in Ptolemy or the Itinerary.

Cæsar, in his two descents upon Britain, saw no more than a corner of the country. The farthest point to which he penetrated was the capital of Cassivellaunus, which is generally supposed to have stood on the site of the now ruined town of Verulam in the vicinity of St. Alban's, in Hertfordshire. Cæsar himself describes the dominions of this prince as lying along the north bank of the Thames, at the distance of about eighty miles from the sea, by which he probably means the east coast of Kent, from which he began his march. Unfortunately we are nowhere told of what people Cassivellaunus was king. The only British nations mentioned by Cæsar are the people of Cantium, the Trinobantes, the Cenimagni, the Segontiaci, the Ancalites, the Bibroci, and the Cassi. All these must have dwelt in the part of the country which he hastily overran. Cantium was undoubtedly Kent, so called from a Celtic word signifying a head or promontory. The Saxons, it has been observed,* called Kent Cantirland, whence our present Canterbury; and we may therefore conjecture that the original name of the district was Cean-tir, that is, the head or protruding part of the land, the same word with Cantire, the name still borne by the long peninsular tract which forms the south-western extremity of Argyleshire. "Vanguard of Liberty!" exclaims a modern poet,

> "Ye men of Kent,
> Ye children of a soil that doth advance
> Its haughty brow against the coast of France!"

Ptolemy, it may be noted, sets down London, or as he writes the name, Londinium, as one of the towns of the Cantii; and from this it has been conjectured, with much probability, that the original London stood on the south side of the Thames. Cæsar mentions no such place; but indeed he has not recorded the name of a single British town. The Trinobantes, called by Ptolemy the Trinoantes, occupied Essex, and, probably, the greater part of Middlesex. London on the north bank of the Thames, therefore, the proper foundation of the present British metropolis, was one of their towns. Geoffrey of Monmouth's story, however, about that people having derived their name from Trinovant, that is, New Troy, the original name of London, cannot be received. Trinobantes is said to mean, in Celtic, a powerful people.†

Of the other tribes mentioned by Cæsar none are noticed, at least under the same names, by any other authority except Richard of Cirencester. He enumerates the Bibroci, the Segontiaci, and the Cassi, whom he calls the Cassii. The Bibroci are commonly supposed to have been the inhabitants of Berkshire, and to have left their name to that county; the Segontiaci of Hampshire; and the Cassi of Hertford, one of the hundreds of which, that in which St. Alban's stands, still retains the name of Cassio. The Cassi would therefore appear to have been the subjects of Cassivellaunus, if Verulam was his capital; but this supposition, it must be admitted, does not appear to be very consistent with the narrative of Cæsar, in which the Cassi are stated to have made their submission along with other tribes, while Cassivellaunus still held out. The Cenimagni have been supposed to be the same with the Iceni mentioned by Richard and also by Tacitus, and with the Semini of Ptolemy, who appear to have inhabited the shires of Norfolk, Suffolk, and Cambridge; and the Ancalides with the Atrebatii of Ptolemy and the Attrebates of Richard, whose residence is placed in Wiltshire. If this latter notion be well founded, it is probable that the name, which only occurs once in Cæsar, has not come down to us as he wrote it; for he was well acquainted with the Atrebates of Belgic Gaul (the ancient occupants of the territory of Artois), of whom this British people are supposed to have been a colony, and could not have mistaken the name when it met him again here. On the whole, it must be confessed that nothing can be more unsatisfactory than these attempted identifications of the tribes of whom Cæsar speaks. We should be inclined to think that they were not spread over nearly so great an extent of territory as they are by this account made to occupy. All of them, except the Cantii, who are not recorded to have submitted, would almost appear, from the manner in which they are mentioned, to have been merely dependent upon the Trinobantes, whose policy in making terms with the Roman general they are stated instantly to have followed, and that is really all that is said of them. We do not believe that any of them ever formed part of the confederation organized to oppose the invasion, at the head of which Cassivellaunus was.

According to Ptolemy, who, after all, is the only authority upon whom much dependence can be placed, the space over which the tribes mentioned by Cæsar, and by no other writer, if we cast aside the very suspicious authority of Richard of Cirencester, have been commonly diffused, appears to have been fully occupied by other tribes. The following is the order in which he enumerates the several nations inhabiting what we now call South Britain, with the manner in which he appears to distribute the country among them.

1. The BRIGANTES. Their territory is described as extending across the island from sea to sea, and it appears to have comprehended the greater part of the modern counties of Durham, York, Cumberland, Westmoreland, and Lancashire. The Brigantes were considered the most powerful of the British nations. Among their towns mentioned by Ptolemy are Eboracum, now York, and Isurium, now Aldborough, reduced to a small vil-

* Betham's Gael and Cymri. † Betham.

lage, though it retained till lately the right of sending a member to parliament, an evidence of its importance even in comparatively modern times.

2. The Parisi are stated to have been adjacent to the Brigantes, and about the well-havened bay. They are thought to have occupied the south-eastern angle of Yorkshire, now called Holderness, lying along the coast of Bridlington or Burlington Bay.

3. The Ordovices dwelt to the south of the Brigantes and the Parisi, in the most westerly part of the island. They appear to have been the inhabitants of North Wales.

4. The Cornavii were east from these last, and seem to have occupied Cheshire, Shropshire, Stafford, Worcester, and Warwick. Their towns mentioned by Ptolemy are Deuna, now Chester, and Uiroconium, supposed to be Wroxeter, near Shrewsbury.

5. The Coritani are described as adjacent to the Cornavii. They probably occupied the whole of the space intervening between the Cornavii and the east coast, comprehending the modern counties of Derby, Nottingham, Lincoln, Leicester, Rutland, and part of Northampton. Their chief towns were Lindum, now Lincoln, and Rhage, now Leicester.

6. The Catyeuchlani (or Catuellani, as they are called by Dio Cassius) come next in the list. They are conjectured to have occupied the remainder of Northampton, and all Buckingham, Bedford, Hertford, and Huntingdon. To these we should be inclined to add the south-western portion of Oxfordshire, lying along the Thames. One of their towns mentioned by Ptolemy is Urolanium, universally admitted to be Verulam, near St. Alban's. It does not necessarily follow, however, that this was the capital of Cassivellaunus, although it is perhaps most probable that this prince was really the chief of the Catyeuchlani.

7. The Simeni are described as adjacent to these last, and are supposed to have occupied Norfolk, Suffolk, and Cambridge. They are conjectured, as has been already stated, to be the same with the Iceni, of whom mention is made by Tacitus. Ptolemy assigns to them only one town, and to that he gives the name of Uenta or Venta, which appears to have been a common British name for the capital of a state. The Venta of the Simeni or Iceni is supposed to have been at Caister, near Norwich.

8. The Trinoantes (or Trinobantes, as they are called by Cæsar and Tacitus), the next nation mentioned, are placed more to the eastward than the Simeni; and this may suggest a doubt as to these last being really the same with the Iceni, who appear, from the Itinerary, to have certainly inhabited Norfolk. Probably, however, Ptolemy erroneously supposed the coast of Essex to stretch farther to the east that that of Norfolk and Suffolk. He places Camulodanum, the capital of the Trinoantes, half a degree to the east of the Venta of the Simeni. Camulodanum, or, as it is called in the Itinerary, Camoludunum, is generally supposed to be Maldon, though some place it at Colchester. There can be no doubt as to Essex being the district, or part of the district, assigned by Ptolemy to the Trinoantes, since he settles them beside the estuary Iamensa, or, as the word is found written in another place, Iamissa, evidently a transcriber's corruption of Tamissa, the Thames.

9. The Demetæ follow next in the enumeration, being described as dwelling to the south of the tribes already mentioned, and in the extreme western part of the island. They seem to have occupied the three south Welsh counties of Caermarthen, Cardigan, and Pembroke. One of their towns, Maridunum, is believed to be the present Caermarthen.

10. The Silures were to the east of these, occupying, it is supposed, the modern counties of Radnor, Brecknock, Glamorgan, Hereford, and Monmouth. Ptolemy makes no mention of two important towns which were certainly situated in the territory of the Silures, namely the Venta Silurum, now Caerwent, and Isca Silurum, now Caerleon, both in Monmouthshire.

11. The Dobuni (probably the same who are called by Dio Cassius the Boduni) are described as next to the Silures, and probably inhabited Gloucestershire with the greater part of Oxfordshire. Their chief town, Corinium, appears to be the present Cirencester.

12. The Atrebatii follow in the enumeration. They are thought, though the point is disputed, to have been the occupants of Berkshire. As they were, if we may trust to their name, a Belgic people, it is more probable that they were seated to the south than to the north of the Thames; and the order in which they are enumerated by Ptolemy —among the nations to the south of the Catyeuchlani and the Trinobantes—appears also clearly to indicate the former position.

13. The Cantii are described as adjacent to the Atrebatii, and as extending to the eastern coast of the island. These two states, therefore, probably met somewhere in the north part of Surrey. Besides Londinium, Ptolemy mentions Daruenum (believed to be Canterbury) and Rutupiæ, the Rutupæ of the Itinerary (probably Richborough, near Sandwich), as towns of the Cantii.

14. The Regni are next mentioned, and are stated to lie to the south of the Atrebatii and the Cantii. They therefore occupied Surrey, Sussex, and probably the greater part of Hampshire.

15. The Belgæ are described as situated to the south of the Dobuni, and are supposed to have possessed the eastern part of Somerset, Wilts, and the western part of Hampshire. Their towns were Venta Belgarum, generally believed to be Winchester; Ischalis, probably Ilchester; and the Hot Springs (in Latin, Aquæ Calidæ), undoubtedly Bath.

16. The Durotriges are described as south-west from the Belgæ. Their seat was the present Dorsetshire, which still preserves their name, sig-

nifying in the Celtic the dwellers by the water. Their town Dunium is supposed to be the present Dorchester.

17. The DUMNONII (or Damnonii, as they are called in the Itinerary) close the list, and are described as occupying the western extremity of the island. They were the inhabitants of Devon, Cornwall, and the west of Somerset; their name Dumn, or, as it would be in Celtic, Duvn, probably still subsisting in the modern Devon. Their capital was Isca Dumnoniorum, supposed to be the present Exeter.

Of course, although we have thus indicated the localities of the several tribes by the names of our present counties, it is not to be understood that the ancient boundaries were the same as those of these comparatively modern divisions. But to ascertain the precise line by which each territory was separated from those adjacent to it, is now in most instances utterly impossible. All that can be attempted is, to determine, generally, the part of the country in which each lay. In a good many cases the evidence of inscriptions and of other remains has confirmed Ptolemy's account; and, making allowance for a very corrupt text, it may be affirmed that his distribution of the several ancient British states has not been proved to be erroneous in any material respect by the discoveries of this kind that have from time to time been made. We do not believe that a view of the ancient geography, at least of the southern part of the island, on the whole, so complete, so distinct, and so accordant at once with the testimony of history and of monuments, as that which he has given us, is to be obtained from any other source, or from all other existing sources of information combined. The tribes mentioned by Richard of Cirencester, in addition to those enumerated by Ptolemy, within the space we have now been surveying, are, the Segontiaci, Ancalites, Bibroci, and Cassii (as already noticed), the Hedui in Somersetshire, the Cimbri in Devonshire, the Volantii and Sistuntii in Lancashire, and the Rhemi in Surrey and Sussex; but these last are probably intended to be considered the same people with the Regni of Ptolemy. Richard's list also includes the Cangiani, supposed to be the same with the Cangi mentioned by Tacitus, and with the Cangani of Dio. These, however, do not appear to have been a distinct nation, but to have been those of the youth of each tribe, or at least of many of the tribes, who were employed as the keepers of the flocks and herds.* Richard fixes them in Caernarvonshire, a location which by no means helps to make the passages in which they are mentioned by the ancient historians more intelligible.

Ptolemy's description of North Britain is, in various respects, not so satisfactory as that which he has given of the southern portion of the island. In particular, his account is rendered obscure and confused by a strange mistake, into which he has fallen, as to the direction of the land, which he extends, not towards the north, but towards the east. In other words, he gives as differences of longitude what he ought to have given as differences of latitude. His enumeration of the northern tribes may also be safely presumed to be more imperfect than that which he gives of those in the south.

18. The NOVANTÆ are the first people he mentions. He describes them as dwelling on the north coast of the island (by which, we must understand the west), immediately under the peninsula of the same name. The peninsula or promontory of the Novantæ is admitted, on all hands, to be what is now called the Mull of Galloway; and the Novantæ are considered to have occupied the county of Wigton, the western half of Kirkcudbright, and the southern extremity of Ayrshire, their boundaries probably being the Irish Sea, the Solway Frith, the river Dee, and the hills dividing the districts now called Galloway and Carrick. One of their towns was Loucopibia, supposed to be the present Whithorn.

19. The SELGOVÆ are described as under, or south (meaning east), from the Novantæ, and appear to have occupied the eastern half of Kirkcudbright and the greater part of Dumfriesshire. They are supposed to have given its present name to the Solway, along which their territory extended, or to have received theirs from it. The Solway is called by Ptolemy the Ituna, probably from the Eden, which falls into that estuary.

20. The DAMNII lay north from these, and would seem to have extended over the shires of Ayr, Lanark, Renfrew, and Stirling, a corner of that of Dumbarton, and a small part of that of Perth. Among their towns were Vanduara, believed to be Paisley, and Lindum, which has been generally supposed to be Linlithgow, but which Chalmers places at Ardoch, in Perthshire, where there is a famous Roman camp. The wall of Antoninus passed through the territory of the Damnii.

21. The GADENI, of whom all that Ptolemy says is, that they were situated more to the north. This cannot, however, mean more to the north than the Damnii last mentioned, who, as we have seen, were placed along the sea coast of what Ptolemy understands to be the north side of the island. The meaning must be more to the north than the Otadeni, who are next mentioned, and are by a corresponding epithet, described as more to the south. With the notion which Ptolemy had of the shape of the island, this would place the Gadeni along a tract in the interior, which might extend from the Tyne to the Forth, embracing the north of Cumberland, the west of Northumberland, the west of Roxburgh, together with the counties of Selkirk, Peebles, west Lothian, and the greater part of Midlothian. There is no pretence, on a fair interpretation of Ptolemy's words, for saying, as has been done by some of the supporters of the authority of Richard of Cirencester,* that he places the Gadeni on the north of the Damnii beyond the Clyde, contrary to the evidence of inscriptions. In

* Baxter Gloss. Brit.

* Chalmers's Caledonia.

his geography the sea only was to the north of the Damnii. The town of Jedburgh and the river Jed, on which it stands, in Roxburghshire, seem still to preserve the name of the Gadeni.

22. The Otadeni, lying to the south of this tract in Ptolemy's notion, in reality to the south-east of it, would occupy the space intervening between it and the sea coast, comprehending the remainder of Northumberland and Roxburgh, and the whole of Berwick and East Lothian.

23. The Epidii lay east (that is, north) from the Damnii, but more northerly (that is, westerly), stretching eastwards (that is, northwards), from the promontory Epidium. The promontory in question is undoubtedly the peninsula of Cantyre, and the Epidii, therefore, were the inhabitants of this district, and of nearly all the rest of Argyleshire from the Frith of Clyde on the east to Loch Linne on the west.

24. The Cerones were next to the Epidii, and are supposed to have inhabited the part of Argyleshire to the west of Loch Linne, and the continuation of the same tract forming the western half of Inverness.

25. The Creones, who are described as lying to the east (that is, the north) of the Cerones, probably occupied nearly the whole of the present shire of Ross. But it may be doubted if the Cerones and the Creones were not the same people; in which case, their territory must have included the whole space we have assigned to the two.

26. The Carnonacæ came next, and would, therefore, occupy the west coast of Sutherland, including probably a small part of the north of Ross.

27. The Careni, who lay beyond them, may be supposed to have inhabited the north coast of Sutherland, and perhaps a small portion of Caithness. Richard of Cirencester, indeed, calls them the Catini, in which name it has been suggested we may find the origin of the present Caithness.

28. The Cornavii are described as lying to the east (that is, the north) of these, and as being the last people in that direction. They, therefore, occupied the north and east of Caithness. In their country were the three promontories, of the Tarvedrum, or Orcas, now Dunnet Head; the Virvedrum, now Duncansby Head; and the Virubium, now the Noss Head.

29. The Caledonii, properly so called, are the next people mentioned by Ptolemy; but the enumeration here starts from a new point, namely, from the Lelamnonian Bay on the west coast, which appears to be Loch Fyne. The Caledonii are described as extending from that bay across the country to the estuary of Varar, undoubtedly the Moray Frith, a river falling into the upper part of which still retains the ancient name. They, therefore, occupied the eastern portion of Inverness, with probably the adjoining parts of the shires of Argyle, Perth, and Ross. In the north-western part of this tract was the great Caledonian Forest.

30. The Cantæ were more to the east (that is, the north), and are supposed to have possessed the eastern angle of Ross-shire included between the Murray and the Dornoch Friths.

31. The Logi were between them and the Cornavii, and must, therefore, have occupied the south-east part of Sutherland, and probably a portion of the south of Caithness.

32. The Mertæ lay north (that is, north-west) from the Logi, which would place them in the central parts of Sutherland.

33. The Vacomagi are described as lying to the south (that is, the south-east) of the Caledonii, and appear to have occupied the counties of Nairn, Elgin, and Banff, with the west of Aberdeenshire, and perhaps a small portion of the east of Inverness.

34. The Venicontes are described as lying south from these last, to the west, and as, along with the Texali, they appear to have occupied the whole space between the tribes to the south of the Forth, the Caledonians, and the Vacomagi, we must assign to them the whole of the peninsula now forming the counties of Fife, Kinross, and Clackmannan, with a portion of the east and south-east of Perth, and probably also the counties of Forfar and Kincardine. Richard of Cirencester, however (who calls the Venicontes, Venricones) places the tribe of the Horestii (mentioned by Tacitus under the name of the Horesti), in the peninsula of Fife. All that appears with regard to the situation of the Horestii, from the narrative of Tacitus is, that they lay somewhere between the Grampian Hills and the previously conquered nations to the south of the Forth. It is probable enough that they may have been the inhabitants of Fife; but they may also very possibly have dwelt on the north side of the Frith of Tay. They seem to be included by Ptolemy under the name of the Venicontes.

35. The Texali are described as lying also to the south of the Vacomagi, and to the east, that is, the north-east, of the Venicontes. As Kinnaird's Head appears to have been called after them the promontory Taizalum (probably an error for Texalum, or Taixalum), and as, moreover, their chief town is designated Devana, and appears to have stood on the Diva (the modern Dee), either where Old Aberdeen now stands, or more probably on the spot occupied by Norman-Dykes, about six miles further from the sea, we can scarcely have any doubt that the present Aberdeenshire, with, perhaps, a part of Kincardine, formed the territory of the Texali.

Besides the Horestii, two other tribes, the Albani, or Damnii Albani, and the Attacotti, are mentioned by Richard of Cirencester, and not by Ptolemy. The Albani are placed in the mountainous region now forming the district of Breadalbane and Athol in the west of Perth, and south of Inverness-shire; but it is admitted that they had been subjugated by the Damnii, and that this region, therefore, might be considered as forming part of the territory of the latter. The Attacotti are mentioned by Ammianus Marcellinus; but it must be considered as very doubtful whether they were

a British or an Irish nation. A territory is found for them, on the authority of Richard, in the space between Loch Fyne and Loch Lomond, comprehending a portion of Argyle and the greater part of Dunbartonshire.

Another name mentioned by some later writers, and not occurring in Ptolemy, is that of the Mæatæ. This term, of the meaning of which different interpretations have been offered, appears to have been a collective name given to the tribes included between the wall of Antoninus Pius, which joined the Friths of Forth and Clyde, and that of Severus, extending from the Solway Frith to the mouth of the Tyne. These tribes were, the Novantæ, the Selgovæ, the Gadeni, the Otadeni, and, in part, the Damnii. In a loose way of speaking, the Mæatæ and the Caledonii seem to have come at length to be used as a general expression for all the tribes beyond the more limited Roman province: the Mæatæ being understood to mean the inhabitants of the comparatively level and open country; the Caledonii, those who dwelt among the woods and mountains of the north and west. From about the beginning of the fourth century, we begin to find the Caledonians and Mæatæ giving place to the new names of the Scots and Picts. A late writer has, from this and other considerations, inferred that the Picts were the same people with the Mæatæ;* but perhaps all that we are warranted in concluding is, that the same prominent place which the fierce Irish tribe of the Scots had now assumed among the mountaineers had been taken by the Picts among the lowlanders. The Picts, if not the descendants of the Mæatæ, appear certainly, at least, to have been their successors in the occupation of the same tract of country.

It may here be convenient very shortly to recapitulate the progress of the Roman arms as it affected the several British tribes that have just been enumerated. Tacitus, in his Life of Agricola, has sketched it very distinctly up to the commencement of the campaigns of that celebrated general. The efforts of Claudius and the two first governors, Aulus Plautius and Ostorius Scapula, had, by A.D. 50, either subdued by force or otherwise obtained the submission of all the nations included within the line of forts by which Ostorius may be said to have in some degree connected the opposite estuaries of the Wash and the Severn; namely, (taking them in the order of Ptolemy's enumeration,) the Catyeuchlani, the Iceni (supposing this people to be the same with the Semini), the Trinobantes, the Dobuni, the Atrebatii, the Cantii, the Regni, the Belgæ, the Durotriges, and the Dumnonii. Some of these, however, were not so completely reconciled to the yoke as not afterwards to make repeated attempts to regain their independence; and, in fact, it was not till about A.D. 64 or 65, under Petronius Tarpilianus, that the whole of this section of the island, now known by the name the Province, could be said to be brought into a state of entire subjection and tranquillity. Meanwhile, beyond the boundary of the Province, incursions had been made into the territories of the Brigantes in the north, and of the Silures, the Ordovices, and the people of Anglesey in the west; but no permanent impression had been made in those parts. It was not till the reign of Vespasian (A.D. 70—78) that the Brigantes were subdued by Petilius Cerealis, and the Silures by Julius Frontinus. Agricola assumed the government A.D. 78, and the same summer completely conquered the Ordovices and the island of Anglesey. In the course of the next three years he appears to have reduced to subjection all the nations to the south of the rampart which he constructed between the Friths of Forth and Clyde, with the exception only of those inhabiting the part of the west coast nearest to Ireland,—the Novantæ and the Selgovæ in all probability,—whom, however, he reduced in his next campaign. This was really the utmost extent to which the conquest of the country by the Romans was ever carried. Agricola, indeed, afterwards defeated the Caledonians in the famous battle fought at the foot of the Grampians; but it is not alleged that the victory was followed by any permanent results, or that even a single new tribe, the Horesti only excepted, made their submission for the moment. Certainly no establishments were ever attempted by the Romans beyond the Forth; nor were the conquests made by Agricola long maintained even up to that limit. Within twenty or thirty years after his time, we find the emperor Hadrian abandoning everything beyond the Solway. Antoninus Pius, indeed, soon after extended the province to its former boundary; but it was found impossible effectually to reduce the turbulent native occupants of the country between the two walls; and in the beginning of the second century, the attempt to hold it may be said to have been finally given up, first by the erection of the new barrier between the Solway and the Tyne by Severus, and, a few years afterwards, by the formal cession of the greater part of the disputed territory by Caracalla. After this, although the legions may have been sometimes found in conflict with the barbarians, perhaps, at a considerable distance beyond the wall of Severus, yet there seems to be no ground for believing that the Roman power ever renewed the attempt to gain a footing in these outer regions. The common hypothesis that, after this time, in the decline and rapidly accumulating difficulties of the empire, a new province, whether under the name of Valentia or of Flavia Cæsariensis, was formed in this part of the island, cannot be received upon the slight evidence that is brought forward in its support. At all events, if any such province was really established, as is assumed, in the latter part of the fourth century, it is quite impossible that the extension of the empire in that direction could have been more than nominal. When the northern tribes, on the final retirement of the imperial legions not many years after this, poured in upon the provincials, we hear of no obstruction whatever that they met with till they came to the wall of Severus.

* Lingard, History of England, i. 54.

Although the native British tribes, before their subjugation by the Romans, were so far from being united into one community that they were very generally at war one with another, yet there are circumstances which indicate that, to a certain extent, many of them felt themselves to have a common interest as the occupants of the same country. Even their intestine wars would of necessity often array them into opposing confederacies, and thus establish among them the habits and feelings of a mutual relationship and dependence. But it is not easy to form a judgment as to the range of territory over which, in such a state of society, any connexion, or even any communication, was kept up between the various tribes. Perhaps their intercourse with each other was carried on between points more remote from each other than we should be at first inclined to suppose. The nations to the south of the Thames and the Severn, or rather we ought probably to say of the Severn and the Wash, appear evidently to have been all accustomed to co-operate on emergencies, and to consider themselves as in some sort forming one society: although even when pressed by a common danger, their differences of origin may have afforded great facilities for fomenting divisions between those of Belgic descent, for instance, and the aborigines (as Cæsar calls them) of the interior; and the inhabitants of Devon and Cornwall, withdrawn within their peninsula, may be supposed to have been apt to feel less interest than the rest in the general cause. But even the Brigantes in the north seem early to have taken a part in the resistance to the Roman invasion; and, on more than one occasion, we find them apparently acting in concert with the insurgent tribes within the conquered territory or with the yet unsubdued combatants in the west. The notion of a common nationality, however, even in its faintest form, seems scarcely to have extended beyond the Brigantes; the ruder occupants of the bleak and wild country farther to the north were probably always regarded as the people of another land. Yet although we do not find any actual association of the tribes of the north and south, as thus distinguished, we should perhaps be in error if we were to assume that they kept up no intercourse with each other. If any reliance is to be placed on the correctness even of the general import of the speech which Tacitus puts into the mouth of the Caledonian General Galgacus, we must suppose that the events which had happened in South Britain, since the arrival of the Romans, were both well known, and had excited a deep interest beyond the Grampians. Galgacus, in rousing the valour of his followers, makes his appeal throughout to feelings which he assumes to be common to all Britons, and he alludes to the revolt of the Trinobantes under Boadicea, and to other passages of the conquest of the southern tribes, as to transactions that were familiar to all his hearers.

Section II.

THE GOVERNMENT AND LAWS OF THE ANCIENT BRITONS BEFORE THE INVASION OF THE ROMANS.

We learn from Cæsar, whose account is confirmed by other writers of good authority, that the government of the ancient British nations was, in form at least, monarchical. We are scarcely, however, entitled to assume that each of the tribes or nations we have enumerated had its own king or chief, and formed, in all respects, a distinct and independent state. The same sovereign may in some cases have governed several tribes; or, on the other hand, what is described as a single district inhabited only by one people, may have been divided into several sovereignties. Cæsar, for instance, mentions four kings in Kent; and yet no geographer, or other ancient writer, has spoken of that territory as occupied by more than one nation. Of the rules of succession to the royal authority little is known. We are informed, however, that they made no distinction of sexes in the succession to the royal office;* differing in this from the tribes of the Germanic stock. We have examples of British female sovereigns in Boadicea and Cartismundua.

But though the form of government was monarchical, the British princes appear to have possessed but a small portion of the substance of sovereignty. One of their chief prerogatives was that of commanding the forces of their respective tribes in the time of war. But even then their authority was very much circumscribed by their nobility, and still more by their priests. The Druids, as we have already had occasion to observe, were possessed of very great power among the rude Britons, almost, it would appear, as much as was possessed by the Egyptian priesthood; insomuch that the government among the ancient Britons was more properly a theocracy than either a monarchy, aristocracy, or democracy.

Dio Chrysostom says, speaking of the Celtic nations generally, "Their kings are not allowed to do anything without the Druids; not so much as to consult about putting any design into execution without their participation. So that it is the Druids who reign in reality; and the kings, though they sit on thrones, feast in splendour, and live in palaces, are no more than their instruments and ministers for executing their designs." But the government appears to have had also a mixture in it of popular elements. Ambiorix, king of a people of Gaul, made this excuse to Cæsar for having assaulted his camp:—"That it had not been done with his advice or consent; and that his government was of such a nature that the people had as much power over him as he had over them." The British princes made a similar excuse to Cæsar for having seized and imprisoned his ambassadors,—that is, they laid the blame upon the multitude. These slight intimations, however, are not sufficient to enable us to form any opinion as to the share which

* Tacit. Agric. xvi.

the people really had in the government. With regard to the power of the Druids we have more distinct information.

Among most rude nations the laws receive their force from being regarded as the express commands of their gods. Where a particular order of men are supposed to be the only persons to whom the gods have communicated the knowledge of their commands, this order of men are of course the only persons capable of declaring and explaining those commands to the people. In a word, they are the sole legislators of that people. Moreover, the violations of these laws being considered as violations of the will of heaven, the punishment of such violations could not be committed to any but the ministers of heaven,—to wit, the order of men above specified. In an early state of society a very large proportion of these laws are penal, consequently punishment is the chief employment of the judicial office. Consequently, too, we have the same men who have declared the law as the ministers, and as it were the secretaries of the gods, executing it in virtue of the same privilege. That is, we have the same men performing the legislative and judicial functions. Among the ancient Britons these vast powers were enjoyed by the Druids.*

Of the times, places, and forms of the judicial proceedings of these ghostly judges little or nothing is known. Most of the notices preserved by

* Diod. Sicul. v. 31.—Strabo iv. p. 107. (Lutetiæ 1620.)—Cæsar. B. G. vi. 13, 16.

ARCH DRUID in his full Judicial Costume, and wearing the Breastplate of Judgment, pronouncing Sentence.

Cæsar in relation to these matters we have already given in our general abstract of his account of the Druidical system. The courts of justice in which the Druids presided were, there can be little doubt, like their temples, open to the sky. The vestiges of that in which the chief British tribunal is supposed to have been held are still to be traced in the Isle of Anglesey, and are thus described by Rowland:—"In the other end of this township (of Tre'r Dryw), wherein all these ruins already mentioned are, there first appears a large cirque or theatre, raised up of earth and stones to a great height, resembling a horseshoe, opening directly to the west, upon an even, fair spot of ground. This cirque or theatre is made of earth and stones, carried and heaped there to form the bank. It is, within the circumvallation, about twenty paces over; and the banks, where whole and unbroken, above five yards perpendicular height. It is called Bryn-Gwyn, or Brein-Gwyn, *i. e.* the supreme or royal tribunal."* It appears from Cæsar that the extraction of evidence by torture was a form of judicial procedure sometimes resorted to among the Gauls, and most probably it was also in use among the Britons. Cæsar tells us that it was applied by the Gauls in the case of women who were suspected of having occasioned the death of their husbands; but he does not say that this was the only case in which it was applied. One of the few laws of the Gauls which he expressly mentions is, that when a woman was found guilty of this crime, she was delivered to the flames, and put to death by the aid of excruciating torments. We may here observe that, notwithstanding what is related respecting the promiscuous concubinage in use among the Britons, the marriage connexion appears still to have been distinctly acknowledged and protected by the law. The history of Cartismundua, whose subjects rose in revolt against her and drove her from her kingdom, in their indignation at her profligate abandonment of her husband's bed, shows the general feeling that was entertained upon this subject. Cæsar also informs us that among the Gauls the husbands had the power of life and death both over their wives and their children. Another Gallic law relating to marriage which he mentions is, that, whatever dowry the husband received with his wife, he added to it an equivalent amount; the whole then continued the common property of the two so long as both lived, and, after the death of either, devolved, with all accumulations, upon the survivor. It also appears from his account of the Druids, already quoted, that theft and some other crimes were punished capitally, according to the laws administered by these judges. Their system of law, there can be little doubt, was of as sanguinary a character as their system of religion, of which it made a part.

Of the taxes paid by the Britons to their kings we know nothing further than that the Druids, as already mentioned, took care to be exempted from them, as well as from serving in war, and indeed all other burdens.

We shall conclude this section, necessarily a very meagre one (since we refrain from swelling out our history with idle conjectures), with the account given by Solinus of a singularly constituted government, which he places in the Western Islands of Caledonia, and to which possibly in some features the government of the other British nations may have borne a resemblance. These islands, called the Hebrides, "being only," he says, "separated from each other by narrow firths, or arms of the sea, constitute one kingdom. The sovereign of this kingdom has nothing which he can properly call his own, but he has the free use of all the possessions of all his subjects. The reason of this regulation is, that he may not be tempted to acts of oppression and injustice, by the desire or hope of increasing his possessions, since he knows that he can possess nothing. This prince is not even allowed to have a wife of his own, but he has free access to the wives of all his subjects, that, having no children which he knows to be his own, he may not be prompted to encroach on the privileges of his subjects, in order to aggrandize his family." It is curious that this was one of the means devised by Plato in his Republic, to guard against the same evil. Solinus, however, is not a writer of any authority, and, although most of his stories are stolen, no confirmation or trace of this very strange statement is, we believe, to be found anywhere else. It is not unlikely that he may be merely here exercising his invention in giving "a local habitation and a name" to the philosophical fiction of Plato.

* Mona Antiqua, pp. 89, 90.

Section III.

The Government and Laws of Roman Britain.

The transformation of South Britain into a Roman province necessarily swept away the native government, and established another in its place; the least of the novel characteristics of which was, that it was a government of foreigners. It was a sudden substitution of the institutions of civilization for those of a condition nearly approaching to barbarism. The Romans were certainly, as a nation, the greatest practical statesmen whom the world has yet beheld. Among other people individuals have from time to time arisen who have exhibited vast genius in devising schemes of government, or have shown great capacity for administration. But among the Romans alone there existed institutions which were able to ensure a succession of men who were systematically taught to "sway the rod of empire." The celebrated lines of their great poet were no mere poetical rhapsody —no vain and empty boast.—

> Excudent alii spirantia mollius æra,
> Credo equidem; vivos ducent de marmore vultus;
> Orabunt causas melius; cœlique meatus
> Describent radio, et surgentia sidera dicent

Tu regere imperio populos, Romane, memento;
Hæ tibi erunt artes; pacisque imponere morem,
Parcere subjectis, et debellare superbos.
Æneid, vi. 848.

Let others better mould the running mass
Of metals, and inform the breathing brass;
And soften into flesh a marble face:
Plead better at the bar; describe the skies,
And when the stars descend, and when they rise.
But, Rome, 'tis thine alone, with awful sway,
To rule mankind, and make the world obey;
Disposing peace and war thy own majestic way:
To tame the proud, the fetter'd slave to free;
These are imperial arts, and worthy thee.
Dryden's Translation.

The Roman was probably the wisest oligarchy that ever existed. In Rome, unlike what we have seen happen in other oligarchies, the education of the ruling class was as carefully attended to, as jealously watched over, as the preservation of their privileges. The Roman patrician was carefully and systematically instructed in the art of war, and in such, and such only, of the arts of peace as were to be the source of power, the foundation of dominion over those who aimed at universal dominion. Thus, they made their law, and above all their *actiones legis*,—their law of procedure—a mystery into which a plebeian could never penetrate, but with which they themselves took care to be familiar. Thus among the Romans we sometimes see the most various and apparently (at least to our modern notions on the subject) inconsistent qualities united in the same individual. Without bringing forward cases such as that of the all-accomplished Julius Cæsar, of men of great power and extent of original genius, we might cite instances from the Roman annals of the same man being juris-consult, general, public professor of law, pontifex maximus, consul, dictator.* When we consider that to these various accomplishments were added in the Roman an iron discipline, and a courage, cool, steady, collected, we shall not wonder that his march was to uninterrupted victory and universal empire.

Long after a military despotism had succeeded to the power of that mighty oligarchy, Rome still continued as much of her ancient policy as required that able men, though no longer so exclusively selected from one class, should be appointed to govern her provinces and command her armies. We have only to look at the result to be convinced that Britain was not an exception to this salutary rule.

The ministers of the Roman state, whether called republic or empire, the representatives of the majesty of the Roman name, were educated soldiers, jurisconsults, statesmen; and whatever might be their errors and their vices—and they were, no doubt, many—they conquered, and, up to a certain point, civilized a large portion of the world. In a greater degree than any other people have done, the Romans communicated to the nations they conquered (not merely, as is often falsely asserted, their vices, but) whatever of the blessings of civilization they themselves possessed.

It is interesting to an inhabitant of Great Britain at the present day, to reflect that, towards the beginning of the Christian era, more than 1500 years ago, this island actually possessed, for a period of above 300 years, nearly the whole of the Roman civilization; that, in the second and third centuries of the Christian era, the inhabitants of Britain enjoyed personal security; and, after the payment of the Roman taxes, security of property; arts and letters; elegant and commodious buildings; and roads, to which no roads they have had since could bear comparison, till the establishment of the present railways. As we look along the line of the Greenwich railroad, and contemplate its massive yet elegant arches,—its compact and solid masonry,—its iron highway, and the ponderous yet compact carriages that fly along it, and reflect that the whole kingdom will soon be intersected with similar gigantic structures, we feel as if the times of Roman enterprise, as regards vastness of design and durability of workmanship, had returned. It is an inquiry of no common importance and interest to attempt to learn what were the principal features of that civilization which rose so early, and, after lasting some three centuries, was so rapidly and totally destroyed.

The Roman settlements were originally divided into colonies, municipia, and Latin cities; but, in the decline of the empire, the distinctions between them were obliterated, and they were all invested with equal rights. However, from the importance of the subject, it is fit that we should say something of the rise and progress, as well as of the leading characteristics of the municipia. When we come to treat of the military government of the province, we shall have to say something of the colonies. One leading distinction between them, noted by Aulus Gellius, we may mention here, that the colonies were *sent out* from, the municipia *taken into*, the Roman state.

The Romans, in their conquests, so far pursued a different system from that of most of the ancient nations, that they neither sought to exterminate nor reduce to slavery the nations they conquered. It is the opinion of M. Guizot,* whose opinion on most points of the philosophy of history is entitled to great respect, that this difference arose from the situation of most of the neighbouring tribes on which Rome at first made war. They were assembled in towns, not dispersed over the country. At first, the Romans did not venture to leave their former inhabitants in the conquered towns. They were occupied either by soldiers, or by inhabitants taken from Rome. Cære was the first which preserved its laws and magistrates, and received, in part at least, the rights of Rome.† This example soon became general. There were different degrees, however, of the privilege; and it was only the highest degree that conferred the right of voting at Rome like the Romans. The towns of the last class, whose citizens were thus admitted to all the rights of Roman citizens, were called *municipia*.

* Gravinæ Orig., lib.i. cap. 47 et seq. See also Heineccii Historia Juris Romani.

* Essais sur l'Histoire de France: Paris, 1834. Premier Essai, Du Régime Municipal dans l'Empire Romain, p. 5, et seq.

† Liv. lib. v. cap. i.

Thence arose in those towns a separation between the municipal rights and duties, and the political rights and duties: the former were exercised upon the spot; the latter were transported to Rome, and could only be exercised within its walls. The principal matters which remained local were—1. The religious worship. 2. The administration of the municipal property and revenues. 3. The police, to a certain extent; with 4. A few judicial functions specially connected with it.

All these local affairs were regulated either by individual magistrates, named by the inhabitants, or by the curia of the town, that is, the college of *decuriones*, or inhabitants possessed of a territorial revenue to a certain amount. In general, the magistrates were named by the curia, though sometimes by all the inhabitants. As a necessary consequence of slavery, there were few free men who were not admissible into the curia. Later, the *decuriones* were called *curiales*.

When the Roman government from an aristocracy was changed into an absolute monarchy, the chief men of the municipia, who had repaired to Rome for the purpose of exercising their political powers, and from a natural ambition to share in the government, having no longer the same motive to go to Rome, remained at their respective municipia. Thus the municipia obtained a portion of the importance which Rome lost. This was the flourishing time of the Roman municipia. Their importance during this epoch is attested by the number of laws regarding them, and the attention bestowed upon them by the jurisconsults.

But this epoch of their history was, in process of time, succeeded by another far less prosperous. The imperial despotism had difficulties to struggle with which required vast sums of money. On one side were the barbarians, who were either to be bought off, or beaten. In either case money was wanted—in the first, to pay the barbarians; in the second, to pay the soldiers who fought them. On the other side was a vast and increasing populace, to be fed, amused, and kept under. In order to obtain resources, an administrative machinery was created, capable of extending its action everywhere, but vast and complicated, and consequently itself a source of great expense. The revenues of the towns, as well as those of individuals, came to be in this way laid under contribution. At different times the emperor seized a great quantity of municipal property. Nevertheless, the local burdens for which that property was intended to provide, remained the same, or rather went on increasing, from the increase of the population. When the revenues of a municipality were insufficient for its expenses, the members of the curia (or corporation) were obliged to provide for them out of their private property. Thus the station of decurio became a source of ruin to those who held it, that is, to all the inhabitants in easy circumstances of all the municipia of the empire. And thus was destroyed the middle class of citizens, and the way prepared most effectually for the total ruin of the empire.

This result was accelerated by an exemption from the curial functions being granted to certain individuals and classes as a privilege. So that, as the burdens of the *decuriones* increased, this privilege came in to diminish their numbers. Consequently, the weight pressed with increased and increasing force on those that remained, till it ultimately annihilated the order; and, for a season, a middle class may be said to have disappeared from among mankind. And as human society, without that middle class, is as infirm as any fabric of which the extremities are not bound together, or are bound but by a rope of sand, it is not surprising that the Roman world should have fallen an easy prey to the hordes of warlike barbarians that poured in upon it. *

Besides the main incorporation, each city contained various colleges, or corporations of operatives, who held, says Sir Francis Palgrave, an ambiguous station between slavery and freedom. In these societies employments were hereditary, so that the son of the handicraftsman became a member of the college by birth or caste. It is foreign to our present purpose to enter into an account of these Roman guilds; but we refer the reader who wishes for more information respecting them, to the elaborate and learned discussion on the subject contained in the tenth chapter of Sir Francis Palgrave's work on the "Rise and Progress of the English Commonwealth." That prince of jurisprudential expositors, Heineccius, has also written a work, "De Collegiis et Corporibus Opificum."

When the Romans had established themselves in Britain, they proceeded, according to their usual policy, to make Verulamium a municipium, or free town, bestowing on the inhabitants all the privileges of Roman citizens. When this first happened, the municipal system was in the second stage or epoch of the progress which we have briefly traced above, that is, it was in its flourishing state. London, too, though it does not appear to have been a *municipium*, nor even distinguished by the name of a colony, was, we are informed by Tacitus, † famous for its trade, enjoying, no doubt, some of the advantages of the Roman Municipia. The fact in this particular instance of Britain, agrees with and illustrates the general fact stated above. In a few years the two places above named were crowded with inhabitants, who were all zealous partisans of the Roman government. Both these facts are demonstrated by what happened to these two cities in the great revolt under Boadicea. The revolted Britons, as already related, attacked with fury London and Verulamium, on account of their attachment to the Romans, and destroyed no

* In the above brief account of the Roman municipia, we have chiefly followed the Essay of M. Guizot, above quoted.

† Annal. lib. xiv. cap. xxxiii. His words are, "Londinium—cognomento quidem coloniæ non insigne, sed copiâ negotiatorum et commeatuum maximè celebre." He expressly calls Verulamium a *municipium*. See also Suetonius, Vit. Neron. cap. xxxix. Both Tacitus and Suetonius use the words *civium et sociorum*,—while *civium* may refer to Verulamium, *sociorum* to London. See also Horsley's Britannia Romana, pp. 16 and 28.

fewer than 70,000 of their inhabitants—a sufficient proof of the populousness of those towns.

That populousness also, in so short a time after the establishment of the Romans in the island, is a sufficient proof of the wise policy of the Romans, in reconciling the conquered people to their domination, by their municipal institutions; for the wonder is, not that a part of the Britons made the revolt above alluded to, but that so many of them were already quietly settled, along with the colonists sent out from Italy, or their descendants, in London and Verulamium. The principal towns of every Roman province, besides, as we have already stated, being governed by laws and magistrates similar to those of Rome, were adorned with temples, courts of justice, theatres, statues, and other public buildings and monuments, in imitation of that mighty city—thus imitating the external and physical, as well as the internal and moral characteristics of their metropolis. "The country was replete," says Sir Francis Palgrave, "with the monuments of Roman magnificence. Malmesbury appeals to those stately ruins as testimonies of the favour which Britain had enjoyed; the towers, the temples, the theatres, and the baths, which yet remained undestroyed, excited the wonder and admiration of the chronicler and the traveller; and even in the fourteenth century, the edifices raised by the Romans were so numerous and costly, as almost to excel any others on this side the Alps. Nor were these structures among the least influential means of establishing the Roman power. Architecture, as cultivated by the ancients, was not merely presented to the eye; the art spake also to the mind. The walls covered with the decrees of the legislature, engraved on bronze, or sculptured in the marble; the triumphal arches, crowned by the statues of the princes who governed the province from the distant Quirinal; the tesselated floor, pictured with the mythology of the state, whose sovereign was its pontiff—all contributed to act upon the feelings of the people, and to impress them with respect and submission. The conquered shared in the fame, and were exalted by the splendour of the victors."*

The government of Britain, so long as it formed only one province, is supposed to have been committed, according to custom, to a single president, whose powers appear to have at first been almost discretionary, and but little controlled even by the established laws of the empire. It is sufficiently clear, from what Tacitus says in his Life of Agricola, that the government of the Romans in Britain, before the arrival of Agricola, was extremely oppressive. That excellent person employed his first winter in redressing the grievances of the Britons, which had been so great as to occasion frequent revolts, and render a state of peace more terrible to them than a state of war. One remark of Tacitus, in describing the course of policy pursued by his father-in-law, seems to contain nearly the whole secret of the Roman art of governing their provinces, as distinguished from the barbarous imbecility usually displayed by conquering states in their conduct towards the conquered. "Doctus," he says of Agricola, "per aliena experimenta, *parum profici armis, si injuriæ sequerentur*;"—taught by the experience of others, that little was gained by arms, if success was followed by injuries. The edict of Hadrian, however, promulgated, A.D. 131, and called the perpetual edict, had no doubt the effect of mitigating the tyranny of the provincial presidents, since it contained a system of rules by which they were to regulate their conduct in their judicial capacity, and by which the administration of justice was rendered uniform throughout all the empire.*

From the promulgation of the perpetual edict of the emperor Hadrian to the final departure of the Romans out of this island, was about 300 years; and during that period the laws of Rome were firmly established in all the Roman dominions in Britain. In our sketch of the municipal institutions we have already given the substance of a portion of those laws,—and in what remains to be said we shall have to allude to others. Most of them were embodied in the Theodosian Code, by command of the emperor Theodosius, about the year 438. This code did not, however, as Montesquieu seems to suppose, constitute the whole body of the Roman law in the fifth century. It was a collection of the constitutions of the emperors from Constantine to Theodosius the younger.† Independently of those constitutions, the law of the Twelve Tables; the ancient senatus-consulta, and plebiscita; the edicts of the prætors, or rather the perpetual edict of Hadrian, which had superseded these; and, lastly, the *responsa prudentum*, the opinions of the jurisconsults, formed part of the Roman law. Indeed, in the year 426, by a constitution of Theodosius the younger and Valentinian, the works of five of the great jurisconsults, Papinianus, Paullus, Gaius, Ulpianus, and Modestinus, and of four others *secundo loco*, Scævola, Sabinus, Julianus, and Marcellus, had expressly received the force of law.‡ The Theodosian Code, however, doubtless contained the most important portion of the law of the empire, and is also the document which throws most light on that epoch, particularly when aided by the very learned commentary of Jacobus Gothofred. To attempt to give any detailed account of that vast body of laws in this place would evidently be futile.

It is almost unnecessary to add that the corpus juris, or body of law, promulgated by Justinian, contains in substance much of what was in the Theodosian Code, as well as in the works of those great jurisconsults. And although we cannot join in the admiration expressed by some for the "regular order" of that digest, where order there is none, we must needs admit that, as a body of law, it remains a monument of the good sense of that illustrious people, and of their great practical talents for government and legislation.

‡ Heineccii Hist. Jur. Rom. lib. i. § 368.

It has been the fashion with historical writers* to attribute much of the progress of modern European civilization to the revival of the knowledge of the Roman law, by the discovery of a copy of the Pandects of Justinian at Amalphi, A.D. 1137. Von Savigny, in his History of the Roman Law during the Middle Ages, has completely proved that the Roman law had never perished, and therefore that the story of its resuscitation by the discovery of the Pandects at Amalphi in the twelfth century is erroneous. Indeed, more than half a century before the appearance of the work of Von Savigny, Heineccius had arrived at nearly the same conclusion, though he did not go into such fulness of detail as Von Savigny. † But the reported discovery of the Pandects, and the rapid effects ascribed to that one cause, bear about them something of that air of the miraculous which has always found such favour with mankind.

For the purposes of administration, the Roman territories in Britain were, about 150 years after its first occupation by these conquerors, divided into two provinces, to which three more were afterwards added. The only notice of these divisions which can be perfectly depended on, so far as it goes, is contained in the "Notitia," already mentioned, a document which is of about the same date with the Theodosian Code; ‡ but all that we learn from this document is, that the names of the five provinces were Flavia Cæsariensis, Britannia Prima, Britannia Secunda, Valentia, and Maxima Cæsariensis. As to the parts of the island to which these names were respectively applied, we are altogether in the dark. It is even doubtful whether they were all contained within the wall of Severus, or whether one of them (but which is matter of conjecture) did not comprehend the space between that rampart and the wall of Antoninus. Richard of Cirencester adds a sixth province, to which he gives the name of Vespasiana, and which he makes to extend from the wall of Antoninus to the Moray Frith.

The machinery for governing Britain as well as the other provinces of the Roman empires, varied with the extent of that empire. We shall now give an account of it when it was in its most complete and extensive form. In the fifth century, the emperor Constantine the Great divided the whole Roman empire into the four prefectures of the East, Illyricum, Italy, and Gaul, over each of which he established a prefect. § Each of these prefectures was subdivided into a certain number of dioceses, each of which was governed, under the prefect, by an officer called the vicar of the diocese. The diocese of Britain, as well as those of Gaul and Spain, was comprehended in the prefecture of Gaul.

* See Henry, Hist. of Britain, book i. chap. iii. § 3. Also Heineccius, Robertson, Hume, &c.

† Heineccii Hist. Jur. Rom. lib. i. § 413, 414, 415.

‡ The best edition of it is that with the Commentary of Pancirolus, given in the seventh volume of the Roman Antiquities of Grævius. An account of the portion of it relating to Britain will be found in Horsley's Britannia Romana.

§ Heineccii Hist. Jur. Romani, lib. i. § 365.—Notitia Imperii, with Pancirolus's Commentary.

The court of the vicar of Britain, who resided chiefly at London, was composed of the following officers:—a principal officer of the agents; a principal secretary; two chief accountants; a master of the prisons; a notary; a secretary for despatches; an assistant; under-assistants; clerks for appeals; sergeants and other inferior officers.

Each of the five provinces of Britain had a particular governor, styled a president, who resided within the province. From these governors appeals lay to the vicar, and from him to the prefect of Gaul. The title of the vicar of Britain was Spectabilis, and the ensigns of his office were a book of instructions in a green cover, and five castles, representing the five provinces under his jurisdiction, and placed within a line which imitated the triangular form of the island. Two of the provinces—probably the two most northerly—were governed by persons of consular dignity, the three others by persons styled presidents. The court, or more properly *bureau*, of each of these governors was almost an exact copy, on a smaller scale, of that of the vicar of the diocese and of the prefect of the prefecture.*

It is not necessary to enter into more detail in regard to the various subordinate administrative offices. It is sufficient to observe that they form a complete example of pure and simple administrative despotism. There is no independence for the functionaries; they are subordinate one to another, up to the emperor, who has the absolute disposal of their destiny. There is no appeal for the subjects against the functionaries, but to their superiors. We meet with no co-ordinate powers destined to act as checks upon one another: everything proceeds according to a strictly graduated scale; and yet M. Guizot thinks, and not a few will agree with him, that this administrative machinery of the imperial despotism was less grievous to those who lived under it than the powers which preceded it,—whether the short-lived, but on that account more rapacious, tyranny of the Roman proconsul, republican at least in name, or the barbarous oppression of their native rulers,—their ignorant and ferocious chieftains, and fanatic priests. With respect to the administration of the laws, the Roman governors had the sole judgment of all causes, without other appeal than to the emperor. In the first ages of the empire, and conformably to the ancient customs, he to whom the jurisdiction belonged, whether prætor, governor of the province, or municipal magistrate, when a case came before him for trial, did nothing but determine the rule of law. He then appointed a private citizen, called *judex* (literally "judge"), corresponding to our jury, who examined and decided upon the point of fact. The principle laid down by the magistrate was applied to the fact recognized by the *judex*, and the trial was completed.

In proportion as the imperial despotism was established, the intervention of the judex became less regular. The magistrates, without having recourse

* Notitia Imperii, chap. xlix. Heineccii Antiq. Rom. Append. lib. i.

to that contrivance, decided certain affairs which they called *extraordinariæ cognitiones*. Diocletian formally abolished the institution of the judex in the provinces; it no longer appeared but as an exception to a rule; and, in the time of Justinian, it seems to have fallen completely into desuetude.*

From this it will appear that, in Britain as elsewhere, the governors had two sorts of duties:—1. They were the emperor's ministers, intrusted with the collection of the revenues, with the command and recruiting of the armies, with the management of the imperial posts, and, in a word, of every relation in which the emperor stood to his subjects; 2. They had the administration of justice.† The administrative and judicial departments were thus, contrary to some of the most important principles of good government, strictly combined; the Roman emperors not being of the opinion of George III., when he declared that "he looked upon the independence and uprightness of the judges as essential to the impartial administration of justice,—as one of the best securities of the rights and liberties of his subjects,—and as most conducive to the honour of the crown."‡

When the Romans conquered a people, they generally pursued with them one of two modes;—they either imposed on them an annual tribute, or they took from them their lands, colonizing them from Rome, or restoring them to the conquered people on the condition of their paying a certain proportion of the revenue of them to the conquerors. Those treated in the former manner were called *tributarii;* those treated in the latter, *vectigales*. At first Britain belonged to the former class, but afterwards to the latter. The *vectigales* paid from their arable land a tax called *decumæ*, from their pasture a tax called *scriptura*, and from their ports a tax called *portorium*.§

The *decumæ*, as the name implies, was properly a tithe; but this proportion varied, being sometimes less, sometimes more, than a tenth, according to the exigencies of the occasion and the poverty and fertility of the country.‖ Afterwards, under the emperors, the proportion was settled by the *Canon frumentarius*, or law for supplying Rome, and afterwards Constantinople, with corn.¶ Certain grievances in the manner of levying this tax imposed upon the inhabitants of Britain were remedied by Agricola.** This tax was also levied on other things besides corn, such as vineyards and orchards.

The Romans also levied a tax on pasture-grounds and fruits. This tax was called *scriptura*, because the collector of it wrote down in his books the number of the cattle.†† Under the emperors, this tax was partly levied in kind.‡‡ This tax, when first imposed on them, proved very oppressive to the Britons, their property chiefly then consisting in cattle, and they being obliged to borrow money from some of the wealthy Romans at an exorbitant rate of interest. Seneca is said to have lent the Britons above 322,000*l.*; and his demanding it with rigour at a time when they were unable to pay is supposed to have contributed to the great revolt under Boadicea.*

Another important tax was the *portoria*, or customs, which in Britain are said to have been remarkably heavy. Another was raised from mines of every description. Besides these, there were various other taxes, which pressed heavily on the conquered people.†

The charge of collecting all these taxes was committed to an imperial *procurator*, who had the superintendence of all the inferior officers employed in this branch of administration; and in Britain, as elsewhere, the principal taxes were let to farmers at a yearly rent. We have the authority of Tacitus, that the Britons were exposed to grievous extortions in the raising of them.

The troops which the Romans stationed in Britain to secure their conquest were, according to their usual policy, collected from many distinct and remote provinces of the empire, and differed from the Britons and from each other in their manners and languages.‡ About the same time that the changes which have been described were made in the civil administration of the empire, a similar change was made in the government of the military establishment. Constantine the Great deprived the prætorian prefects of their military command, and appointed in their stead two new officers called magistri militum, one of whom had the command of the cavalry, the other of the infantry. These had not their ordinary residence in Britain; but the Roman troops there were commanded under them by the three following officers: 1. Comes Littoris Saxonici per Britanniam, the Count of the Saxon shore in Britain. 2. Comes Britanniæ, the Count of Britain. 3. Dux Britanniarum, the Duke of Britain.§

Wherever the government is a pure despotism, the principal officers of state will be, at least to a certain extent, the private friends or associates of the monarch, or individual in whose hands is lodged the sovereign power. These will be his counsellors and his ministers. Thus, in the courts of the middle ages, as we shall have occasion to remark hereafter, those who held offices about the king's person, many of which we should consider menial, were, in effect, the king's ministers. In fact, the more modern practice was borrowed from the later Roman and Byzantine emperors. In the courts of

‡ Notitia, § 52. 63. or 71—87, lib. ii. of Pancirolus's division.
§ Notitia, § 52, 53, 63 in Horsley; or 71, 72, 87, lib. ii. of Pancirolus's division. This is the order in which they occur in the Notitia, as we apprehend, without reference to their rank. For it is probable, for reasons which will be assigned in the note on the Count of Britain, that the Duke of Britain, though placed last, was at least equal in rank to the other two functionaries.

the Roman emperors, from Augustus downwards, these counsellors were styled Comites Augustales, or Comites Augusti, companions of the emperor, from their constant attendance on his person. They were divided into three orders or degrees. When they left the imperial court, to take upon them the government of a province, town, or castle, in the exercise of any office, they were no longer called Comites Augustales, but Comites of that province, town, castle, or office. * Of this the Comites Britanniarum, the Counts of Britain, and the Comites Littoris Saxonici per Britanniam, the Counts of the Saxon Shore in Britain, were examples.

The Counts of Britain† are supposed to have had the command originally of about 3000 foot, and 600 horse, in the interior parts of Britain. But afterwards these forces seem to have been withdrawn, or stationed on the frontiers; for, in the section of the Notitia, where the court of this officer is described, there is no mention of any forces under his command. ‡

In the third century the south and east coasts of Britain began to be much infested by Saxon pirates; and thence it is supposed to have got the name of Littus Saxonicum, the Saxon shore.§ To protect the country from these pirates, the Romans not only kept a fleet on these coasts, but also built a chain of forts, which they garrisoned. The officer who commanded in chief all these forts and garrisons, was called Comes Littoris Saxonici per Britanniam, the Count of the Saxon Shore in Britain. These forts were nine in number, and were situated at the following places: 1. Branodunum, Brancaster. 2. Gariannonum, Burghcastle, near Yarmouth, both on the Norfolk coast. 3. Othona, Ithanchester, not far from Malden, in Essex, now overflowed by the sea. 4. Regulbium, Reculver. 5. Rutupæ, Richborough. 6. Dubræ, Dover. 7. Lemannæ, Lime; these four last on the coast of Kent. 8. Anderida, Hastings, or East Bourn, in Sussex. 9. Portus Adurnus, Portsmouth, in Hampshire. * They were garrisoned by about 2200 foot, and 200 horse. The ensigns of the count of the Saxon shore in Britain were, a book of instructions, and the figures of nine castles, representing the nine forts under his command. His court was composed of the following officers:—a principal officer from the court of the master of the foot; two auditors from the same court; a master of the prisons, from the same; a secretary; an assistant; an under-assistant; a registrar; a clerk of appeals; serjeants and other inferior officers.†

The word dux (which originally signified the leader of an army in general) became, under the lower empire, the title of a particular military officer, who commanded the Roman forces in a certain district, commonly on the frontiers ‡. Such was the Dux Britanniarum, the Duke of Britain, who had command on the northern frontier over thirty-seven fortified places, and the troops stationed in them. Twenty-three of these forts were situated on the line of Severus's wall, and the other fourteen at no great distance from it. § In these thirty-seven forts about 14,000 foot and 900 horse were stationed.‖ The court of the Duke of Britain was exactly similar to that of the Count of the Saxon Shore, which has been described above.

The Roman soldiers were not less remarkable for their industry than for their discipline and valour.* These several bodies of troops, composing the standing army of the Romans in Britain, besides performing the then important services of guarding the coasts against the Saxon pirates, preserving the internal tranquillity of the country, and protecting the northern frontiers from the incursions of the Scots and Picts, executed many of those noble works of utility and ornament, the vastness and durability of which, though only contemplated after numerous hordes of destroying barbarians have swept over them, have excited the astonishment and admiration of every successive generation of mankind.

* Selden's Titles of Honour, p. 241, et seq. Du Cange, Gloss. voc. Comites.

† Sir Francis Palgrave (Rise and Progress of the English Commonwealth, vol. i. part i. p. 359) says that the Comites Britanniarum are conjectured to have been the supreme commanders of the diocese. This, too, is the opinion of Brady. (Hist. p. 41.) We do not think this conjecture well founded. There appears reason to believe (see particularly Cod. Theod. lib. vi. t. 14. l. 3, and Gothofred's Commentary upon it) that *generally* the *dux* was a military officer of superior rank to the *Comes*. The law referred to is for the express purpose of placing *certain Comites primi ordinis rei militaris* upon an *equality* with the *duces*, with the special exception of two—the "duces Ægypti et Ponticæ."

‡ Notitia, 72, lib. ii., edit. of Pancirolus.

§ On this subject Sir Francis Palgrave has the following remark: "It has been conjectured that this extensive tract was so denominated, in consequence of being continually exposed to the incursions of the Saxons; but is it not more reasonable to assume that they had already fixed themselves in some portion of the district? For it is a strange and anomalous process to name a country, not from its inhabitants, but from its assailants, and on the opposite "littus Saxonicum," afterwards included in Normandy, they had obtained a permanent domicile in the neighbourhood of Baieux."—*Rise and Progress of the English Commonwealth*, vol i. part i. p. 384. And yet the reader will remark, that the Roman forts were all situated on the very verge of the ocean, some of them on places which it has since overflowed.

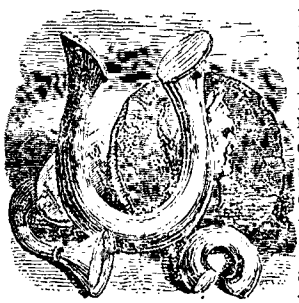
CHAPTER IV.

HISTORY OF THE NATIONAL INDUSTRY.



NDER this title we propose to present a view of the state and progress, in each period, of all those arts commonly called the useful arts, the object of which is to make provision for the maintenance and physical accommodation of human life, and which in every country must necessarily employ the labours of the great body of its inhabitants. The cultivation of the earth and all other modes of procuring food,—the different handicrafts and manufactures practised by the people,—the means of communication and conveyance made use of by them,—their internal trade and foreign commerce, will fall to be here considered. Some of these applications of skill and industry constitute the indispensable foundation on which the whole of the national civilization stands; the rest may be said to form the main body of the fabric. All else that can be added to adorn and elevate the social condition of man depends for its existence upon these; for the fine or ornamental arts are to the necessary or useful arts only what the pillars, and sculptures, and domes, and pinnacles of a building are to the apartments within, to which indeed they may be made to serve for something more than mere decorations, but without which to decorate, and in part also, it may be, to support and cover, they never would have appeared.

As in nearly everything else relating to the British islands during the period at present under review, so with regard to the arts of life practised by the natives, our knowledge is extremely limited and imperfect. No written records, or other literary remains, either of the Britons or of the Gauls, have come down to us. A small number of scattered notices in the Greek and Roman writers, few of whom had any good opportunity of ascertaining the facts of which they make mention, while the subject was probably not one about which they felt much interest, make up all the direct information we possess. Our other lights are to be extracted from the few ruined monuments and other almost obliterated relics and memorials of the primitive Britons which the waste of time has spared, the fragments of a wreck which scarcely tell us anything positively or distinctly, and many of which do nothing more than afford some mystic hints for fancy and conjecture to work upon.

In distributing our scanty materials, we will begin by noticing the intercourse and traffic which appear to have been maintained with this island in early times by foreign nations, the facts belonging to this part of the subject constituting our first knowledge of the ancient Britons, and the natural introduction to an examination of the internal condition of the country.

The small beginnings, hidden in the depths of ancient time, of that which has become so mighty a thing as British commerce, have an interest for the imagination, the same in kind with that belonging to the discovery of the remote spring or rill which forms the apparently insignificant source of some famous river, but as much higher in degree as the history of human affairs is a higher study than the history of inanimate nature.

The Phœnicians, the great trading people of antiquity, are the first foreigners who are recorded to have opened any commercial intercourse with the British islands. There are some facts which make it probable that this extremity of the globe was visited even by the navigators of the parent Asiatic states of Sidon and Tyre. Tin, a product then to be obtained only from Britain and Spain, was certainly used in considerable quantities by the civilized nations of the earliest times. It was the alloy with which, before they attained the knowledge of the art of giving a high temper to iron, they hardened copper, and made it serve for warlike instruments and many other purposes. A mixture of copper and tin, in due proportions, was perhaps fitted, indeed, to take a sharper edge as a sword or spear than could have been given to iron itself, for a long time after the latter metal came to be known and wrought. It is certain at least that swords and other weapons fabricated of the compound metal continued to be used long after the introduction of iron. This composition was really what the Greeks called *chalcus* and the Romans *aes*, although these words have usually been improperly translated brass, which is compounded not of copper and tin, but of copper and zinc. There is no reason to suppose that zinc was at all known to the ancients; and if so, brass, properly so called, was equally unknown to them. What is commonly called the brass of the Greeks and Romans, being, as we have said, a mixture of copper and tin, is not brass, but bronze. This is the material, not only of the ancient statues, but also of

many of their other metallic articles both ornamental and useful. It was of this, for instance, that they fabricated the best of their mirrors and reflecting specula; for the composition, in certain proportions, is capable of taking a high polish, as well as of being hammered or filed to a sharp and hard edge in others. This also is the material of which so many of the Celtic antiquities are formed, and which on this account is sometimes called Celtic brass, although it might with as much propriety be called Greek brass, or Roman brass. In like manner the swords found at Cannæ, which are supposed to be Carthaginian, are of bronze, or a composition of copper and tin. Tin, too, is supposed, with much probability, to have been used by the Phœnicians at a very early period in those processes of dyeing cloth for which Tyre in particular was so famous. Solutions of tin in various acids are still applied as mordants for fixing colours in cloth. Tin is understood to be mentioned under the Hebrew term *oferet*, in the Book of Numbers;* and as all the other metals supposed to have been then known are enumerated in the same passage, it would be difficult to give another probable translation of the word. This would carry the knowledge and use of tin back to a date nearly 1500 years antecedent to the commencement of our era. At a much later date, the prophet Ezechiel is supposed to mention it under the name of *bedil* as one of the commodities in which Tyre traded with Tarshish, probably a general appellation for the countries lying beyond the Pillars of Hercules. The age of Ezekiel is placed nearly six centuries before the birth of Christ; but we have evidence of the knowledge and employment of tin by the Phœnicians at a much earlier period in the account of the erection and decoration of the Temple of Solomon, the principal workmen employed in which—and among the rest the makers of the articles of brass, that is, bronze, and other metals—were brought from Tyre.

The oldest notice, or that at least professing to be derived from the oldest sources, which we have of the Phœnician trade with Britain, is that contained in the narrative of the voyage of the Carthaginian navigator Himilco, which is given us by Festus Avienus.† This voyage is supposed to have been performed about 1000 years before the commencement of our era. Himilco is stated to have reached the isles of the Œstrymnides within less than four months after he had set sail from Carthage. Little doubt can be entertained, from the description given of their position and of other circumstances, that these were the Scilly islands. The Œstrymnides are placed by Avienus in the neighbourhood of Albion and of Ireland, being two days' sail from the latter. They were rich, he says, in tin and lead. The people are described as being numerous, high-spirited, active, and eagerly devoted to trade; yet they had no ships built of timber wherewith to make their voyages, but in a wonderful manner effected their way along the waters in boats constructed merely of skins sewed together. We must suppose the skins or hides were distended by wicker-work which they covered, although that is not mentioned. There are well-authenticated accounts of voyages of considerable length made in such vessels as those here described at a much later period.

It is observable that in this relation neither the Œstrymnides, nor the Sacred Isle of the Hiberni, nor that of the Albiones in its neighbourhood, appear to be spoken of as discoveries made by Himilco; on the contrary, the Isle of the Hiberni is described as known by the epithet of the Sacred Isle to the ancients, and the resort for the purposes of traffic to the Œstrymnides is declared to have been a custom of the inhabitants of Tartessus and Carthage.

No mines of any kind are now wrought in the Scilly islands; but they present appearances of ancient excavations, and the names of two of them, as Camden has remarked, seem to intimate that mining had been at one time carried on in them. They may in early times have produced lead as well as tin; or, these metals here obtained by the Phœnicians or their colonists of Tartessus and Carthage, may have been brought from the neighbouring peninsula of Cornwall, which produces both, and which besides was most probably itself considered one of these islands. Pliny, it may be noted, has preserved the tradition, that the first person who imported lead (by which name, however, he designates both lead and tin) from the island of Cassiteris was Midacritus, which has been supposed to be a corruption of Melicartus, the name of the Phœnician Hercules. Cassiteris means merely the land of tin, that metal being called in Greek *cassiteron*.

The next notice which we have of the trade of the Phœnicians, or their colonists, with Britain, is that preserved by Strabo. His account is, that the traffic with the isles called the Cassiterides, which he describes as being ten in number, lying close to one another, in the main ocean north from the Artabri (the people of Gallicia), was at first exclusively in the hands of the Phœnicians of Gades, who carefully concealed it from all the rest of the world. Only one of the ten islands, he states, was uninhabited; the people occupying the others wore black cloaks, which were girt about the waist and reached to their ankles: they walked about with sticks in their hands, and their beards were as long as those of goats. They led a pastoral and wandering life. He expressly mentions their mines both of tin and lead, and these metals, he adds, along with skins, they give to the foreign merchants who resort to them in exchange for earthenware, salt, and articles of bronze.

We may here observe that the geographer Dionysius Periegetes gives the name of the Isles of the Hesperides to the native country of tin, and says that these isles, which he seems to place in the neighbourhood of Britain, are inhabited by the wealthy descendants of the famous Iberians. It is

* xxxi. 22. † See ante, p. 14.

remarkable that Diodorus Siculus describes the Celtiberians, or Celts of Spain, as clothed in black and shaggy cloaks, made of a wool resembling the hair of goats, thus using almost the same terms which Strabo employs to describe the dress of the people of the Cassiterides. The chief island of the Scilly group is called Silura by Solinus; and perhaps the original occupants of these isles were the same Silures who are stated to have afterwards inhabited South Wales, and whose personal appearance, it may be remembered, Tacitus has expressly noted as betokening a Spanish origin.

It was undoubtedly through the extended commercial connexions of the Phœnicians, that the metallic products of Britain were first distributed over the civilized word. A regular market appears to have been found for them by these enterprising traffickers in some of the most remote parts of the earth. Both Pliny and Arrian have recorded their export to India, where the former writer says they were wont to be exchanged for precious stones and pearls. It is probable that this commerce was at one time carried on, in part at least, through the medium of the more ancient Palmyra, or Tadmor of the Desert, as it was then called, which is said to have been founded by Solomon a thousand years before our era.*

The Phœnicians, and their colonists settled in Africa and the south of Spain, appear to have retained for a long period the exclusive possession of the trade with the British islands, even the situation of which they contrived to keep concealed from all other nations. It appears from Herodotus, that, in his time, about four centuries and a half before the birth of Christ, although tin was known to come from certain islands which, on that account, went by the name of the Cassiterides, or Tin Isles, yet all that was known of their situation was, that they lay somewhere in the north or north-west of Europe. It is generally supposed that the first Greek navigator who penetrated into the seas in this part of the world was Pytheas of Marseilles, who is said to have flourished about a hundred years after the time of Herodotus. From this celebrated colony of Marseilles something of the Greek civilization seems early to have radiated to a considerable distance over the surrounding regions; but whether there ever was any direct intercourse between Marseilles and Britain we are not informed. The only accounts of the trade which have come down to us, represent it as carried on through the medium of certain ports on the coast of Gaul, nearest to our island; and we are probably to understand that the ships and traders belonged, not to Marseilles, but to these native Gallic towns. From the north-west coast of Gaul, the tin and lead seem to have been for a long time transported across the country to Marseilles, by land-carriage.

Strabo relates, on the authority of Polybius, that when Scipio Africanus the younger made inquiry respecting the tin islands of the people of Marseilles, they professed to be totally ignorant of where they lay. From this we must infer, either that the Massilians had adopted the policy of the Carthaginians with regard to the navigation to these isles, and studiously concealed what they knew of them, or, what is more probable, that they really knew nothing of the countries from which their tin came, the trade being, in fact, carried on, as we have just supposed, through the medium of the merchants of the north-west coast of Gaul. The Romans, according to the account given by Strabo in another place, had made many endeavours to discover the route to these mysterious isles, even while the trade was still in the exclusive possession of the Carthaginians. He relates, that, on one occasion, the master of a Carthaginian vessel finding himself pursued, while on his way to the Cassiterides, by one whom the Romans had appointed to watch him, purposely ran his vessel aground; and thus, although he saved his life, sacrificed his cargo, the value of which, however, was repayed to him, on his return home, out of the public treasury. But the Romans, he adds, at length succeeded in discovering the islands, and getting the tin trade, or at least a part of it, into their own hands. As Strabo died A.D. 25, this commercial intercourse of the Romans with the south-west of Britain must have long preceded the invasion of the south-eastern part of the country by Claudius, and may very possibly have preceded even the earlier invasion by Cæsar. It is remarkable that Strabo does not speak of it as having been a consequence of, or in any degree connected with the last-mentioned event. He says, that some time after its commencement, a voyage was made to the island by a Roman navigator of the name of Publius Crassus, who, finding the inhabitants of a pacific disposition, and also fond of navigation, gave them some instructions, as the words seem to imply, for carrying it on upon a larger scale. This passage has attracted less attention than it would seem to deserve; for, if the Cassiterides be, as is generally supposed, the Scilly islands, we have here the first notice of any commercial intercourse carried on with Britain by the Romans, and a notice which must refer to a date considerably earlier than that at which it is usually assumed that the country first began to be resorted to by that people.

We are inclined to believe, however, that the trade of the Romans with the Cassiterides was entirely confined to their colonial settlements in the south of Gaul. Of these the city of Narbonne, situated about as far to the west of the mouth of the Rhone as the Greek city of Marseilles stood to the east of it, was the chief, as well as one of the oldest, having been founded about the year B. C. 120. The historian Diodorus Siculus, who was contemporary with Julius Cæsar, has given us an

* See in Maurice's Indian Antiquities, vol. vi. pp. 249, &c., a "Dissertation on the Commerce carried on in very remote ages by the Phœnicians, Carthaginians, and Greeks, with the British Islands, for their ancient staple of tin, and on their extensive barter of that commodity with those of the Indian Continent; the whole confirmed by extracts from the Institutes of Menu, &c." The extracts from the Institutes of Menu, however, hardly deserve this formal announcement; and the essay, altogether, is, like everything else of this author's, a very wordy performance.

account of the manner in which the trade between Britain and Gaul was carried on in his day, which, although it does not expressly mention the participation of either the Romans or any of their colonies, at least shows that the Cassiterides and the island of Britain had become better known than they were a hundred years before in the time of the younger Scipio. Diodorus mentions the expedition of Cæsar, of which he promises a detailed account in a part of his history now unfortunately lost; but he tells us a good many things respecting the island, the knowledge of which could not have been obtained through that expedition. We must, therefore, suppose that he derived his information either through an intercourse with the country which had arisen subsequent to and in consequence of Cæsar's attempt, or, as is much more probable, from the accounts of those by whom the south-western coast had been visited long before. Indeed, various facts concur to show that, however ignorant of Britain Cæsar himself may have been when he first meditated his invasion, a good deal was even then known about it by those of the Greeks and Romans, who were curious in such inquiries. Cæsar notices the fact of tin, or white lead, as he calls it, being found in the country; but he erroneously places the stores of this mineral in the interior (*in mediterraneis regionibus*), probably from finding that they lay a great distance from the coast at which he landed; and he does not seem to have any suspicion that this was really the famous Land of Tin, the secret of whose situation had been long guarded with such jealous care by its first discoverers, and which his own countrymen had made so many anxious endeavours to find out. But a century and a half before Polybius, as he tells us himself, had intended to write respecting Britain; and Strabo informs us that the great historian had actually composed a treatise on the subject of the British islands, and the mode of preparing tin. His attention had probably been drawn to the matter by the inquiries of his friend Scipio; for Polybius, as is well known, was the companion of that celebrated general, in several of his military expeditions and other journeys. No doubt, although the people of Marseilles were unwilling or unable to satisfy the curiosity of the travellers, they obtained the information they wanted from some other quarter. * And in the title of this lost treatise of Polybius, as quoted by Strabo, it is important to remark, that we find the tin country distinctly recognized as being the British islands, the vague or ambiguous name of the Cassiterides being dropped. It is so, likewise, in the account given by Diodorus. That writer observes that the people of the promontory of Belerium (the Bolerium of Ptolemy, and our present Land's End) were much more civilized than the other British nations, in consequence of their intercourse with the great number of foreign traders who resorted thither from all parts. This statement, written subsequently to Cæsar's expedition, warrants us in receiving that writer's assertion as to the superior refinement of the inhabitants of Kent, as true only in a restricted sense. In fact, there were two points on the coast of the island separated by a long distance from each other, at which the same cause, a considerable foreign commerce and frequent intercourse with strangers, had produced the same natural effect. Diodorus goes on to describe the manner in which these ancient inhabitants of Cornwall prepared the tin which they exported. To this part of his description we shall afterwards have occasion to advert. After the tin has been refined and cast into ingots, he says, they convey it in wheeled carriages over a space which is dry at low water, to a neighbouring island, which is called Ictis; and here the foreign merchants purchase it, and transport it in their ships to the coast of Gaul. The Ictis of Diodorus has, by the majority of recent writers, been assumed to be the Isle of Wight, the Uectis of Ptolemy, and the Vectis or Vecta of some of the Latin writers. But this seems to us altogether an untenable supposition. It is impossible to believe either that Diodorus would call the Isle of Wight an island in the neighbourhood of the promontory of Bolerium, seeing that it is distant from that promontory about 200 miles, or that the people of Bolerium, instead of carrying down their tin to their own coast, would make a practice of transporting it by land carriage to so remote a point. Least of all is it possible to conceive how a journey could be accomplished by wheeled carriages from the Land's End to the Isle of Wight over the sands which were left dry at low water, as Diodorus says was the case. There can be no doubt whatever that Ictis was one of the Scilly isles, between which group and the extremity of Cornwall a long reef of rock still extends, part of which appears, from ancient documents, to have formed part of the main land at a comparatively recent date, and which there is no improbability in supposing may have afforded a dry passage the whole way in the times of which Diodorus writes. The encroachments of the sea have unquestionably effected extensive changes in that part of the British coast; and at a very remote period it is evident from present appearances, as well as from

* Camden has here expressed himself in a manner singularly contrasting with his customary, and, it may be justly added, characteristic accuracy. First, in order to prove "that it was late before the name of the Britons was heard of by the Greeks and Romans," he quotes a passage from Polybius, which in the original only implies that it was doubtful whether the north of Europe was entirely encompassed by the sea, but which he renders as if it asserted that nothing was known of Europe to the north of Marseilles and Narbonne at all. Polybius has, in fact, himself described many parts of Gaul to the north of these towns. Next he makes the historian to have been the friend, not of the younger, but of the elder Africanus, and to have travelled over Europe not about B.C. 150, but 370 years before Christ. Even if he had been the contemporary of the elder Scipio, this would be a monstrous mistake. The whole of this passage in Camden, however (it is in his chapter on the Manners of the Britons), is opposed to his own opinions as expressed in other parts of his work. The authority of Festus Avienus, which he here disclaims, he elsewhere makes use of very freely (see his chapter on the Scilly islands, at the end of the Britannia). And whereas he contends here that Britain had never been heard of by the Greeks till a comparatively recent date, he has a few pages before a long argument to prove that it must have been known "to the most ancient of the Greeks." In the same chapter (on the Name of Britain) he quotes a passage from Pliny, in which that writer characterizes the island as famous in the writings (or records, as it may be translated) of the Greeks and Romans—"clara Græcis nostrisque monumentis."

facts well attested by records and tradition, that the distance between the Scilly isles and the main land must have been very much less than it now is. "It doth appear yet by good record," says a writer of the latter part of the sixteenth century, "that whereas now there is a great distance between the Syllan Isles and point of the Land's End, there was of late years to speak of scarcely a brooke or drain of one fathom water between them, if so much, as by those evidences appeareth that are yet to be seen in the lands of the lord and chief owner of those isles." * Some of the islands even may have been submerged in the long course of years that has elapsed since the Ictis was the mart of the tin trade; and the numerous group of islets which we now see may very possibly be only the relics left above water of the much smaller number, of a considerable size, which are described as forming the ancient Cassiterides. It may be added that if the south-west coast of Brittany, where the maritime nation of the Veneti dwelt, was, as seems most probable, the part of the continent from which the tin ships sailed, the Isle of Wight was as much out of their way as of that of the people of Bolerium. The shortest and most direct voyage for the merchants of Vannes was right across to the very point of the British coast where the tin mines were. It appears to us to admit of little doubt that the Ictis of Diodorus is the same island which, on the authority of the old Greek historian, Timæus, is mentioned by Pliny under the name of Mictis, and stated to lie six days' sail *inward* (*introrsus*) from Britain (which length of navigation, however, the Britons accomplished in their wicker boats), and to be that in which the tin was produced. It must no doubt have taken fully the space of time here mentioned to get to the Scilly isles from the more distant parts even of the south coast of Britain.

Diodorus goes on to inform us that the foreign merchants, after having purchased the tin at the Isle of Ictis, and conveyed it across the sea to the opposite coast of Gaul, were then wont to send it overland to the mouth of the Rhone, an operation which consumed thirty days. At the mouth of the Rhone it was no doubt purchased by the merchants of Marseilles, and at a later period also by their rivals of Narbonne, if we are not rather to suppose that the Gallic traders who brought it from Britain were merely their agents. Cæsar, however, expressly informs us that the Veneti, who occupied a part of the present Bretagne, had many ships of their own, in which they were accustomed to make voyages to Britain. From the two great emporia in the south of France the commodity was diffused over all other parts of the earth, as it had been at an earlier period from Cadiz and the other Phœnician colonies on the south coast of Spain.

It appears from Strabo, however, that the operose and tedious mode of conveyance by land carriage from the coast of Brittany to the gulf of Lyons was eventually abandoned for other routes, in which some advantage could be taken of the natural means of transportation afforded by the country. By one of these, the British goods being brought to the mouth of the Seine, in Normandy, were sent up that river as far as it was navigable, and then, being carried on horses a short distance overland, were transmitted for the remainder of the way down the Rhone, and afterwards along the coast to Narbonne and Marseilles. It is probable enough that the Isle of Wight, which is opposite to the mouth of the Seine, may have been used as the mart of the British trade in this navigation, for which purpose it was also well adapted, as lying about midway between Cornwall and Kent, and being therefore more conveniently situated than any other spot both for the supply of the whole line of coast with foreign commodities, and for the export of native produce. When the route we are now describing came to be adopted for the British trade generally, even a portion of the tin of Cornwall may have found its way to this central depôt. But even after land carriage came to be displaced by river navigation, a large portion of the British trade still continued to be carried on from the west coast of Gaul, through the medium both of the Loire and the Garonne. The Loire seems to have been taken advantage of chiefly to convey the exports from Narbonne and Marseilles down to the sea-coast after they had been brought by land across the country from Lyons, to which point they had been sent up by the Rhone. The Garonne was used for the conveyance to the south of France of British produce, which was sent up that river as far as it was navigable, and thence carried to its destination over land.

This is nearly all that is known respecting the commercial intercourse of Britain with other parts of the world before the country became a province of the Roman empire. The traffic both with Carthage and the Phœnician colonies in the south of Spain had of course ceased long before Cæsar's invasion; at that date the only direct trade of the island was with the western and north-western coasts of Gaul, from the Garonne as far probably as to the Rhine; for, in addition to the passage of commodities, as just explained, to and from Provence, the Belgic colonists, who now occupied so large a portion of the maritime districts in the south of Britain, appear also from their first settlement to have kept up an active intercourse with their original seats on the continent, which stretched to the last-mentioned river. The British line of communication, on the other hand, may be presumed to have extended from the Land's End to the mouth of the Thames; though it was probably only at two or three points in the course of that long distance that the continental vessels were in the habit of touching. There is no evidence that any of the vessels in which the trade with the continent was carried on belonged to Britain. The island in those days seems only to have been resorted to by strangers as the native place of certain valuable commodities, and to have maintained little

* Harrison's Description of England, b. iii. c. 7.

or no interchange of visits with foreign shores. Even from this imperfect intercourse with the rest of the world, however, the inhabitants of all this line of coast must have been enabled to keep up, as we are assured they did, a very considerably higher degree of civilization than would be found among the back-woodsmen beyond them. It is to be remembered that no small amount of the commercial spirit may exist in a country which maintains no intercourse with foreigners except in its own ports. The situation of Britain in this respect, two thousand years ago, may be likened indeed to that of Spitzbergen or New Zealand at present; but the same peculiarity, which at first sight seems to us so remarkable and so unnatural, characterizes the great commercial empire of China. There the national customs and the institutions of the government have done their utmost to discourage and restrain the spirit of commercial enterprise; but that spirit is an essential part of the social principle, and as such is unextinguishable wherever the immutable circumstances of physical situation are not adverse to its development. Hence, although their laws and traditionary morality have operated with so much effect as to prevent the people of China from pushing to any extent what may be called an aggressive commerce, that is to say, from seeking markets for their commodities in foreign countries, these adverse influences have not been able so far to overcome the natural incentives arising out of their geographical position as to induce them to refrain equally from what we may call admissive commerce, or indeed to be other than very eager followers of it. The case of the early Britons may have been somewhat similar. The genius of most of the Oriental religions seems to have been opposed to foreign intercourse of every kind, the prohibition or systematic discouragement of which the priests doubtless regarded as one of their most important securities for the preservation of their influence and authority; and very probably such may also have been the spirit of the Celtic or Druidical religion. It is remarkable, at least, that the well-ascertained Celtic tribes of Europe, though distributed for the most part along the sea-coast, have never exhibited any striking aptitude either for navigation or for any employment in connexion with the sea.

The most particular account of the exports and imports constituting the most ancient British trade is that quoted above from Strabo, and it is probably not very complete. It only adds the single article of skins to the tin and lead mentioned by Festus Avienus and others. It is probable, however, that the island was known for a few other products besides these, even before the first Roman invasion. Cæsar expressly mentions iron as found, although in small quantities, in the maritime districts. And it appears from some passages in the Letters of Cicero, that the fame of the British war-chariots had already reached Rome. Writing to Trebatius, while the latter was here with Cæsar, B.C. 55, after observing that he hears Britain yielded neither gold nor silver, the orator playfully exhorts his friend to get hold of one of the essеda of the island, and make his way back to them at Rome with his best speed. In another epistle he cautions Trebatius to take care that he be not snatched up and carried off before he knows where he is, by some driver of one of these rapid vehicles. Strabo's account of the foreign commodities imported into Britain in those days is, that they consisted of earthenware, salt, and articles of bronze, which last expression is undoubtedly to be understood as meaning not mere toys, but articles of use, in the fabrication of which bronze, as we have explained above, was the great material made use of in early times. Cæsar also testifies that all the bronze made use of by the Britons was obtained from abroad. The metal, however, as we shall presently have occasion to show, was probably imported to some extent in ingots or masses, as well as in manufactured articles. Much of the bronze which was thus brought to them, whether in lumps of metal, or in the shape of weapons of war and other necessary or useful articles, had no doubt been formed by the aid of their own tin. Neither the Britons themselves, nor any of the foreigners who traded with them at this early period, appear to have been aware of the abundant stores of copper which the island is now known to contain. Indeed the British copper-mines have only been wrought to any considerable extent in very recent times.

Having thus collected and arranged the few but interesting facts that have been preserved relating to the earliest interchange of their own commodities for those of foreign parts, carried on by the ancient Britons, we now proceed to take a survey, as far as our scanty sources of information enable us to do, of the different arts of life which appear to have been known and practised among themselves.

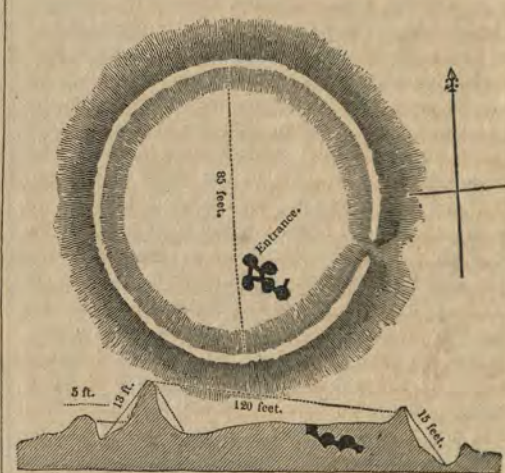
We begin with their modes of obtaining subsistence. The country, as has already appeared, is presented to us, when the first light of history dawns upon it, as inhabited by a mixed race of people, divided into many tribes, varying more or less from each other in dress, customs, and acquirements; those situated farthest from the south coast being the rudest in their manner of life, and the most deficient in general information. These, as we are informed by Cæsar, never sowed their land, but followed the primitive callings of the hunter and the herdsman, clad in the skins, and living upon the flesh and the milk of their flocks and herds, and the spoils of the chase, which was at once their sport and their occupation. Although they had abundance of milk, however, some of the Britons, according to Strabo, were ignorant of the art of making cheese; and it is asserted by Xiphilinus, that none of them ever tasted fish, although they had multitudes in their lakes and rivers; but whether from an ignorance of the art of fishing, or from some religious or other prejudice, does not appear. Cæsar, who says nothing of this, states that they thought it wrong to eat either the hare, the common fowl, or the goose, although they reared these animals for pleasure. The limits of

HARE STONE, CORNWALL.—From King's Munimenta Antiqua.

pasturage were marked as in the patriarchal times, recorded in the Scriptures, by large, upright, single stones, numbers of which are still to be found all over the kingdom, and are known by the names of hoar or hare stones (*i. e.* literally border or boundary stones) in England, and maen hir or menni gwyr in Wales.*

The southern tribes inhabiting the coasts of the British channel, and more particularly the Cantii or people of Kent, are distinguished by Cæsar as resembling in habits and manners the Belgic Gauls, their opposite neighbours and kinsmen. They possessed the same knowledge of agriculture, and, according to Pliny, were not only acquainted with the modes of manuring the soil in use in other countries, but practised one peculiar to themselves and the Gauls. This was the application of marl to that purpose; and one white chalky sort is mentioned, the effects of which had been found to continue eighty years; "no man," it is added, "having yet been known to have manured the same field twice in his lifetime." Of the British instruments, and methods of ploughing, sowing, and reaping, we have no information; but they were probably the same as in Belgium and Gaul, and little different from those used in Italy at that period.

To the flail the Britons appear to have been strangers; for Diodorus Siculus tells us they had granaries or subterranean chambers, in which they housed their corn in the ear, beating out no more than they required for the day; then, drying and bruising the grain, they made a kind of food of it for immediate use. Some vestiges of this ancient practice were remaining not long ago in the western isles of Scotland. "It is called *graddan*," says Martin, "from the Irish word *grad*, which signifies *quick*. A woman, sitting down, takes a handful of corn, holding it by the stalks in her left hand, and then sets fire to the ears, which are presently in a flame; she has a stick in her right hand, which she manages very dexterously, beating off the grain at the very instant when the husk is quite burnt; for, if she miss of that, she must use the kiln; but experience has taught them this art to perfection. The corn may be so dressed, winnowed, ground, and baked within an hour."*



GROUND-PLAN AND SECTION OF THE SUBTERRANEAN CHAMBER AT CARRIGHILL, IN THE COUNTY OF CORK.

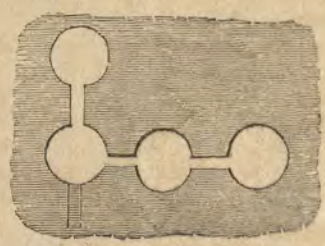
Plan of Chambers on a Farm Twelve Miles from Ballyhendon.



Plan of Chambers at Ballyhendon.

Section of a Chamber at Kildrumpher.

Several subterranean caves were discovered in 1829, on a farm named Garranes, in the parish of Carrighhill, about nine miles east of Cork, perfectly corresponding with the descriptions of Diodorus and Tacitus, the latter of whom mentions the existence of a similar practice amongst the ancient Germans. They were situated within a circular intrenchment, commonly but improperly called a Danish fort. They consisted of five chambers of an oval or circular form about seven or eight feet each in diameter, communicating with each other by narrow passages. A considerable quantity of charcoal was found in them, and the fragments of a quern or hand-mill.* More were subsequently discovered in other parts of the south of Ireland, differing only from the above in their being lined with stone;† and some are still remaining in the western isles of Scotland‡ and in Cornwall.§ The pits near Crayford and at Faversham in Kent, at Tilbury in Essex, and at Royston in Hertfordshire, are also presumed to have been made for or appropriated to that purpose.‖ Of gardening Strabo expressly states that some of the Britons knew nothing, any more than others did of agriculture; and we have no notices of any fruits or garden vegetables cultivated in the country before its subjugation by the Romans.

With regard to the houses of the Britons, at the period of the Roman invasion, we have the testimony of Cæsar, that on the southern coast, where they were numerous, they were nearly of the same description with those of the Gauls. Diodorus Siculus calls them wretched cottages, constructed of wood, and covered with straw; and those of Gaul are described by Strabo as being constructed of poles and wattled work, in the form of a circle, with lofty, tapering, or pointed roofs. Representations of the Gaulish houses occur on the Antonine column, agreeing sufficiently with the description of Strabo, but the roofs are in general domed.

Gaulish Huts.—From the Antonine Column.

They all have one or more lofty arched entrances; but from want of skill in the artist, they certainly appear, as a modern writer has remarked, more like the large tin canisters set up as signs by grocers, than habitable buildings.* At Grimspound, Devonshire,† in the island of Anglesey,‡ and in many other parts of the United Kingdom, vestiges are to be seen of stone foundations and walls, apparently of circular houses. Near Chun Castle, in Cornwall, are several dilapidated walls of circular buildings, the foundations detached from each other, and consisting of large stones piled together without mortar: each hut measures from ten to twenty feet in diameter, and

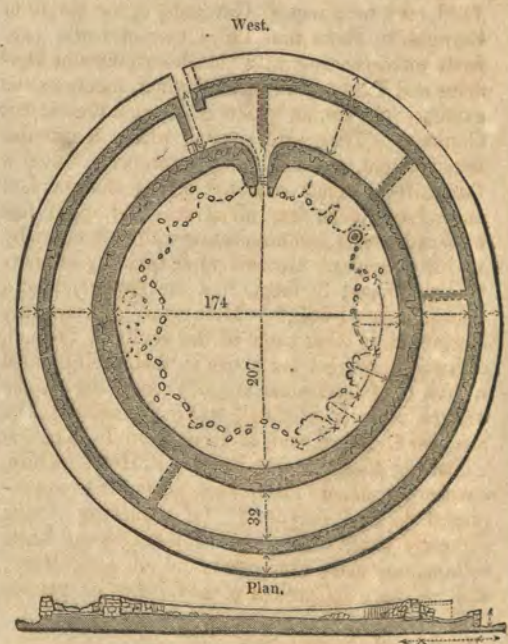
WELSH PIG-STYE, supposed to represent the form of the Ancient British Houses. (See Note.)

has a doorway with an upright stone or jamb on each side. There is no appearance of chimneys or windows.*

They had nothing amongst them answering to the Roman ideas of a city or town. "What the Britons call a town," says Cæsar, "is a tract of woody country, surrounded by a vallum (or high bank) and a ditch for the security of themselves and cattle against the incursions of their enemies;" and Strabo observes, "The forests of the Britons are their cities; for, when they have inclosed a very large circuit with felled trees, they build within it houses for themselves and hovels for their cattle. These buildings are very slight, and not designed for long duration." What Cæsar calls a vallum and ditch is expressed in Welsh by the words *caer* and *din* or *dinas;* the same with the Gaelic *dun*. The caer is generally found to consist of a single vallum and ditch. Such is the circular intrenchment called Caer Morus, in the parish of Cellan, county of Cardigan. The dun, din, or dinas was a more important work, and generally crested like a fortress some very commanding situation. The Catterthuns in Angusshire, Scotland, are posts of great strength. The mountain on which they stand is bifurcated with a fortress on each peak, the highest called the White, the other the Black Catterthun. The white is of an oval form, and made of a stupendous dike of loose white stones, whose convexity from the base within to that without is 122 feet. On the outside of a hollow made by the disposition of the stones, is a rampart surrounding the whole, at the base of which is a deep ditch, and below that, about 100 yards, are vestiges of another that went round the hill. The area within the stony mound is flat: the greatest extent of the oval is 436 feet; the transverse line is 200. Near the east side is the



PLAN AND SECTION OF CHUN CASTLE.

* Borlase. Britton's Architectural Antiquities, ii, p. 57. Archæologia, vol. xxii. p. 300, and Appendix.

foundation of a rectangular building, and on most parts are the foundations of others, small and circular. There is also a hollow, now almost filled with stones, which was once the well of the place.*

The towns of the warlike Britons were all, in fact, military posts; and we have the testimony of Cæsar, that they evidenced distinguished skill in fortification and castrametation. The capital of Cassivellaunus he describes as admirably defended (*egregie unitum*) both by nature and art. Chun Castle, which we have before mentioned, is another highly interesting specimen of an ancient British dun, or fortress. It consists of two circular walls, having a terrace thirty feet wide between. The walls are built of rough masses of granite of various sizes, some five or six feet long, fitted together, and piled up without cement, but presenting a regular and tolerably smooth surface on the outside. The outer wall was surrounded by a ditch nineteen feet in width: part of this wall in one place is ten feet high, and about five feet thick. Borlase is of opinion that the inner wall must have been at least fifteen feet high; it is about twelve feet thick. The only entrance was towards the south-west, and exhibits in its arrangement a surprising degree of skill and military knowledge for the time at which it is supposed to have been constructed. It is six feet wide in the narrowest part, and sixteen in the widest, where the walls diverge, and are rounded off on either side. There also appear indications of steps up to the level of the area within the castle, and the remains of a wall, which, crossing the terrace from the outer wall, divided the entrance into two parts at its widest end. The inner wall of the castle incloses an area measuring 175 feet north and south, by 180 feet east and west. The centre is without any indication of buildings; but all around, and next to the wall, are the remains of circular inclosures, supposed to have formed the habitable parts of the castle. They are generally about eighteen or twenty feet in diameter, but at the northern side there is a larger apartment thirty by twenty-six.* Castle an Dinas and Caer Bran, both in the same county of Cornwall, exhibit similar vestiges of circular stone walls, containing smaller inclosures. The first is situated on one of the highest hills in the hundred of Penwith; the second on a hill in the parish of Sancred.† A fine specimen of a triple ramparted British camp exists on one of the Malvern Hills, called the Herefordshire Beacon. Of ancient British earth-works also there is a most interesting relic at Tynwald, in the Isle of Man.‡ It is a round hill of earth, cut into terraces, and ascended

The Herefordshire Beacon.

by steps of earth like a regular staircase. The entrance into the area had stone jambs, covered with transverse imposts, fixed by the contrivance called a tenon and mortice, like those at Stone-Henge.

The last-named stupendous monument and similar circles and inclosures in various parts of the kingdom, are evidences of a much higher degree of architectural skill than is displayed either in the domestic or the military erections we have noticed. The application of the principle of the lever must have been known to those by whom such enormous blocks of stone were lifted from the quarry, conveyed to the place where they were to be used, and hoisted and disposed in their present form. It thus appears, that although the towns of the Britons may be likened to the kraals of the Hottentots, their fortresses, castles, and the pillared circles dedicated to the worship of their divinities, or the solemn deliberations of their kings or legislators, are not to be paralleled amongst savages.

With regard to the furniture and interior decora-

CONSTANTINE TOLMAN, Cornwall; consisting of a vast stone 33 feet long, 14½ deep, and 18½ across, placed on the points of two natural rocks. The stone, which is calculated to weigh 750 tons, points due south and north.

tions of the habitations of the Britons, a knowledge of which would throw considerable light upon the degree of civilization to which they had attained, we are completely in the dark. But however poorly furnished the houses of private individuals may have been, it is probable enough that the residences of their kings, their sages, and their chiefs, were not destitute of such comforts and even ornaments or elegancies as their intercourse, first with the Phœnicians, and afterwards with the Gauls, would have procured them, supposing them to have been aboriginal savages, instead of colonists, bearing with them the arts, customs, and manners of the countries from whence they came. Of the handicrafts in which they themselves excelled, that of basket-making or wicker-work has been particularly mentioned by the Roman poets, Juvenal and Martial. The Latin *bascauda*, from whence is the modern basket, appears to have been a British word. Wicker-work was used in the construction of their smaller boats by the Britons; and of this manufacture were made the gigantic idols in which they burned their victims at their religious festivals. Long before the arrival of the Romans, it is obvious that the Britons must have possessed certain implements required for the cutting, smoothing, shaping, and joining of wood.* Besides their houses, they had, as we have already seen, at the time of Cæsar's invasion, not only instruments of husbandry, but carriages both for war and for other purposes. These war-carriages have already been described in our narrative of their protracted contest with their invaders. The Greek and Roman writers mention the British wheel-carriages under the six different names of Benna, Petoritum, Currus or Carrus, Covinus, Essedum or Esseda, and Rheda; and it is thought by some, though per-

* See a great variety of those instruments called celts in the fifth vol. of the Archæologia, p. 106, shaped so as to serve for chisels, adzes, hatchets, &c. Some have been found with cases to them, as if to preserve their edge.

37982

haps without sufficient reason, that each of these terms designated a particular description of carriage. The covinus is supposed to have been the chariot which was armed with a scythe.*

There is no reasonable ground for supposing, as some writers have done, that the ancient Britons possessed any description of navigating vessels, which could properly be termed ships of war. The notion has been taken up on an inference from a passage in Cæsar, or rather from a comparison of several passages, which the language of that writer rightly understood, certainly does not at all authorize. Cæsar gives us in one place an account of a naval engagement which he had with the Veneti of western Gaul, whose ships appear, from his description, to have been very formidable military engines. In a preceding chapter he had informed us, that in making preparations for their resistance to the Roman arms, the Veneti, after fortifying their towns, and collecting their whole naval strength at one point, associated with them for the purpose of carrying on the war, the Osismii, the Lèxobii, and other neighbouring tribes, and also sent for aid out of Britain, which lay directly over against their coast. But it is not said that the assistance which they thus obtained, either from Britain or any other quarter, consisted of ships. It does not even appear that it consisted of seamen; for, although it so happened that the war was terminated by the destruction of the naval power of the Veneti, in the engagement we have just mentioned, preparations had evidently been made in the first instance for carrying it on by land as well as by sea. The supposition that the Britons possessed any ships at all resembling the high-riding, strong-timbered, iron-bound vessels of this principal maritime power of Gaul—provided, amongst other things, Cæsar assures us, with chain cables (*anchoræ, pro funibus, ferreis catenis revinctæ*)—is in violent contradiction to the general bearing of all the other recodred and probable facts respecting the condition of our island and its inhabitants at that period. There is no evidence or reason for believing that they were masters of any other navigating vessels than open boats, of which it may be doubted if any were even furnished with sails. Their common boat appears to have been what is still called the currach by the Irish, and the coracle (cwrwgyl) by the Welsh, formed of osier twigs, covered with hide. The small boats yet in use upon the rivers of Wales and Ireland are in shape like a walnut-shell, and rowed with one paddle. Pliny, as already noticed, quotes the old Greek historian Timæus, as affirming that the Britons used to make their way to an island at the distance of six days' sail in boats made of wattles, and covered with skins; and Solinus states that, in his time, the communication between Britain and Ireland was kept up on both sides by means of these vessels. Cæsar, in his history of the Civil War, tells us that, having learned their use while in Britain, he availed himself of them in crossing rivers in Spain; and we learn from Lucan, that they were used on the Nile and the Po, as well as by the Britons. Another kind of British boat seems to have been made out of a single tree, like the Indian canoes. Several of these have been discovered. In 1736 one was dug up from a morass called Lockermoss, in Dumfries, Scotland. It was seven feet long, dilated to a considerable breadth at one end: the paddle was found near it. Another, hollowed out of a solid tree, was seen by Mr. Pennant, near Rilblain. It measured eight feet three inches long, and eleven inches deep. In the year 1720 several canoes similar to these were dug up in the marshes of the river Medway, above Maidstone; one of them so well preserved as to be used as a boat for some time afterwards. On draining Martine Muir, or Marton Lake, in Lan-

Foreshortened View, showing the End.

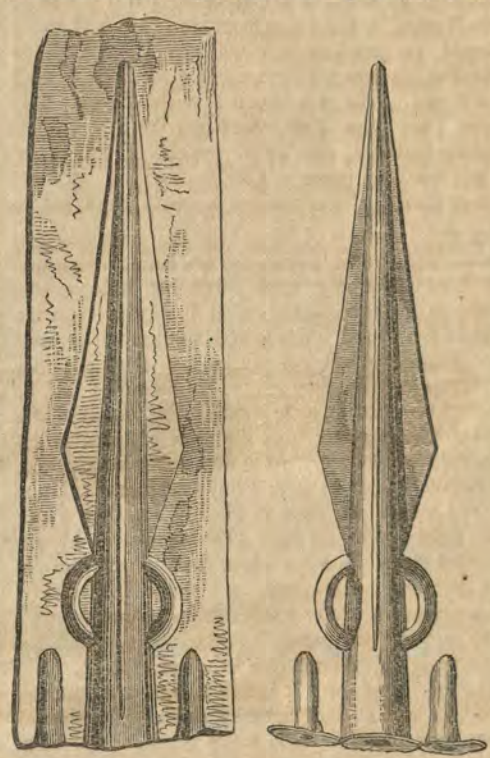
Ancient British Canoes.—Found at North Stoke, Sussex.

cashire, there were found sunk at the bottom, eight canoes, each made of a single tree, much like the American canoes.* In 1834 a boat of the same description was found in a creek near the village of North Stoke, on the river Arun, Sussex. It is now in the British Museum, and measures in length thirty-five feet four inches; in depth one foot ten inches; and in width, in the middle, four feet six inches. There are three bars left at the bottom, at different distances from each other, and from the ends, which seem to have served the double purpose of strengthening it and giving firm footing to those who rowed or paddled the canoe. It seems to have been made, or at least finished, by sharpened instruments, and not by fire, according to the practices of the Indians.†

Although Strabo mentions articles of earthenware among the supplies brought to the inhabitants of the tin islands by the foreign merchants, it is probable that the art of manufacturing certain descriptions of such articles was not unknown to the Britons. The Gauls had numerous and extensive potteries. The British earthenware, however, appears to have been of an inferior description, composed of very coarse materials, rudely formed, before the use of the lathe was known, imperfectly baked, and subject, therefore, to crack by mere exposure to the weather. The ornaments chiefly consisted of the zigzag pattern, and of lines evidently worked by some pointed instrument with the hand, and not formed in a mould. The vases most frequently found are divided by Sir R. Colt Hoare into three kinds. 1. The large sepulchral or funeral urn, which contains the burnt bones of the deceased, sometimes in an upright but more frequently in a reversed position. It is usually a truncated cone, plain, standing mouth downwards in a dish to fit, like a pie dish, worked with zigzags. 2. The drinking cup, most frequently found with skeletons, and placed at the head and feet, of a barrel form, but widening at the mouth, always neatly ornamented with zigzag or other patterns, and holding about a quart in measure: they are supposed to have contained articles of food for the dead. 3. Incense-cups, or thuribula, diminutive, more fantastic in shape and ornaments than the former, frequently perforated in the sides, and sometimes in the bottom, like a cullender. These are supposed to have been filled with balsams and precious ointments, or frankincense, and to have been suspended over the funeral pile.‡

Among the useful arts practised by the ancient Britons, they must be allowed to have had some acquaintance with those relating to the metals, but how much it is not easy to determine. Both Strabo and Diodorus Siculus have briefly noticed their mode of obtaining the tin from the earth. The former observes that Publius Crassus, upon his visit to the Cassiterides, found the mines worked to a very small depth. It may be inferred from this expression, that the only mining known to the natives was that which consisted in digging a few feet into the earth, and collecting what is now called the *stream* tin, from the modern process of washing and separating the particles of the ore thus lodged by directing over their bed a stream of water. No tools of which they were possessed could have enabled them to cut their way to the veins of metal concealed in the rocks. The language of Diodorus supports the same conclusion. He speaks of the tin as being mixed with earth when it is first dug out of the mine; but, from what he adds, it would appear that the islanders knew how to separate the metal from the dross by smelting. After it was thus purified, they prepared it for market by casting it into ingots in the shape of dice. What lead they had was no doubt procured in like manner from the surface of the soil or a very small depth under it. Pliny indeed expressly states that, even in his time, this latter metal was found in Britain in great plenty lying thus exposed or scarcely covered.

There is every reason to believe that some knowledge of the art of working in metals was possessed by the Britons before the Roman invasion. Moulds for spear, arrow, and axe-heads have been frequently found both in Britain and Ireland;* and the discovery in 1735, on Easterly Moor, near York, of 100 axe-heads, with several lumps of metal and a quantity of cinders, may be considered



MOULDS FOR SPEAR-HEADS.

* King's Munimenta Antiqua, vol. i. page 23, &c.
† Archæologia, vol. xxvi. p. 257, &c.

sufficient testimony that at least the bronze imported into Britain was cast into shapes by the inhabitants themselves.* The metal of which the British weapons and tools were made has been chemically analyzed in modern times, and the proportions appear to be, in a spear-head, one part of tin to six of copper; in an axe-head, one of tin and ten of copper; and in a knife, one of tin to seven and a half of copper.†

Axe-Heads, commonly called Celts.

Whatever knowledge the Gauls possessed of the art of fabricating and dyeing cloth, the more civilized inhabitants of the South of Britain, having come originally from Gaul, and always keeping up a close intercourse with the people of that country, may be fairly presumed to have shared with them. The long dark-coloured mantles in which Strabo describes the inhabitants of the Cassiterides as attired, may indeed have been of skins, but were more probably of some woollen texture. The Gauls are stated by various ancient authors to have both woven and dyed wool; and Pliny mentions a kind of felt which they made merely by pressure, which was so hard and strong, especially when vinegar was used in its manufacture, that it would resist the blow of a sword. Cæsar tells us that the ships of the Veneti of Gaul, notwithstanding their superior strength and size, had only skins for sails; and he expresses a doubt as to whether that material was not employed either from the want of linen or ignorance of its use. At a somewhat later period, however, it appears from Pliny that linen cloth was fabricated in all parts of Gaul. The dyes which the Britons used for their cloth were probably extracted from the same plant from which they obtained those with which they marked their skin, namely, the isatis, or woad. "Its colour," says a late writer, "was somewhat like indigo, which has in a great degree superseded the use of it. . . . The best woad usually yields a blue tint, but that herb, as well as indigo, when partially deoxidated, has been found to yield a fine green. . . The robes of the fanatic British women, witches, or priestesses, were black, *vestis feralis;* and that colour was a third preparation of woad by the application of a greater heat."* Woad is still cultivated for the purposes of dyeing in France, and also, to a smaller extent, in England.

Woad—(Isatis Tinctoria).

Some of the facts stated above would seem to afford us reason for suspecting that Britain was better known even to the Roman world before the two expeditions of Cæsar than is commonly supposed, or than we should be led to infer from Cæsar's own account of those attempts. We may even doubt whether he was himself as ignorant of the country as he affects to have been. He may very possibly have wished to give to his achievement the air of a discovery as well as of a conquest. Tacitus, as we have seen, is disposed to claim for Agricola, a century and a half later, the honour of having first ascertained Britain to be an island, although even Cæsar professes no doubt about that point; and from the language of every preceding writer who mentions the name of the country, its insular character must evidently have been well known from time immemorial. The Romans did nothing directly, and, notwithstanding all their conquests, little even indirectly in geographical discovery; almost wherever they penetrated the Greeks or the orientals had been before them; and any reputation gained in that field would naturally be valued in proportion to its rarity. But however this may be, Cæsar's invasion certainly had the

* Borlase's Cornwall, p. 287.

† Meyrick's Original Inhabitants, and Philosophical Transactions for 1796, p. 395, &c.

* Britannia after the Romans, p. 56.

immediate effect of giving a celebrity to Britain which it had never before enjoyed. Lucretius, the oldest Roman writer who has mentioned Britain, is also, we believe, the only one in whose works the name is found before the date of Cæsar's visit. Of the interest which that event excited, the Letters of Cicero, to some passages of which we have already referred, written at the time both to his brother Quintus, who was in Cæsar's army, and to Atticus and his other friends, afford sufficient evidence. In the first instance, expectations seem to have been excited that the conquest would probably yield more than barren laurels; but these were soon dissipated. "It is ascertained," Cæsar writes to Atticus, before the issue of the expedition was yet known at Rome, "that the approaches to the island are defended by natural impediments of wonderful vastness (*mirificis molibus*); and it is known too by this time that there is not a scruple of silver in that island, nor the least chance of booty, unless it may be from slaves, of whom you will scarcely expect to find any very highly accomplished in letters or in music."* So, also, in the epistle immediately following to the same correspondent, he mentions having had letters both from his brother and from Cæsar, informing him that the business in Britain was finished, and that hostages had been received from the inhabitants; but that no booty had been obtained, although a pecuniary tribute had been imposed (*imperata tamen pecunia*).

Although the island was not conquered by Cæsar, the way was in a manner opened to it, and its name rendered ever after familiar, by his sword and his pen. Besides the reduction of Gaul, which he effected, removed the most considerable barrier between the Romans and Britain. After that, whether compelled to receive an imperial governor or left unattacked, it could not remain as much dissociated from the rest of the world and unvisited as before. A land of Roman arts, letters, and government,—of Roman order and magnificence, public and private,—now lay literally under the eyes of the natives of Britain; and it was impossible that such a spectacle should have been long contemplated, and that the intercourse which must have existed between the two closely approaching coasts could have long gone on, without the ideas and habits of the formerly secluded islanders, semi-barians themselves and encompassed by semi-barbarians, undergoing some change. Accordingly Strabo has intimated that, even in his time, that is to say, in the reign of Augustus, the Roman arts, manners, and religion had gained some footing in Britain. It appears also, from his account, that although no annual payment under the obnoxious name of a tribute was exacted from the Britons by Augustus, yet that prince derived a considerable revenue, not only from the presents which were made to him by the British princes, but also by means of what would certainly now be accounted a very decided exercise of sovereignty over the island, the imposition of duties or customs upon exports and imports. To these imposts, it seems, the Britons submitted without resistance; yet they must of course have been collected by functionaries of the imperial government stationed within the island, for it is well known to have been a leading regulation of the Roman financial system that all such duties should be paid on goods exported before embarkation, and on goods imported before they were landed. If the duties were not paid according to this rule, the goods were forfeited. The right of inspection, and the other rights with which the collectors were invested to enable them to apportion and levy these taxes, were necessarily of the most arbitrary description; and they must have been even more than ordinarily so in a country where the imperial government was not established, and there was no regular superintending power set over them. Strabo says that a great part of Britain had come to be familiarly known to the Romans through the intercourse with it which was thus maintained.

All this implies, that the foreign commerce of the island had already been considerably extended; and such accordingly is proved to have been the case even by the catalogue—probably an incomplete one—of its exports and imports which Strabo gives us. Among the former he mentions gold, silver, and iron, but, strangely enough, neither lead nor tin; corn, cattle, skins,—including both hides of horned cattle and the skins and fleeces of sheep,—and dogs, which he describes as possessing various excellent qualities. In those days slaves were also obtained from Britain as they now are from the coast of Africa; and it may be suspected from Cicero's allusion already quoted, that this branch of trade was older even than Cæsar's invasion. Cicero seems to speak of the slaves as a well-known description of British produce. These several kinds of raw produce the Britons appear to have exchanged for articles the manufacture of which was probably of more value than the material, and which were, for the greater part, rather showy than useful. The imports enumerated by Strabo are ivory bridles, gold chains, cups of amber, drinking glasses, and a variety of other articles of the like kind. Still, all these are articles of a very different sort from the brass buttons and glass beads, by means of which trade is carried on with savages.

After the establishment of the Roman dominion in the country, its natural resources were no doubt much more fully developed, and its foreign trade both in the way of exportation and importation, but in the latter more especially, must have assumed altogether a new aspect. The Roman colonists settled in Britain of course were consumers of the same necessaries and luxuries as in other parts of the empire; and such of these as could not be obtained in the country were imported for their use from abroad. They must have been paid for, on the other hand, by the produce of the island, of its soil, of its mines, perhaps of its seas, and by

*Epist. ad Att. iv. 16.

the native manufactures, if there were any of these suited to the foreign market.

The chief export of Roman Britain, in the most flourishing times of the province, appears to have been corn. This island, indeed, seems eventually to have come to be considered in some sort as the Sicily of the northern part of the empire; and in the fourth century we find the armies of Gaul and Germany depending in great part for their subsistence upon the regular annual arrivals of corn from Britain. It was stored in those countries for their use in public granaries. But on extraordinary emergencies a much greater quantity was brought over than sufficed for this object. The historian Zosimus relates that in the year 359, on the Roman colonies situated in the Upper Rhine having been plundered by the enemy, the Emperor Julian built a fleet of 800 barks, of a larger size than usual, which he dispatched to Britain for corn; and that they brought over so much that the inhabitants of the plundered towns and districts received enough not only to support them during the winter, but also to sow their lands in the spring, and to serve them till the next harvest. It is probable also that Britain now supplied the continental parts of the empire with other agricultural produce as well as grain. No doubt its cattle, which were abundant even in the time of Cæsar, frequently supplied the foreign market with carcases as well as hides, and were also exported alive for breeding and the plough. The British horses were highly esteemed by the Romans both for their beauty and their training. Various Latin poets, as well as the geographer Strabo, have celebrated the pre-eminence of the British dogs above all others both for courage, size, strength, fleetness, and scent.* Cheese, also, which many of the British tribes when they first became known to the Romans appear not to have understood how to make, is said to have been afterwards exported from the island in large quantities. The chalk of Britain, and probably also the lime and the marl, seem to have been held in high estimation abroad; and an altar or votive stone is stated to have been found in the seventeenth century at Domburgh, in Zealand, with an inscription testifying it to have been dedicated to a goddess named Nehalennia, for her preservation of his freight, by Secundus Silvanus, a British chalk-merchant (Negociator Cretarius Britannicianus).

We may fairly presume that the trade in the ancient metallic products of the island, tin and lead, was greatly extended during the Roman occupation. It seems to have been then that the tin-mines first began to be worked to any considerable depth, or rather that the metal began to be procured by any process which could properly be called mining. It has been supposed that convicted criminals among the Romans used to be condemned to work in the British mines.† Roman coins, and also blocks of tin, with Latin inscriptions, have been found in the old tin-mines and stream-works of Cornwall. The British Museum contains several pigs of lead stamped by the Romans, which have been discovered in different parts of the country. Britain then, as now,

Pigs of Lead, in the British Museum.

seems to have produced much more lead than all the rest of Europe. But we shall return to this subject presently, when we come to speak of the improvements in the useful arts introduced by the Romans. We have no direct information as to any actual exports of the metals from Britain in the Roman times, and can merely infer the fact from the mention which we find made of them as important products of the country, and from the other evidences we have that they were then obtained in considerable quantities. On these grounds it has been supposed that supplies were in those days obtained from Britain not only of lead and tin, but also of iron, and even of the precious metals. Tacitus expressly mentions gold and silver as among the mineral products of the island.*

The same writer adds that Britain likewise produces pearls, the colour of which however is dusky and livid, but this he thinks may probably be attributed to the unskilfulness of the gatherers, who do not pluck the fish alive from the rocks, as is done in the Red Sea, but merely collect them as the sea throws them up dead. The pearls of Britain seem to have very early acquired celebrity. We have already quoted the tradition preserved by Suetonius about Julius Cæsar having been tempted to invade the island by the hope of enriching himself with its pearls; and what Pliny tells us of the shield studded with British pearls, which he dedicated to Venus, and suspended in her temple at Rome. Solinus affirms that the fact of the pearls being British was attested by an inscription on the shield, which agrees very well with Pliny's expression, that Cæsar wished it to be so understood. The oldest Latin writer, we believe, who mentions the

† Ib. ii. 1523.

* Agric. 12.

British pearls is Pomponius Mela, who asserts that some of the seas of Britain generate pearls and gems. They are also mentioned in the second century by Aelian in his History of Animals, and by Origen in his Commentary on St. Matthew, who, although he describes them as somewhat cloudy, affirms that they were esteemed next in value to those of India. They were, he says, of a gold colour. Some account of the British pearls is also given in the fourth century by Marcellinus, who describes them, however, as greatly inferior to those of Persia. In the same age the poet Ausonius mentions those of Caledonia under the poetical figure of the white shell-berries.* But the British pearls have also been well known in modern times. Bede notices them as a product of the British seas and rivers in the eighth century. There is a chapter upon those found in Scotland in the description of that country prefixed to Hector Boece's History, in which the writer gives an account of the manner of catching the fish in his time (the beginning of the sixteenth century). It is very different from that which Tacitus has noticed, as will appear from the passage, which is thus given in Harrison's English translation :—"They are so sensible and quick of hearing, that although you, standing on the brae or bank above them, do speak never so softly, or throw never so small a stone into the water, yet they will descry you, and settle again to the bottom, without return for that time. Doubtless they have, as it were, a natural carefulness of their own commodity, as not ignorant how great estimation we mortal men make of the same amongst us ; and therefore so soon as the fishermen do catch them, they bind their shells together, for otherwise they would open and shed their pearls, of purpose for which they know themselves to be pursued. Their manner of apprehension is this ; first, four or five persons go into the river together, up unto the shoulders, and there stand in a compass one by another, with poles in their hands, whereby they rest more surely, sith they fix them in the ground, and stay with one hand upon them ; then, casting their eyes down to the bottom of the water, they espy where they lie by their shining and clearness, and with their toes take them up (for the depth of the water will not suffer them to stoop for them), and give them to such as stand next them." The Scotch pearls, according to Boece, were engendered in a long and large sort of mussel, called the horse-mussel. On the subject of the origin of the pearl he follows Pliny's notion. These mussels, he says, "early in the morning, in the gentle, clear, and calm air, lift up their upper shells and mouths a little above the water, and there receive of the fine and pleasant breath or dew of heaven, and, afterwards, according to the measure and quantity of this vital force received, they first conceive, then swell, and finally product the pearl." "The pearls that are so got in Scotland," he adds, "are not of small value ; they are very orient and bright, light and round, and sometimes of the quantity of the nail of one's little finger, as I have had and seen by mine own experience." In his own Description of England, also, written about the middle of the sixteenth century, Harrison notices those still to be found in that part of the island. He accounts for their having fallen into disrepute in a curious way. "Certes," he writes, "they are to be found in these our days, and thereto of divers colours, in no less numbers than ever they were of old time. Yet are they not now so much desired, because of their smallness, and also for other causes, but especially sith church-work, as copes, vestments, albes, tunicles, altar-cloths, canopies, and such trash are worthily abolished, upon which our countrymen superstitiously bestowed no small quantities of them. For I think there were few churches or religious houses, besides bishops' mitres, books, and other pontifical vestures, but were either thoroughly fretted or notably garnished with huge numbers of them." He adds, "I have at sundry times gathered more than an ounce of them, of which divers have holes already entered by nature, some of them not much inferior to great peason (peas) in quantity, and thereto of sundry colours, as it happeneth among such as are brought from the easterly coast to Saffron Waldon in Lent, when for want of flesh stale stinking fish and welked mussels are thought to be good meat, for other fish is too dear amongst us when law doth bind us to use it. They (pearls) are also sought for in the latter end of August, a little before which time the sweetness of the dew is most convenient for that kind of fish which doth engender and conceive them, whose form is flat, and much like unto a lempit. The further north, also, that they be found, the brighter is their colour, and their substances of better valure, as lapidaries do give out." In another place, Harrison mentions, as found in England, what he calls mineral pearls, "which," he says, "as they are for greatness and colour most excellent of all other, so they are digged out of the main land, and in sundry places far distant from the shore." Camden, and his translator, Gibson, have given us an account of pearls found in the river Conway in their time. "The pearls of this river," says the latter, "are as large and well coloured as any we find either in Britain or Ireland, and have probably been fished for here ever since the Roman conquest, if not sooner." The writer goes on to inform us, that the British and Irish pearls are found in a large black mussel; that they are peculiar to rapid and strong rivers; and that they are common in Wales, in the north of England, in Scotland, and some parts of Ireland. They are called by the people of Caernarvonshire, kretyin diliw, or deluge shells. The mussels that contain pearls are generally known by being a little con-

* "Albentes concharum germina baccas;" literally, the white berries, the buds of shells. Ausonius *in Mosella*. This appears to be the origin of the verse "Gignit et insignes antiqua Britannia baccas," quoted by Camden and by other writers after him, from Marbodaeus, a Frenchman of the eleventh century, who wrote a Latin poem entitled "De Gemmarum Lapidumque preciosorum formis, natura, et viribus." Of course a writer of that age can be no authority in this case.

tracted, or contorted from their usual shape. A Mr. Wynn had a valuable collection of pearls, procured from the Conway, amongst which, Gibson says that he noted a stool-pearl, of the form and bigness of a lesser button mould, weighing seventeen grains. A Conway pearl presented to the queen of Charles II., by her chamberlain, Sir Richard Wynn (perhaps of the family of this Mr. Wynn), is said still to be one of the ornaments of the British crown. Camden also speaks of pearls found in the river Irt, in Cumberland. "These," he says, "the inhabitants gather up at low water; and the jewellers buy them of the poor people for a trifle, but sell them at a good price." Gibson adds (writing in the beginning of the last century), that not long since a patent had been granted to some persons for pearl fishing in this river; but the pearls, he says, were not very plentiful here, and were most of the dull-coloured kind, called sand-pearl. Mention is made in a paper in the Philosophical Transactions, of several pearls of large size that were found in the sixteenth century in Ireland; among the rest, one that weighed thirty-six carats.* Pennant (Tour in Scotland, 1769) gives an account of a pearl-fishery then carried on in the neighbourhood of Perth, in Scotland, which, though by that time nearly exhausted, had, a few years before, produced between three and four thousand pounds worth of pearls annually. An eminent naturalist, we observe, has recently expressed some surprise that the regular fisheries which once existed for this native gem should have been abandoned.† The pearl, however, though still a gem of prize, is not now held in the same extraordinary estimation as in ancient times, when it appears, indeed, to have been considered more valuable than any other gem whatever. "The chief and topmost place," says Pliny, "among all precious things, belongs to the pearl."‡

Another product of the British waters, which was highly prized by the luxurious Romans, was the oyster. From the manner in which the oysters of Britain are mentioned by Pliny, their sweetness seems to have been the quality for which they were especially esteemed.* Juvenal speaks of them as gathered at Rutupiæ, now Richborough, near Sandwich.† Pliny, who mentions as among the greatest delicacies of Britain a sort of geese, which he calls chenerotes, and describes as smaller than the anser, or common goose.*

Solinus† celebrates the great store found in Britain of the stone called the gagates, in English the black amber, or jetstone. This mineral, as may be seen from Pliny,‡ was held by the ancients to be endowed with a great variety of medical and magical virtues. Camden mentions it as found on the coast of Yorkshire. "It grows," he says,

"upon the rocks, within a chink or cliff of them; and before it is polished looks reddish and rusty, but after, is really (as Solinus describes it) diamond-like, black, and shining." "Certain it is," says Harrison, "that even to this day there is some plenty to be had of this commodity in Derbyshire and about Berwick, whereof rings, salts, small cups, and sundry trifling toys are made; although that in many men's opinions nothing so fine as that which is brought over by merchants daily from the main." Marbodaeus, however, gives the preference to the jets of Britain over those of all other countries.

The inhabitants of Britain under the Roman government, no doubt carried on traffic with the other parts of the empire in ships of their own; and the province must be supposed to have possessed a considerable mercantile as well as military navy. It is of the latter only, however, that the scanty history of the island we have during the Roman domination has preserved any mention. A powerful maritime force, as we have already had occasion to observe, was maintained by the Romans for the defence of the east, or, as it was called, the Saxon coast; and about the end of the third century we have the first example of an exclusively British navy under the sovereignty of the famous Carausius.* The navy of Carausius must have been manned in great part by his own Britons; and the superiority which it maintained for years in the surrounding seas, preserving for its master his island empire against "the superb fleets that were built and equipped," says a contemporary writer,"† "simultaneously in all the rivers of the Gauls to overwhelm him," may be taken as an evidence that the people of Britain had by this time been long familiar with ships of all descriptions.

Wholly uncultivated as the greater part of the country was when it was first visited by the Romans, it was most probably not unprovided with a few great highways, by which communication was maintained between one district and another. Cæsar could scarcely have marched his forces even so far into the interior as he did, if the districts through which he passed had been altogether without rodas. Rude and imperfect enough these British roads may have been, but still they must have been to a certain extent artificial; they must have been cleared of such incumbrances as admitted of being removed, and carried in a continuous line out of the way of marshes and such other natural impediments as could not be otherwise overcome. Tacitus would seem to be speaking of the native roads, when he tells us that Agricola, on preparing in his sixth summer to push into the regions beyond the Forth, determined first to have a survey of the country made by his fleet; because it was apprehended that the roads were infested by the enemy's forces. The old tradition is, that the southern part of the island was, in the British times, crossed in various directions by four great highways, still in great part to be traced, and known by the names of the Fosse, Watling-street, Ermine-street, and the Ichenild. The Fosse appears to have begun at Totness, in Devonshire, and to have proceeded by Bristol, Cirencester, Chipping Norton, Coventry, Leicester, and Newark, to Lincoln. Watling-street is said to have commenced at Dover, to have proceeded thence through Kent, by Canterbury, to London; then to have passed towards the north, over Hampstead Heath, to Edgeware, St. Alban's, Dunstable, Stoney Stratford, in Northamptonshire, along the west side of Leicestershire, crossing the Fosse near Bosworth, and hence to York and Chester-le-Street, in the county of Durham. Some carry it, in later times, from this point as far as to Lanark and Falkirk, in Scotland; and others even to Caithness, at the extremity of the island. The Ermine-street is understood to have run from St. David's, in Wales, to Southampton, crossing the Fosse between Cirencester and Gloucester. The Ikenild is supposed to have been so called from having begun in the country of the Iceni, on the east coast. It is commonly thought to have crossed Watling-street, at Dunstable, and thence to have taken a north-easterly direction, through Staffordshire, to the west side of the island. The utmost, however, that can be conceded in regard to these roads being of British origin, is, that lines of communication in such directions may have existed in the time of the Britons. It was the Romans, undoubtedly, by whom they were transformed into those elaborate and almost monumental works which their remains declare them to have been. Roads constructed to last for ever were laid down by that extraordinary people, as the first foundations of their empire wherever they planted themselves, and seem to have been considered by them as the indispensable veins and arteries of all civilization. In Britain it is probable that they began their operations with the great native high-roads, the course of which would be at least accommodated to the situation of the principal towns and other more important localities throughout the country. These they no doubt levelled, straightened, and paved, so as to fit them not only for the ordinary purposes of pedestrian and carriage communication, but also for the movements of large bodies of infantry and cavalry, in all weathers and in all seasons. But they formed also many new lines of road, leading from one to another of the many new stations which they established in all parts of the country. Camden describes the Roman ways in Britain as running in some places through drained fens, in others through low valleys, raised and paved, and so broad that they admit of two carts easily passing each other. In this country, as elsewhere, the Roman roads were in great part the work of the soldiery, of whose accomplishments skill in this kind of labour was one of the chief. But the natives were also forced to lend their assistance; and

* See ante, p. 53.

† The Orator Mamertinus, c. xii.; quoted in Britannia after the Romans, p. 10.

we find the Caledonian Galgacus, in Tacitus, complaining, with indignation, that the bodies of his countrymen were worn down by their oppressors, in clearing woods and draining marshes—stripes and indignities being added to their toils. To this sort of work also criminals were sentenced, as well as to the mines. The laws of the empire made special provision for the repair of the public ways, and they were given in charge to overseers, whose duty it was to see them kept in order. The ancient document called the Itinerary of Antoninus, enumerates fifteen routes or journeys in Britain, all of which we may presume were along regularly formed high-roads; and probably the list does not comprehend the whole number of such roads the island contained. In every instance the distances from station to station are marked in Roman miles; and no doubt they were indicated on the actual road by milestones regularly placed along the line.

London Stone.

Of these, the famous London stone, still to be seen leaning against the south wall of St. Swithin's church, in Cannon-street, London, is supposed to have been the first, or that from which the others were numbered, along the principal roads, which appear to have proceeded from this point as from a centre. The Roman roads in Britain have undergone so many changes since their first formation, from neglect and dilapidation on the one hand, and from many repairs which they are known to have received long after the Roman times, and in styles of workmanship very different from the Roman, that the mode in which they were originally contsructed is in most cases not very easy of discovery. One of those which had probably remained most nearly in its primitive condition, was that discovered by Sir Christopher Wren, under the present Cheapside, London, while he was preparing to erect the church of St. Mary-le-Bow. "Here," says the account in the Parentalia, "to his surprise, he sunk about eighteen feet deep through made ground, and then imagined he was come to the natural soil and hard gravel; but upon full examination, it appeared to be a Roman causeway of rough stone, close and well rammed, with Roman brick and rubbish at the bottom for a foundation, and all firmly cemented. This cause way was four feet thick. Underneath this causeway lay the natural clay, over which that part of the city stands, and which descends at least forty feet lower." Wren eventually determined to erect the tower of the church upon the Roman causeway, as the firmest foundation he could obtain, and the most proper for the lofty and weighty structure he designed. Some of the other Roman roads in Britain, however, and especially those connecting some of the lines of military posts, were constructed in a more ambitious style of workmanship than appears to have been here employed—being paved, like the famous Appian way and others in Italy, with flat stones, although of different sizes, yet carefully cut to a uniform, rectangular shape, and closely joined together. Some of our great roads still in use were originally formed by the Romans, or were used at least in the Roman times. One example is the great western road leading to Bath and Bristol, at least for a considerable part of its course.*

We may here most conveniently notice the subject of the description of money which appears to have been in use among the ancient Britons. Cæsar's statement is, distinctly, that they had no coined money. Instead of money, he says they used pieces either of bronze or of iron, adjusted to a certain weight. There is some doubt, owing to the disagreement of the manuscripts, as to whether he calls these pieces of metal rings, or thin plates, or merely tallies or cuttings (taleæ); but the most approved reading is rings. A curious paper on this ring-money of the Celtic nations has been lately printed by Sir William Betham.† Specimens of this primitive currency, according to the writer, have been found in great numbers in Ireland, not only of bronze, but also of gold and silver. Sometimes the form is that of a complete ring, sometimes that of a wire or bar, merely bent till the two extremities are brought near to each other. In some cases the extremities are armed with flattened knobs, in others they are rounded out into cup-like hollows. Sometimes several rings are joined together at the circumferences; other specimens consist of rings linked into one another. The most important pe-

* In the 'United Service Journal' for January, 1836, is an account of a Survey of the Roman Road from Silchester to the Station on the Thames, called Pontes, lately made by the officers studying at the Senior Department of the Royal Military College.

† Papers read before the Royal Irish Academy, 4to., Dublin, 1836.

culiarity, however, distinguishing these curious relics, and that which the writer conceives chiefly proves them to have really served the purposes of money, is, that upon being weighed, by far the greater number of them appear to be exact multiples of a certain standard unit. The smallest of gold which he had seen, he says, weighed twelve grains, or half a pennyweight; and of others, one contained this quantity three times, another five, another ten, another sixteen, another twenty-two, another four hundred and eighty (a pound troy), and another five hundred and thirty-four. The case he affirms to be similar both with those of silver and those of bronze. All, he says, with a very few exceptions, which may easily be accounted for on the supposition of partial waste or other injury, weigh each a certain number of half pennyweights. The smallest specimens even of the bronze ring money are quite as accurately balanced as those of the more valuable metals; and among these bronze specimens, indeed, the author states, that, after having weighed a great many, he has never found a single exception to their divisibility into so many half pennyweights. It would thus appear that the ancient Celtic scale was the same with that which we now call troy weight. The writer conjectures that the Latin uncia, an ounce, is the Celtic word unsha, which he says signifies one-sixth; in which case we must suppose the original integral weight of which the ounce was a fraction, to have been half our present pound troy. "To what remote period of antiquity," he observes, "do these singular facts carry us back! To many ages before the time of Cæsar, or even Herodotus. The latter speaks of the Lydians as the first who coined metallic money, at least six centuries before our era. These are no visionary speculations; we have here the remains and imperishable relics of those early times to verify the whole; and recent investigations and discoveries, in a most singularly convincing manner, come to our aid, by showing that the fresco paintings in the tombs of Egypt exhibit people bringing, as tribute to the foot of the throne of Pharaoh, bags of gold and silver rings, at a period before the exodus of the Israelites." These things, however, are not the only specimens that have been found of the substitutes used by the Britons before the introduction of coined money. Both in barrows and elsewhere there have been occasionally turned up hoards of what has all the appearance of being another species of primitive currency, consisting of small plates of iron, mostly thin and ragged, and without any impression.

Of British coined money, the description which is apparently of greatest antiquity, is that of which the specimens present only certain pictorial figures, without any legends or literal characters. Of this sort of coins a considerable collection was discovered about the middle of the last century, on the top of Carnbre Hill, in Cornwall. Of these, some were stamped with figures of horses, oxen, hogs, and sheep; a few had such figures of animals on one side, and a head apparently of a royal personage on the other. All of them were of gold; and perhaps it was only money made of the more

GROUP OF RING COINS.

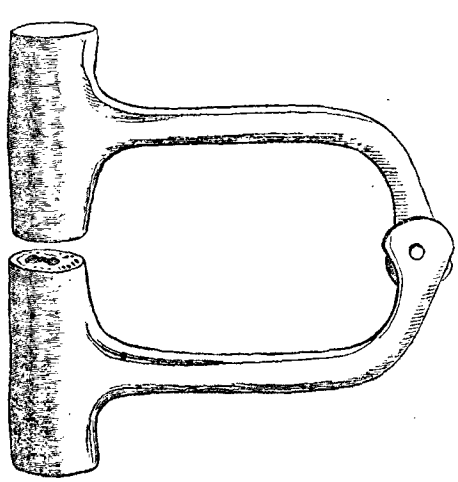
precious metals which it was thought necessary at first to take the trouble of thus impressing. When the convenience of the practice had been experienced, and perhaps its application facilitated, it would be extended to the bronze as well as to the gold and silver currency. Although even that point has been disputed, it may be admitted as most probable that the Carnbre coins were really British money, that is to say, that they were not only current in Britain, but had been coined under the public authority of some one or more of the states of this island. This we seem to be entitled to infer, from the emblematic figures impressed on them, which distinguish them from any known Gallic or other foreign coins, and are at the same time similar to those commonly found on what appears to be the British money of a somewhat later period. The questions, however, of when, where, and by whom were they coined, still remain. Although the figures upon them are peculiar, they still bear a general resemblance to the money, or what has been supposed to be the money, of the ancient Gauls; and as well from this circumstance, as from the whole character of the early British civilization, which appears to have been mainly borrowed from Gaul, we may presume that they were either fabricated in that country, or were at least the work of Gallic artists. It is remarkable that these coins are all formed of pure gold; and Diodorus Siculus informs us, that in no articles which they made of gold did the Gauls mix any alloy with the precious metal. As to their date, it would seem to be subsequent to the time of Cæsar, since, according to his account, the Britons were then unacquainted with the use of coined money of any description; and it may be placed with most probability in the interval between his invasion and that of the Emperor Claudius—a period, as we have already endeavoured to show, during which British civilization must have made a very considerable, though unrecorded, progress.

Besides this merely pictured metallic money,

Ancient British Coins.

however, there exist numerous British coins, or what bear the appearance of being such, which are marked not only with figures of various kinds, but also with legends in Roman characters. One of these, from having the letters *Sego* inscribed upon it, has been attributed to Segonax, who is mentioned by Cæsar as one of the four kings of Kent; but it is obvious that upon such an inference as this, no reliance can be placed. The greater number of the coins in question bear, either in full or abbreviated, the name of Cunobelinus, who is said to have lived in the reign of Augustus. Some of these have the name *Cunobilin* at full length; one has *Cunobelinus Re*, the latter word being probably the Latin Rex; others have the abbreviations *Cun*, *Cuno*, *Cunob*, or *Cunobe*. Several have, in addition, what has been supposed to be the abbreviated name of their place of coinage; being most frequently *Cam*, or *Camu*, for Camulodunum, as it is conjectured; in one instance *Ver*, perhaps for Verulamium; in other cases *No*, or *Novane*, or *Novanit*, of which no probable interpretation has been given. And in addition to these inscriptions, the greater number present the singular word *Tascia*, or *Tascio*, either written at length, or indicated by two or more of its commencing let-

ters. This word has given occasion to much disputation; but perhaps nothing has been proposed on the subject so probable as Camden's suggestion, who conceives that the word, derived apparently from the Latin *taxatio*, signified, in the British language, a tribute, or tribute-money. The figures upon these coins of Cunobeline are very various. Some have a head, probably that of the king, occasionally surrounded with what seems to be a fillet of pearls, in allusion, we may suppose, to the ancient fame of the island for that highly-prized gem; others have a naked full length human figure, with a club over his shoulder; many have the figure of a horse, sometimes accompanied by a wheel, which has been supposed to convey an allusion to the formation of highways, but perhaps is rather intended to indicate the national war-chariot; a crescent, an ear of corn, a star, a comet, a tree, a hog, a dog, a sheep, an ox, a lion, a sphinx, a centaur, a Janus, a female head, a woman riding on an animal like a dog, a man playing on a harp, are some of the representations that have been detected on others One shows what evidently appears to be a workman in the act of making money; he is seated in a chair, and holds a hammer in his hand, while a number of pieces lie before him. About forty of these coins of Cunobeline have been discovered. Many others also exist, which, from the names, or fragments of names inscribed on them, have been assigned to Boadicea, Cartismandua, Caractacus, Venutius, and other British sovereigns. The legends on most of these, however, are extremely obscure and dubious. What is somewhat remarkable is, that no two, we believe, have been found of the same coinage. They are almost all more or less dish-shaped, or hollowed on one side—a circumstance which is common also to many Roman coins, and may be supposed to have been occasioned by the want of the proper guards to prevent the metal from being bent over the edges of the die by the blow of the hammer. The British coins thus inscribed with Roman characters



ROMAN COIN MOULD.

are some of them of gold, some of silver, some of bronze, some of copper. Unlike also to the coins mentioned above, without legends, all of them that are formed of the more precious metals are much alloyed.

It must be confessed that the whole subject of these supposed British coins, notwithstanding all the disputation to which they have given rise, is still involved in very considerable obscurity. It has even been denied that they ever served the purposes of a currency at all. "They are works," observes a late writer, "of no earlier date than the apostasy and anarchy after the Romans. Moreover, they were not money. They were Bardic works belonging to that numerous family of Gnostic, Mithriac, or Masonic medals, of which the illustration has been learnedly handled in Chifflet's 'Abraxas Proteus,' Von Hammer's 'Baphometus,' the Rev. R. Walsh's 'Essay on Ancient Coins,' and (as applicable to these very productions) the Rev. E. Davies's 'Essay on British Coins.' The coins engraved by Dom B. de Montfaucon as remnants of ancient Gaulish money, are productions of similar appearance and of the same class. Paracelsus alludes to them as money coined by the gnomes and distributed by them among men. Their uses have never been known; but I explain them thus. Money is a ticket entitling the bearer to goods of a given value. . . Masonic medals were tickets entitling one initiate to receive assistance from another. It may be objected, that there was no great difficulty of stealing or forging them. True; but to be a beneficial holder of these baubles it was necessary that you should be able to explain the meaning of all the devices upon them. According to the sort of explanation given by the party, it would appear whether he was an authorized holder, and, if such, what rank of initiation he had attained, and consequently to what degree of favour and confidence he was entitled. The names selected to adorn these British medals are unequivocally marked with hatred for the Romans, and love for the memory of those Britons who warred against them; and they imply an exhortation and a compact to expel and exclude the Roman nation from the island."* This view is supported by some plausible arguments; but it is far from being altogether satisfactory. The denial, however, of the title of these coins or medals to be accounted a species of ancient money, is no mere piece of modern scepticism. Camden, though he inclines to a different opinion, expresses himself upon the point with the greatest hesitation. "For my part," he says, "I freely declare myself at a loss what to say to things so much obscured by age; and you, when you read these conjectures, will plainly perceive that I have groped in the dark." "Whether this sort of money passed current in the way of trade and exchange," he observes in conclusion, "or was at first coined for some special use, is a question among the learned. My opinion (if I may be allowed to interpose it) is

* Britannia after the Romans, pp. 218 &c.

this. After Cæsar had appointed how much money should be paid yearly by the Britains, and they were oppressed under Augustus with the payment of customs, both for exporting and importing commodities, and had, by degrees, other taxes laid upon them, namely, for corn-grounds, plantations, groves, pasturage of greater and lesser cattle, as being now in the condition of subjects, not of slaves; I have thought that such coins were first stamped for these uses; for greater cattle with a horse, for lesser with a hog, for woods with a tree, and for corn-ground with an ear of corn; but those with a man's head seem to have been coined for poll money. Not but I grant that afterwards these came into common use. Nor can I reconcile myself to the judgment of those who would have the hog, the horse, the ear, the Janus, &c. to be the arms of particular people or princes; since we find that one and the same prince and people used several of these, as Cunobeline stamped upon his coins a hog, a horse, an ear, and other things. But whether this tribute-money was coined by the Romans, or the provincials, or their kings, when the whole world was taxed by Augustus, I cannot say. One may guess them to have been stamped by the British kings, since Britain, from the time of Julius Cæsar to that of Claudius, lived under its own laws, and was left to be governed by its own kings, and since also they have stamped on them the effigies and titles of British princes."

After the establishment of the Roman dominion in the island, the coins of the empire would naturally become the currency of the new province; and indeed Gildas expressly states that from the time of Claudius it was ordained by an imperial edict that all money current among the Britons should bear the imperial stamp. These expressions, by the by, would rather seem to countenance the opinion, that coined money not bearing the imperial stamp had been in circulation in the country before the publication of the edict. Great numbers of Roman coins of various ages and denominations have been found in Britain. "There are prodigious quantities found here," observes Camden, "in the ruins of demolished cities, in the treasure-coffers or vaults which were hidden in that age, and in funeral urns; and I was very much surprised how such great abundance should remain to this day, till I read that the melting down of ancient money was prohibited by the imperial constitutions." It is highly probable, also, that some of this imperial money was coined in Britain, where the Romans may be presumed to have established mints, as they are known to have done in their other provinces. There are several coins extant both of Carausius and of Allectus, and these it can hardly be doubted were the productions of a British mint. It is remarkable that in the sepulchral barrows there has been found imperial money of the times of Avitus (A.D. 455), of Anthemius (A.D. 467—472), and even of Justinian (A.D. 527—565). Many of the Roman coins, also, or imperial medals struck upon particular occasions, from the time of Claudius, bear figures or legends relating to Britain, and form interesting illustrations of the history of the island.*

We now proceed to notice shortly the chief improvements in the necessary or useful arts for which the Britons appear to have been indebted to their Roman conquerors.

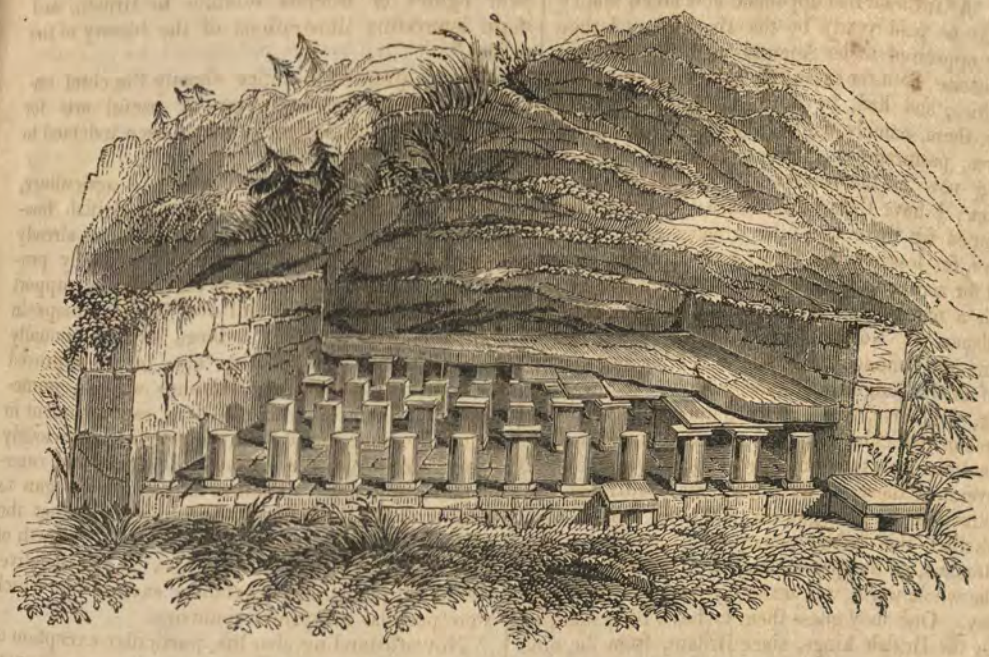
The Romans, themselves devoted to agriculture, eagerly encouraged and assisted the British husbandmen; and we, therefore, as has been already noticed, find the island eventually not only producing a sufficient quantity of corn for the support of its own inhabitants and the Roman troops in occupation, but affording a large surplus annually for exportation. In addition also to an improved and extended tillage, the Romans appear, immediately on their obtaining a firm establishment in Britain, to have introduced the practice, previously scarcely known to the natives, of useful and ornamental gardening. Tacitus tells us they began to plant orchards, and found, by experience, that the soil and climate were favourable to the growth of all kinds of fruit trees except the vine and the olive, and of all plants and vegetables save a few which were peculiar to warmer countries.

Notwithstanding also his particular exception of the vine, it is said that permission was granted long afterwards by the Emperor Probus to plant vines and to make wine in Britain, and that, if so, it was not granted in vain, appears probable from the fact that the vine was certainly flourishing here in the time of the Saxons; the continual mention of vineyards in their wills and deeds affording us indisputable evidence of its general cultivation.

On the settlement of the Romans a change of course took place in the architecture of the British houses and towns, for the commencement of which the country appears to have been indebted to the policy of Agricola, the most excellent of the Roman governors. "That the Britons," says Tacitus, "who led a roaming and unsettled life, and were easily instigated to war, might contract a love of peace and tranquillity by being accustomed to a more pleasant way of living, he exhorted and assisted them to build houses, temples, courts, and market-places. By praising the diligent and reproaching the indolent, he excited so great an emulation amongst the Britons, that after they had erected all those necessary edifices in their towns, they proceeded to build others merely for ornament and pleasure, such as porticoes, galleries, baths, banqueting-houses, &c."

Giraldus Cambrensis has left us an account of the remains of the city of Caerleon, in Wales, as he beheld it himself in the twelfth century. "It was," he says, "elegantly built by the Romans, with brick walls. Many vestiges of its ancient splendour still remain, and stately palaces which formerly, with the gilt tiles, displayed the Roman grandeur. It was first built by the Roman nobility, and adorned with sumptuous edifices, with a lofty

* See upon this subject, "The Coins of the Romans relating to Britain," by J. G. Akerman, 12mo. Lond. 1836.



REMAINS OF A ROMAN HYPOCAUST, OR SUBTERRANEAN FURNACE, FOR HEATING BATHS, AT LINCOLN

PART OF A ROMAN WALL, OR THE SITE OF THE ANCIENT VERULAM, NEAR ST. ALBAN'S.

tower, curious hot baths, temples now in ruins, and theatres encompassed with stately walls, in part yet standing. The walls are three miles in circumference, and within these, as well as without, subterraneous buildings are frequently met with, as aqueducts, vaults, hypocausts, stoves, &c."

Matthew Paris also, in his 'Lives of the Abbots,' mentions the numerous interesting remains of Roman architecture discovered near St. Alban's, at the ancient Verulam, by two abbots, previous to the Norman Conquest, and consisting of dilapidated temples, subverted columns, altars, idols, and the foundations of a large palace.

The more recent discoveries of these Roman British ruins it would be endless here to enumerate and useless to describe, as there appears to have

been nothing to distinguish them from those of the Romans themselves; we have however the authority of one of the best informed writers on the subject, that "nothing *very good* of Roman work ever existed in Britain." . . . . "All the fragments of architecture which have been discovered, whether large or small, whether the tympanum of a temple as found at Bath, or small altars as found in many places, I believe," says Mr. Rickman,* "were all deficient either in composition or in execution, or in both, and none that I know of have been better, if so good, as the debased work of the Emperor Diocletian in his palace at Spalatro. With these debased examples we cannot expect that the inhabitants of Britain would (while harassed with intestine warfare) improve on the models left by the Romans."

"It is not now to be ascertained," he continues, "whether any examples of the actual use of columns, with an architrave incumbent, were left by the Romans, but we have various examples of the plain arch with a pier. As a specimen, the north gate of Lincoln, now used, as it was many centuries ago, for a gate, is perhaps the most perfect. This plain square pier and a semicircular arch I believe to have been imitated in the Saxon buildings; and thus I find actually now a part of Brixworth Church with a bond tier of what we call Roman brick (*i. e.* flat tiles) carried through the work."

The use of mortar, plaster, and cement, of the

Roman Arches forming Newport Gate, Lincoln, as it appeared in 1792.

Restoration of the Roman Arch forming Newport Gate, Lincoln

various tools and implements for building, the art of making the flat tiles abovementioned, and all things connected with masonry and bricklaying, as known and practised by the Romans, must of course, in the progress of these works, have been communicated to their new subjects; and it appears that, by the close of the third century, British builders had acquired considerable reputation. The panegyrist Eumenius tells us that when the Emperor Constantius rebuilt the city of Autun, in Gaul, about the end of the third century, he brought the workmen chiefly from Britain, which very much abounded with the best artificers.

We have already mentioned the labours of the Romans in the improvement of the old roads of the country, and the formation of many new ones. Their attention was at the same time given to the working of the valuable mines throughout the island. The primitive mode of procuring the various metals, by searching the beds of rivers and the depths of valleys, or extracting protruding lumps of ore from fractured lodes in the fissures of the mountains, was replaced by the art of mining. A beautiful specimen of the Roman mode of driving levels exists at a place called Pynsaint, in the parish of Caeo, Caermarthenshire.

In the British Museum, as previously stated, are preserved several pigs or masses of British lead, one of which has the name of the Emperor Domitian inscribed on it, another that of the Emperor Hadrian, and a third bears that of a private individual. "These pigs or oblong masses," observes a late writer, "afford undoubted evidence that the lead-mines of Derbyshire and its neighbourhood were worked in the Roman time. The inscriptions also, which they bear, usually indicating the emperor in whose time the metal was obtained, confirm the testimony of Pliny, who says, 'that in Britain lead is found near the surface of the earth in such abundance that a law is made to limit the quantity which shall be taken.' It was therefore necessary in the royal mines to mark the lead with the emperor's name. In a few instances such pigs apparently bear the name of a private proprietor, but all show that the article was under fiscal regulation, which accounts for the form in which the lead was cast; the inscription, and sometimes a border which surrounds it, always covering the upper area of the piece to its full extent."*

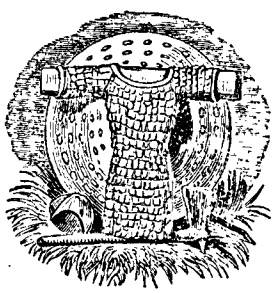
CHAPTER V.

THE HISTORY OF LITERATURE, SCIENCE, AND THE FINE ARTS.



HIS division of our history will contain an account of the state and progress under each period of those higher kinds of knowledge and skill, which are distinguished from the arts treated of in the preceding chapter, by not being directly contributory to the sustenance or physical accommodation of life, but having in view, at least immediately and in the first instance, the exercise, gratification, and improvement of the intellectual faculties, and of those other powers and tastes which peculiarly constitute our humanity, and the general exaltation and embellishment of the social condition. The intellectual character of the time; the branches of learning and science that were chiefly cultivated in our own country and elsewhere, and the manner in which they were cultivated; the schools, colleges, and other institutions for the maintenance or diffusion of erudition and philosophy that existed in these islands; the state and progress of the national language; the more eminent literary and scientific names by which the age was adorned; the great literary works that were produced, and the scientific discoveries that were made; and finally, the state of the fine arts of music, painting, engraving, &c., and of the popular taste,—will all fall under this part of our survey. We need scarcely remark, that these things are much more than the mere ornamental flower and crown of our civilization; they are the very strength of its fibres, and the main element of its growth and expansion; for, while it is true that the exclusively useful arts both naturally originate learning and the fine arts, and form the indispensable basis and support without which they could neither flourish nor exist, it is equally true that the latter, in the end, amply repay the debt, and that the sure effect of the advance of every form of intellectual culture is to extend or consolidate the fabric of that other prosperity which rests upon the operations of manual, mechanical, and mercantile industry. And, indeed, what is the worth to a nation of the highest state of manufacturing and commercial greatness, if it do not at the same time assert to itself a high place in regard to those tastes and pursuits which can alone prevent the pursuit of wealth from being at once the most stupid and the most debasing of all idolatries?

The title of the chapter, in the strictest acceptation of its terms, is scarcely applicable to what we shall have to state in regard to the present period, when literature, science, and the fine arts can scarcely be said to have yet had their birth in our island. At all events, whatever existed in those remote times deserving the name of learning or scientific knowledge, never having been committed to writing, and having consequently perished with the general subversion of the order of things then established, cannot be regarded as having been even the beginning or rudimental germ of that which we now possess. The present literary civilization of England dates its commencement only from the next, or Saxon period, and not from a very early point in that.

A learned writer of the last century commences a "Literary History of the Britons before the Arrival of Cæsar," by gravely informing us that "King Samothes was the first who established a school in this island for instructing the Giants in arts and sciences."* We shall not carry our review quite so far back, but leaving Samothes and his giants at their studies undisturbed, shall content ourselves with taking up the history of learning in Britain from the days of the race of people of ordinary dimensions who were found inhabiting the island on its invasion by the Romans.

At this time, as has been already shown, the south of Britain was occupied by a population which, although divided into many distinct tribes, bore throughout the appearance of being of Gallic origin. In particular, we are expressly informed that the language of Britain differed very little from that of the Gaul. Some of the British tribes seem to have come from Celtic, and others from Belgic Gaul; but it is probable, as indeed Strabo distinctly assures us, that the Celts and the Belgians spoke merely two slightly differing dialects of the same tongue. The evidence of the most ancient names of localities throughout the whole of South Britain confirms this account; everywhere these names appear to belong to one language, and that the same which is still spoken by the native Irish and the Scotch Highlanders; the latter of whom call themselves, to this day, Gael or Gauls.

* Primus qui scholam ad instruendos Gigantes in artibus et scientiis erexit, erat Rex Samothes, qui, ex Armenia per Galliam profectus, ad litora Britanniæ appulit, anno post diluvium CCLII., &c. Rev. et Doct. V. Davidis Wilkinsii Præfatio, Historiam Literariam Britannicorum ante Cæsaris Adventum complectens, apud Bibliothecam Britanno-Hibernicam, auctore Thoma Tannero; fol., Lond, 1748.

The same evidence goes to prove that this Gallic tongue was then the popular speech in the part of the country now called Wales, as well as throughout the rest of south Britain; for the oldest names of places in Wales are not Welsh but Gaelic. Nor does the peculiar dialect of Cornwall appear to have been at this time known any more than its sister Welsh, in the southern parts of the island. The Celtic or Gaelic was also undoubtedly the language of the great body of the people of Ireland. The tribes by whom North Britain was occupied, on the other hand, seem to have been for the greater part of German or Scandinavian extraction; and, if so, they must be supposed to have spoken a Teutonic dialect. But in the absence of all direct evidence, historical, traditional, or monumental, the point is one upon which it is impossible to affirm anything with confidence. As far as the topographical nomenclature of the country affords us any light, it would seem to indicate that the greater part of modern Scotland was anciently occupied by a people speaking a language very nearly allied to the present Welsh.

It is with the Britons of the south exclusively, however, that we are now concerned; for among these only have we reason to believe that any kind of learning or scientific knowledge whatever existed at the time to which our inquiry relates. Among the South Britons* there was undoubtedly established a class of persons, forming a clergy, not only in the modern, but in the original and more extensive signification of the term; that is to say, a body of national functionaries intrusted with the superintendence over all the departments of learning.* The Druids were not merely their theologians and priests, but their lawyers, their physicians, their teachers of youth, their moral and natural philosophers, their astronomers, their mathematicians, their architects, their musicians, their poets, and in that character, no doubt, also their only historians. To them, in short, were left the care and control of the whole intellectual culture of the nation.

It is most probable that, in discharging this duty, the Druids proceeded upon the principle of imparting none of their knowledge except to such as they trained up to be members of their own body. The state of society would scarcely admit of any diffusion of their instructions among the people at large; and the genius of their system, as far as it can be detected, appears to have been wholly opposed to any such lavish communication of that to which they owed all their ascendancy over their fellow-countrymen. To them knowledge was power, not only in the sense in which it is so to every individual in the possession of it, as enabling him to do those things the way of doing which it teaches, but besides, and to a much larger extent, as putting into their hands an instrument of authority and command over all around them. This latter advantage, unlike the former, they could not share with others without leaving less of it for themselves; its value lay in its exclusiveness. They naturally enough, therefore, no more thought of communicating their knowledge to the multitude, than people would now think of so communicating their money or their estates.

Yet their institution seems to have had the important merit of being no mere hereditary oligarchy, or other close corporation, but of being open to all who chose to undergo the requisite preparatory training, and of being accustomed in this way to sustain itself by constant drafts from the mass of the nation. Although the point has been disputed, there is no evidence for the supposition that the Druidical rank was a hereditary dignity. We know that the chief Druid obtained his place by election; and it does not seem likely that this would have been the case if the institution generally had been founded upon the hereditary principle. The Druidical clergy appear rather to have been a body of the same sort with the clergy of any modern Christian church; that is to say, consisting not of the members of particular families, but of persons educated to the profession from any of all the families in the land. It may be assumed, however, that they were principally derived from the more opulent or honourable classes. Cæsar describes the young men who—some of their own accord, others sent by their parents and relations—resorted to the Druids of Gaul to obtain instruction in their system, and to be trained to become members of their body, as very numerous. Pomponius Mela speaks of their pupils as consisting of the most noble individuals of the nation.

In regard to the particular studies in which these crowds of pupils were exercised, our information, as might be expected, is very unsatisfactory. Both Cæsar and Mela state the fact of their sometimes remaining twenty years under tuition; and the former reports that they were said in the course of that time to learn a great number of verses. Cæsar adds, as has been detailed in a former chapter nearly in his own words, that besides the theological instruction which they imparted, the Druids instructed their scholars in many things respecting the heavenly bodies and their motion, the magnitude of the universe and the earth, and the nature of things,—the last phrase designating, we may suppose, a sort of mixed course of physics and metaphysics.

All these instructions, it seems, they communicated orally, the employment of the art of writing being dispensed with for two reasons,—first, that the things taught might be more secure from the chance of coming into the possession of the multitude or the uninitiated; secondly, for the sake of better exercising the memory of the learners. Cæsar expressly informs us, however, that the Druids were acquainted with letters, and used them on all common occasions. The characters which they used, however, would hardly seem to have been those of the Greek alphabet, as the common reading of the passage asserts, seeing that, inde-

* Coleridge on the Constitution of the Church and State, pp. 46, &c.

pendently of other objections to that reading, we find Cæsar upon one occasion in Gaul, when he had a letter to dispatch to some distance which he was afraid might fall into the hands of the natives, writing it in the Greek language, in order that they might not be able to read it. It has been suggested, indeed, that the Druids might use the Greek letters, or letters resembling those of the Greek alphabet, without understanding the Greek tongue. It is a curious circumstance that in the number and powers of the letters, the Celtic alphabet, which has been used from time immemorial in Ireland, exactly corresponds with the original Greek alphabet said to have been brought by Cadmus from Phœnicia, although the ancient forms of the former have been exchanged in modern times for those of the Saxon characters expressing the same sounds. The Druids, therefore, may have obtained possession of letters resembling those of the Greeks without having been indebted for them to that people. The Gallic God of Eloquence, as we learn from Lucian, was called Ogmius; and it is remarkable that certain ancient inscriptions in an unknown character found engraven upon the rocks and elsewhere in Ireland, have always been known among the people by the name of Ogam or Ogma. This coincidence would seem to warrant us in inferring a connexion between the ancient Celtic eloquence and the use of letters.

The art of eloquence was no doubt assiduously cultivated and held in the highest honour both by the Druids and by the other leading personages among the Celtic nations. In the state of society which then subsisted this was the most powerful instrument for ruling the popular mind, as it still is among the islanders of the South Sea and the Indians of America, in a much less advanced social condition. Among both the Gauls and the Britons we read of displays of oratory in all their public proceedings. The debates of their councils and the direction of their armies alike demanded the exercise of this popular accomplishment. The harangues delivered on certain memorable occasions by Galgacus, Boadicea, and other British chiefs, have been preserved to us by the Roman writers. Tacitus has depicted the Druids of Mona, when that sanctuary was attacked by the Roman general Suetonius, rushing, with burning torches outstretched before them, through the ranks of their armed countrymen arrayed to repel the invaders, and inflaming their courage by pouring forth frenzied prayers with their hands uplifted to heaven. On other occasions, according to Diodorus Siculus, they would evince their powers of persuasion by throwing themselves between two bodies of combatants ready to engage; and by the charm of their words, as if by enchantment, appeasing their mutual rage, and prevailing upon them to throw down their arms. In the administration of the laws also, and in the celebration of their religious solemnities, they would no doubt often have occasion to address the people. The artificial mounts called *Carnedds*, still remaining in Anglesey and in other parts of Wales, are supposed, as has been already noticed, to have formed the stations from which they were wont to deliver their regular instructions and admonitions to the listening crowd. The account which Lucian gives of the manner in which their god Ogmius was represented by the Gauls shows forcibly the high estimation in which the art was held over which he was supposed to preside. The epithet of Ogmius, or the God of Eloquence, was given by them to Hercules, whose matchless strength, they finely conceived, did not lie in his thews and sinews, but in the power of his persuasive words, by which he took captive the reason and subdued the hearts of all men;—a thought which we might almost call an anticipation of the striking and beautiful expression of Burke when he described the common mother tongue of Englishmen and Americans as uniting the two nations by "a tie lighter than air, but stronger than iron." The Gauls accordingly painted their Hercules Ogmius as an old man surrounded by a great multitude of people, who seemed attached to him in willing subjection by slender chains reaching from his tongue to their ears. They made him old, they said, because the richest and strongest eloquence was that of age; and it might also be because they in this way the more distinctly showed that it was not by bodily strength he effected the subjugation of his fellow-men. This allegory, it may be added, both in its conception and in the manner in which it was represented to the senses, evinces a very considerable advance in civilization and intellectual culture, and would be enough of itself to place these Celtic nations of antiquity in a different category altogether in these respects from the modern savage communities with which they have sometimes been compared.

Poetry, and its then inseparable accompaniment, Music, were doubtless also cultivated by the British and Gallic Druids, or by that particular division of their body called the Bards. It was, as we have already related, the especial office of these bards, whom Strabo designates by the epithet of Hymners, to celebrate in verse the praises both of the gods and heroes of their nation. Their compositions would thus contain all that was by any artificial process preserved from oblivion of the national history. Their recitations were most probably chanted to the accompaniment of some musical instrument resembling the ancient lyre or the modern harp.

Of the Theology of the Druids a sufficiently full account has already been given. This formed not only the chief department of the Druidical learning, but that with the spirit of which all the rest of their learning was impregnated. Their law, their medicine, their ethics, their astronomy, their system of the physical constitution of the universe, were all accommodated to their theological doctrines, or, to speak more correctly, were all only so many parts of their theology. Of their

views and the extent of their knowledge in all of these sciences, accordingly, we have already had occasion to detail most of the few particulars that are known in explaining their religious system. A few words may be added however on one or two of the branches of their physical knowledge.

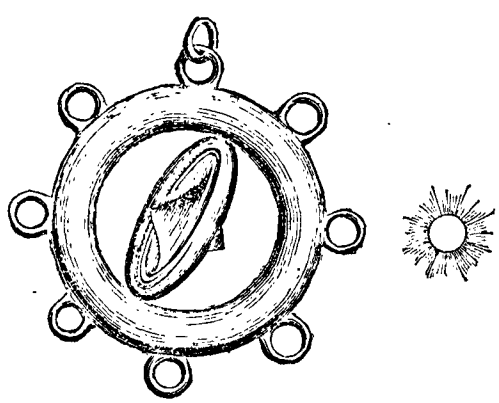
Their medicine seems to have been in its general character, and in most of its professions and practices, a medley of their all alike vain and delusive theology, astrology, divination, and magic, and must have owed the greater part of any efficacy that may have belonged to it to its mere power over the imagination. But they seem also to have been possessed of a limited materia medica, and may even have known some useful secrets respecting the preparation or administration of simples of which we are at present ignorant. Pliny has told us of several herbs which were venerated by the Druids of Gaul for their supposed medicinal virtues, and were applied by them to cure various diseases. We have already quoted his account of the sacred character and moral influences attributed by them to the mistletoe. This plant, which they called by a name signifying all-healing, would seem to have been also their sovereign remedy for most bodily disorders. The mistletoe is said to have been found useful in modern times in cases of epilepsy.* Another medical herb of the Druids was what Pliny calls the selago, and describes as resembling savin, and which has been supposed to be a species of hedge-hyssop. This, too, they regarded as an excellent protection against diseases in general, and its smoke as particularly salutary for ailments of the eyes. Another which he mentions was the samolus, or marsh-wort; this they administered to cattle as well as to human patients. But of all vegetable productions, with the exception only of the mistletoe itself, that which they held in the highest estimation seems to have been the vervain. It is described, with the usual mixture of medical and talismanic attributes, as of efficacy to enable those who anointed themselves with it to obtain the objects of their wishes, as having the power to repel fevers, to conciliate friendships, and to cure every disease. Mixed with wine, it was good against serpents. Very little reliance however was placed by the Druidical physicians upon the merely natural properties of these precious plants. Everything depended upon the ceremonial with which they had been gathered. Some were to be cut from their stalks with an instrument of iron, others were to be plucked by the hand; some were to be gathered by the left hand, others by the right; some while the sun was shining, others in the moonlight, others in the absence of both these luminaries and under the ascendancy of some appropriate star. In some cases the person who went culling was to be attired in white; in others he was to go barefooted; in others, fasting.* All these minute formalities, in addition to their main purpose of impressing the seal of religion upon everything, would have the secondary advantage of affording a convenient shelter for the credit of the drug and the doctor in all cases in which the prescription failed of its promised effect; the ready explanation would be some neglect or irregularity in these ceremonial observances. Some knowledge of real value however may, as we have said, have been hidden under all this delusion and imposture. If the Druids possessed any recondite knowledge whatever (and there can be no doubt that they possessed a great deal), an intimate acquaintance with those productions of the earth by which they were surrounded in the woodland retreats where they spent so much of their studious lives can hardly be denied to them. The few scattered notices in Pliny of their medicine and botany have evidently no pretensions to be considered a full account of their knowledge in these sciences; and it is probable enough that his details may be in many respects as erroneous as they are obviously fragmentary and imperfect. We have seen that Cicero testifies to the extensive information possessed by one of the fraternity in all that the Greeks called physiology, that is, natural science in general. It may also be presumed that, practised as they were in the sacrifice both of brute and of human victims, the Druids could hardly fail to have attained a good deal of anatomical knowledge; but as to whether they made this available either in their medical practice or in any operations of surgery; we have no information.

The branch of science respecting the cultivation of which in these islands in early times we have the most direct historical testimony, and also perhaps the best corroborative evidence of another kind, is that of astronomy. Here, in an especial manner, we find science springing out of, and taking the form almost of a part of, the national religion, if indeed we ought not rather to regard the religion as the daughter of the science, and to suppose the worship of the sun, moon, and stars as divinities, to have been originally merely the popular exhibition made of their discoveries by the sages who studied the movements of these celestial bodies. Wherever, at all events, this particular species of idolatry prevailed, the observation of the celestial motions, in other words, the study of astronomy, appears to have been blended with it; and no doubt can be entertained that, whether it was so in the first instance or not, many scientific truths came eventually to be hieroglyphically signified both in the mythology and in the ceremonial forms of the superstition. Ingenious speculators have endeavoured to detect an astronomical meaning in the disposition of the stones of Stonehenge and Avebury, and of other similar Druidical or

* See Dissertation on the Mistletoe, by Sir John Colbatch, 1729; and Treatise on Epilepsy, and the Use of the Viscus Quercinus, or Mistletoe of the Oak in the Cure of that Disease, by Henry Fraser, M.D., 1806.

* For the particulars with regard to each plant see the following passages in Pliny's Natural History:—on the Mistletoe, xvi. 95; on the Selago, xxiv. 62; on the Samolus, xxiv. 63; on the Vervain, xxv. 59.

supposed Druidical temples. The Irish Round Towers are also conjectured, in combination with their design as sacred or emblematical monuments, to have served the purpose of observatories or watch-towers of the heavens. They have generally, near the top, four openings or windows facing the four cardinal points.* Both Cæsar and Mela (apparently copying him) bear testimony, in passages which we have already had occasion to quote, to the reputation of the Gallic Druids for an acquaintance both with the movements and the magnitudes of the heavenly bodies. We are not aware, however, of any evidence for the supposition, although not unlikely in itself, that, in addition to its general religious application, the science of astronomy was cultivated by these priests as being imagined to afford them the means of looking into futurity, or, in other words, for astrological purposes, unless we are to consider so much to be intimated by the expression of Mela, who mentions their profession of being able to tell the intentions of the gods immediately after having informed us of their knowledge of the motions of the stars, as if their divination had been a part of their astronomy. Another circumstance that in all the ancient ceremonial religions tended to maintain an intimate alliance between religion and astronomical science, was the necessity of some skill in the latter for the regulation of the various annual festivals. Such festivals, as we have seen, constituted a remarkable feature of the Druidical system of worship. The slight notices which the classical writers have preserved would lead us to infer that among the Gauls and Britons, and also among the Germans, all their periods were made to depend upon the movements of the moon. Even what Tacitus has recorded of the Germans and Cæsar of the Gauls, that they reckoned time not by days but by nights, would favour this supposition. We find both nations, also, holding their great solemnities always under some particular aspect of the moon; the Germans, according to Tacitus, at the time of the new or full moon; the Gauls, as Pliny informs us, when that luminary was six days old. From the sixth day of the moon, also, according to Pliny, the Druids began the reckoning not only of their months and years, but likewise of their great cycle, which he says was a period of thirty years. It is remarkable that in the description given by Diodorus Siculus from Hecatæus of the wonders of the Hyperborean Isle, which has been supposed to be Britain or Ireland, the cycle of nineteen years, called the cycle of the moon, because after that number of solar revolutions, the relation of the moon's place in the heavens to that of the sun becomes the same as it was at the commencement of the period, is mentioned in such a manner as to seem to indicate that it was applied as the great regulator of the national religious calendar. The Hyperboreans believe, the historian tells us, that Apollo descends to their isle at the end of every nineteen years, and plays upon the harp, and sings and dances all the night from the vernal equinox to the rising of the Pleiades (about the autumnal equinox), as if rejoicing in the honours rendered to him by his votaries. The knowledge of the lunar cycle, however, would imply a nearly correct knowledge of the solar year; and that also, accordingly, both upon this and upon other grounds, has been claimed for the ancient British and Irish astronomers. The passage in Diodorus has even been adduced as sanctioning the supposition that their observation of the heavenly bodies may not have been unassisted by optical instruments. The ancient authorities from whom Diodorus copied his account affirmed, it seems, that in this Hyperborean isle the moon appeared as if it were near to the earth, and exhibited distinctly protuberances upon its surface like the mountains on our globe. This is certainly very much the shape which would be assumed in times of wondering ignorance by the rumours transmitted from a distant land, and perhaps through a long succession of generations, of such an unintelligible marvel as the drawing down of the heavens towards the earth by the optician's glass. The doctrine, however, that the moon was a globular body like the earth, and that its surface was similarly varied by elevations in one place and depressions in another, may naturally enough have been adopted by these ancient astronomical sages, merely on general considerations of theory or probability, and without having been suggested by any spots or excrescences actually detected on the planet by the eye.



Astronomical Instrument.

An account of a curious relic found in Ireland, which is supposed to be an ancient Celtic astronomical instrument, has lately been communicated by Sir William Betham to the Royal Irish Academy. Parts of similar instruments have before been found in that country, but the present is the only perfect specimen that is known to exist. It is of what is called Celtic brass, that is, bronze,

* See upon this subject Moore's History of Ireland, pp. 33, and 68—71; and O'Brien's Round Towers, pp. 48—62. This last writer, however, while he admits the astronomical purposes of the towers, assigns their erection to another order of priests, of the Budhist faith, who, he contends, preceded the Druids, and far surpassed them in the knowledge of astronomy and in all other learning.

and "consists," to quote the description of Sir William Betham, "of a circle, the outside edge of which represents the moon's orbit, having on it eight rings representing the different phases of the planet. In the inside of this circle is another fixed on an axis, in the line of the inclination of the poles, on which this, which represents the earth, traverses." The size of the instrument is not given, but it is conceived to have been in common use, probably in teaching the science of astronomy, and, in its exhibition, to have been suspended from the ring representing the moon in its first quarter by another ring, which was found loose in that.

Several circles of ancient stones, it may be added, exist both in Wales and in Ireland, which still bear, in the language of the people, the name of the Astronomers' Circles, and are supposed to mark the sites of Druidical observatories, or seminaries for instruction in astronomical science. But this study could not have been prosecuted to any extent without a considerable proficiency in the abstract sciences both of mathematics and numbers; and these branches also, therefore, we must suppose to have formed a part of the Druidical learning, and of that extensive course of instruction which we are told the pupils of the Druids sometimes spent twenty years in passing through.

On the whole, shrouded from our distinct view as the facts of the subject are by the remoteness of the time, and the scantiness of the light shed upon them by history, there is reason to believe that these studious Celtic priests had accumulated no contemptible stock of knowledge in various departments of science and philosophy. According to Ammianus Marcellinus, it was to the Druids that the Gauls were indebted for nearly all that they possessed of civilization and learning; and the same thing in all probability might have been said of the Britons. That with the real and valuable knowledge possessed by the Druids, there was much error and superstition mixed up, there can be no doubt; everything they believed, and everything they taught may have been, at the best, but a mixture of truth and falsehood; but still it would be very far from being worthless on that account. In the most advanced state to which human knowledge has yet attained, it has perhaps in no department been purified from all alloy of error; and in the greater number of the fields of philosophical speculation, the conjectural and doubtful still forms a large portion of the most successful investigations that the wit of man has been able to achieve. Civilization could never make any progress, if nothing except knowledge free from all error could carry it forward. Nor shall we perhaps be disposed, upon reflection, to pass a very severe judgment upon the Druids, even if they should appear to us, in their endeavours to secure an influence over the popular mind, not to have scrupled sometimes to employ such arts of deception as their superior knowledge enabled them to play off. It is not necessary to assume that in practising these pious frauds, they set no other object before them except the maintenance of their own ascendancy; that object may not have been overlooked, but in pursuing it they may have believed at the same time that they were adopting the best course for the people over whom they exercised so powerful a sway. Whatever we may think of the soundness of their reasoning, this may have been their motive; such a consideration may be supposed to have actuated them, even if we admit, as is very likely, that their judgment in the case was somewhat biassed by their self-interest. Undoubtedly neither fraud nor force seems to be a suitable instrument of civilization; but it is also not to be doubted that both have often been so employed, not only with the most honest intentions, but what is more, not without some degree of success. They may not be the best civilizers in ordinary circumstances, or their use may not be justifiable on principle in any circumstances; but it does not follow that they have never been used either with any good effect or with any good design. Perhaps what was good in the effect has always been counterbalanced by what was bad in its accompaniments;—it has doubtless always been impaired in that way;—but still in many instances the attempt cannot reasonably be charged as being, at the very worst, anything worse than a mistake of the judgment. The Druidical religion was a system of delusion and imposture, unquestionably; we mean, it was not only a false religion, but it was one which its priests systematically sought to support by deluding the understandings of the people, and by a thousand devices and contrivances which they must have known to be fraudulent and dishonest. All this it was, in common with nearly every other form of ancient superstition. Nevertheless, we shall certainly not judge either charitably or wisely if we at once assume that in all these old idolatries, some of which have held in awe half the nations of the earth for thousands of years, the priests were nothing else but an uninterrupted succession of knaves and hypocrites, cherishing no thought and pursuing no end but that of the aggrandizement of their own order and the corruption and degradation of their fellow-men. They were, it cannot be doubted, most generally deceived as well as the rest; even while deceiving, and consciously deceiving, others, they remained, to a great extent, deceived themselves; they believed that it was the truth which they supported even by their stratagems and tricks. And the more philosophical minds among them, with whom the religion in no part of it had any credit as a supernatural revelation, may still have deemed its influences on the multitude salutary on the whole, and so have justified to themselves their profession and support of it. The national religion was in almost all these cases the principal cement of the national civilization, and the latter would have crumbled to pieces if the former had been suddenly destroyed or removed.

When the South of Britain became a part of the Roman empire, the inhabitants, at least of the

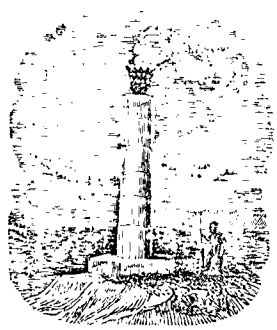
towns, both adopted generally the Latin language, and applied themselves to the study of the Latin literature and art. The diffusion among them of this new taste was one of the first means employed by their politic conquerors, as soon as they had fairly established themselves in the island, to rivet their dominion; and a more efficacious they could not have devised. Happily, it was also the best fitted to turn their subjugation into a blessing to the conquered people. Agricola, having spent the first year of his administration in establishing in the province that order and tranquillity which is the first necessity of the social condition, and the indispensable basis of all civilization, did not allow another winter to pass without beginning the work of thus training up the national mind to a Roman character. Tacitus informs us that he took measures for having the sons of the chiefs educated in the liberal arts, exciting them at the same time by professing to prefer the natural genius of the Britons to the studied acquirements of the Gauls; the effect of which was, that those who lately had disdained to use the Roman tongue now became ambitious of excelling in eloquence. In later times, schools were no doubt established and maintained in all the principal towns of Roman Britain, as they were throughout the empire in general. There are still extant many imperial edicts relating to these public seminaries, in which privileges are conferred upon the teachers, and regulations laid down as to the manner in which they were to be appointed, the salaries they were to receive, and the branches of learning they were to teach. But no account of the British schools in particular has been preserved. It would appear, however, that, for some time at least, the older schools of Gaul were resorted to by the Britons who pursued the study of the law: Juvenal, who lived in the end of the first and the beginning of the second century, speaks, in one of his Satires, of eloquent Gaul instructing the pleaders of Britain. But even already forensic acquirements must have become very general in the latter country and the surrounding regions, if we may place any reliance on the assertion which he makes in the next line, that in Thule itself people now talked of hiring rhetoricians to manage their causes. Thule, whatever may have been the particular island or country to which that name was given, was the most northern land known to the ancients.

It is somewhat remarkable that while a good many names of natives of Gaul are recorded in connexion with the last age of Roman literature, scarcely a British name of that period of any literary reputation has been preserved, if we except a few which figure in the history of the Christian Church. The poet Ausonius, who flourished in the fourth century, makes frequent mention of a contemporary British writer whom he calls Sylvius Bonus, and whose native name is supposed to have been Coil the Good, but of his works, or even of their titles or subjects, we know nothing. Ausonius, who seems to have entertained strong prejudices against the Britons, speaks of Sylvius with the same animosity as of the rest of his countrymen. Among the early British churchmen the celebrated heresiarch Pelagius, his disciple Celestius, St. Ninian the converter of the southern Picts, and St. Patrick the great apostle of Ireland, might all be included in this period; but the missionary exertions of the two last-mentioned will fall to be noticed more conveniently in our next chapter on the History of Religion. Pelagius, although he has been claimed as a native of South Britain, was more probably, like his disciple Celestius, a Scot; that is to say, a native of Ireland. He is said to have been a monk of Bangor; but whether this was the monastery of Bangor in Wales, or that of Bangor, or Banchor, near Carrickfergus in Ireland, has been disputed. Pelagius supported his peculiar opinions with his pen as well as orally; and some controversial writings attributed to him still exist. Until he began to propagate the heretical opinions which have made him so famous, he appears to have enjoyed the highest esteem of his contemporaries for his moral qualities as well as for talent and eloquence; the extraordinary success with which he diffused his views may suffice to attest his intellectual ability and accomplishments. The reputation of his disciple Celestius was nearly as great as his own. Many of the followers of the Pelagian heresy indeed styled themselves Celestians. Celestius also appears to have been an Irishman. St. Jerome, the great opponent of him and his master, almost says as much when, in one of his passionate invectives, he calls him a blockhead swollen with Scotch pottage, that is, what we should now call Irish flummery.* We may quote as a specimen of the eloquence of the age, and also of its most orthodox Christianity, a little more of the "splendid bile" of the learned saint. He goes on to describe Celestius as "a great, corpulent, barking dog, fitter to kick with his heels than to bite with his teeth; a Cerberus, who, with his master Pluto (so Pelagius is designated), deserved to be knocked on the head, and so put to eternal silence." There still exist some epistles and other works attributed to Celestius, which are believed to be genuine.

* The original Latin is "Scotorum pultibus prægravatus."—Vossius, however, in his Dissertation upon Pelagianism, considers the Irish flummery with which Celestius is here said to have been swollen, as meaning the notions of his master Pelagius, and adduces the words as a testimony in favour of the Irish origin of the latter.

CHAPTER VI.

THE HISTORY OF MANNERS AND CUSTOMS.



N the present period, under this head, although it would not be difficult to collect a great deal of matter, by availing ourselves of all that has been related of communities conceived to be in the same state of social advancement with the ancient Britons, and thence assuming, by analogy or conjecture, the particulars of the domestic life and habits of the latter, the real information we possess amounts to very little All that we know upon the subject is to be found in the incidental notices that have fallen from the Roman writers in the course of their historical narratives, or to be deduced from the few relics of the British people that have survived the destruction of time; and even when these sources are most carefully studied, what we learn from both of them together is extremely scanty and unsatisfactory.

We have already described the houses of the Britons. Of the manner in which these rude hovels were furnished we know scarcely anything. In some of the coins of Cunobeline we find the interior of a habitation furnished with seats resembling our modern chairs, stools like the crickets of our peasantry, and others composed of a round block of wood, while the arms of the family are ranged along the wall.* The floor probably served for a bed, and the mantle of the sleeper for a blanket; in winter they might have recourse to the additional warmth of shaggy skins. Wooden bowls and platters, and their celebrated baskets of osier work, would contain their provisions and other necessaries; and in addition to these they had, as already mentioned, articles of coarse pottery, consisting of bowls, cups, and jars. According to Strabo, they also had cups and other vessels of glass; but, as these were articles of importation, it is probable that they were confined to the houses of the chiefs. Though the Britons were a hardy race, yet their climate would make the comforts of a fire desirable during the winter, and accordingly we may suppose that they adopted the obvious resource of a fire upon the floor, until the Romans introduced among them the luxury of a brazier. Their forests supplied them abundantly with fuel; but, in addition to this, they appear to have been acquainted with coal before the arrival of their conquerors, collections of this mineral having been found in various places, attesting their British deposition.* The only coal they had, of course, was gathered upon or near the surface, and used in cases where wood could not easily be obtained. Their diet, no doubt, corresponded with the poverty of their dwellings and the general simplicity of their lives. The country, where it was cultivated by that superior race who occupied the sea-coast opposite Gaul, was productive in grain, and the pastures were covered with flocks and herds, so that the fortunate natives of these quarters were well supplied with the materials at least of even comfortable living. Of the milk they made curds; and while the Romans, contented with their own olives, were ignorant of butter, it was probably known to the Britons, as Pliny informs us it was generally to the barbarous nations.† Salt was an imported article at the period of the Roman invasion, and probably was a luxury attainable only by a few.

While such were the articles of subsistence among the more favoured and better civilized of the ancient Britons, their more barbarous countrymen must have been in a state of considerable destitution. This is evident from the testimony of several Roman authors. Cæsar, who attests the fertility of Kent and the superiority of its people, informs us also that, in the interior of the island, the inhabitants sowed no grain, but lived on the milk and flesh of their flocks and herds. The inhabitants of the northern parts of the island were in a still more wretched condition in the article of food. We are told of the Mæatæ and Caledonians, that they lived upon the milk of their flocks, upon wild fruits, and whatever they could procure in hunting.‡ This was their food even under favourable circumstances; for it is added that, when they were in the woods, they fed upon roots and leaves. A melancholy proof of their wretchedness may be deduced from what we are told of the substitute they employed in the want of natural sustenance. It was a certain composition, by which, it is said, when they had eaten about the quantity of a bean, their spirits were so admirably supported that they no longer felt hunger or thirst.§ This invention, to which such miraculous effects are attributed, was probably nothing more than a drug made use of by them

* Pegge on the Coins of Cunobelinus.

* Whittaker's Manchester, sec. iii. chap. 9.
† Nat. Hist. xi. 96. ‡ Xiphilin. in Sever. § Idem.

to deaden the gnawings of hunger, just as Indian hunters, in similar cases, gird a bandage tightly upon their stomachs. The game upon which the more needy or more adventurous natives, both of the north and south, chiefly subsisted, was probably of a kind only to be procured with difficulty,—the bison, the boar, and the moose-deer, against which their imperfect weapons must have been frequently unavailing. Antiquarians have been more curious about how this game was cooked than were probably the hunters themselves; and while some have alleged that the ancient Britons ate it raw in the forests, after expressing the blood between flat stones or pieces of timber, according to the fashion of the Scotch highlanders in former times, others have supposed that the carcase was baked in a pit lined with heated flints, as is done in the present day by the New Zealanders.

We have already mentioned the abstinence of the Southern Britons from hares and poultry, and that of those in the north from fish. It is remarkable that in this last particular the ancient occupants of the northern part of our island were till lately imitated by their representatives, the Scottish Highlanders. But whatever may have been the cause of this avoidance of what we should deem some of the most natural and salutary kinds of food, the early Britons have been accused of not abstaining from the most revolting of all the gratifications of a depraved appetite. Antiquity has subjected them to the odious charge of cannibalism. Diodorus Siculus and Strabo both mention the existence of a report to that effect respecting the Irish; St. Chrysostom, in one of his sermons, speaks of it as a practice that had prevailed, in the exclamation—"How often was human flesh eaten in Britain?" and St. Jerome seems expressly to affirm that when he was a young man, in Gaul, he saw some of the Attacotti, a British nation, eating human flesh. Gibbon has adduced this as the testimony of an eyewitness to the fact of the cannibalism of some of the Britons, and has declared that he finds no reason to question the veracity of the saint; but the account is certainly in some respects a strange one. It is difficult to believe, in the first place, that an exhibition of cannibalism could be publicly tolerated in the fourth century in the Roman province of Gaul. But Jerome not only would seem to say that he saw the Attacotti eating human flesh; he adds, as equally what he had ascertained by his own observation in Gaul, that these British savages, when they found herds of hogs and cattle in the woods, were wont to cut off and devour certain parts of the bodies of the shepherds, which they accounted particularly delicate. Now this certainly he could not have seen with his own eyes, although he may have heard it reported. Although, therefore, his words are not so cautious as they ought to have been, and are dictated with a view to rhetorical effect, we seem to be justified in regarding him as testifying not to what he had seen, but only to what he had heard, in the whole story. Still his statement will be evidence to the reptuation of the Attacotti for man-eating; and all we can say is, that it is not impossible they may have deserved the character they appear to have acquired. The frequent existence of the practice of cannibalism among tribes not always in the lowest stage of barbarism, has now been completely established. The Battas of Sumatra, who have a written language, and have in other respects made considerable advances in civilization, have perhaps carried the practice further than it has been carried in any other country.

We know nothing about the habits of the Britons in regard to temperance in drinking. Mead, or metheglin, was probably the common beverage at their social feasts, as it is said to have been among the Celtic nations generally. They are also said to have used a preparation from barley,* forming a coarse sort of wine, or "spurious Bacchus," as the Italians called it, which was of a much more intoxicating quality. This was nothing more than a species of ale common to the Gauls, the Spaniards, and the nations of the west and north, and alluded to by several writers,† who admired the ingenuity of savages in making even water intoxicate. With wine they probably had little if any acquaintance.

In their personal appearance, the Britons seem to have been a people of large limbs and much muscular strength and activity. This much may be gathered even from the narrative of their various encounters in fight with the Roman legions. Strabo mentions that he had seen some British young men at Rome half a foot taller than even the Gauls, who were a bulky race compared with the Italians. He alleges, however, that they were not strongly and gracefully formed in proportion to their great stature, and did not stand very firmly upon their legs; but this was perhaps owing to the immaturity of those juvenile specimens that came under his notice.

Their clothing, both for warmth and ornament, is one of the chief signs by which the degree of civilization among an early people is indicated. The half-naked savage shivering amidst the storm of the elements, with no better defence than a loose cloak of skin, betokens a human being in the lowest stage of helplessness, and whose intellectual capacities are as yet in great part dormant. The addition of a single pin or button, by which his garment is rendered more comfortable, indicates an advance in intellect that will operate equally upon all his other arrangements; and as one piece after another, for convenience or decoration, is added to his attire, we may commonly trace the progress of his general civilization. Mere expediency was at first his standard; but as his wants increase and his tastes improve, the narrow limits of necessity are soon overstepped for those of decency, gracefulness, and splendour.

The Mæatæ and Caledonians are described by the Romans as living in a state of nudity; but as they seldom saw these warlike tribes except in

* Dioscorid. lib. ii. c. 110. † Pliny, Orosius, Isidorus.

battle or flight, their want of clothing may have been only temporary, and for convenience, during their desultory warfare. The flinging off of their garments in battle was a custom general among the Celtic nations. Livy informs us that, at the battle of Cannæ, there were Gauls who fought naked from the waist upwards; and Polybius says that some Belgic Gauls fought entirely naked, but it was only on the day of battle that they stripped themselves. It was thus that, in the battles of modern times, the Scottish Highlanders were accustomed to throw off their plaids, by which they sometimes astonished their antagonists by the view of their naked limbs, as much as their prototypes did the Roman legions, and incurred an equal charge of barbarism. Cæsar himself infmors us that the inhabitants of the interior of Britain wore clothing of skins. When this was the case with the least refined part of the population, it is obvious that the more advanced portion of them, who inhabited the sea-coast, must have possessed a more plentiful and less primitive wardrobe. Of the several kinds of cloth manufactured in Gaul, one, according to Pliny and Diodorus Siculus, was composed of fine wool dyed of several colours, which being spun into yarn, was woven either in stripes or chequers; and of this the Gauls and Britons made their summer garments. Diodorus, describing the Belgic Gauls, says, they wore dyed tunics, beflowered with all

FIGURES OF ANCIENT GAULS IN THE BRACCÆ, TUNIC, AND SAGUM—Drawn from Roman Statues in the Louvre.

manner of colours. With these they wore close trowsers, which they called *braccæ*. These trowsers, an article of dress by which all the Barbaric nations seem to have been distinguished from the Romans, were made by the Gauls and Britons of their striped or chequered cloth, called *breach*, *brycan*, or *breacan*, *breac* in Celtic signifying anything speckled, spotted, striped, or in any way party-coloured. Over the tunic both the Gauls and the Britons wore a short cloak, called a sagum by the Romans, from the Celtic word *saic*, which, according to Varro, signified a skin or hide, such having been the material which the invention of cloth had superseded. The British sagum was of one uniform colour, generally either blue or black.* The predominating tint in the chequered trowsers and tunic was red. Their hair was turned back upon the crown of the head, and fell down in long and bushy curls behind. Men of rank amongst the Gauls and Britons, according to Cæsar and Diodorus, shaved the chin, but wore immense tangled mustaches. The ornaments of the Britons consisted, like those of the Gauls, of rings, bracelets, and armlets of iron, copper or brass, silver or gold, according to the rank or means of the wearer, and that peculiar decoration the *torch* or *dorch*, Latinized *torques*, which was probably a symbol of nobility or command. When the captive Caractacus was led through the streets of Rome, several of these chains,—the spoils which he had taken from his conquered enemies in Britain,—were carried in the procession.† It was a sort of necklace or collar composed of flexible bars of gold or silver, twisted or moulded like a rope or wreath, and hooked together behind. Sometimes the torques were formed of bronze; and Herodian says that those of the northern part of the island wore torques of iron, "of which they were as vain as other barbarians were of gold."‡ Specimens of those of gold, silver, and bronze have been frequently found both in Britain and Ireland. Two splendid specimens of gold torques found in the county of Meath have been supposed, from their size, to be meant for girdles instead of collars, as Herodian mentions they were also worn round the waist. From the hook of one proceeded a gold wire, a quarter of an inch thick and eight inches long, terminating in a solid knob, an appendage never before seen in any specimen. The weight of the whole torque was twenty-five ounces.* The ring, Pliny tells us, was worn by the Britons and Gauls upon the middle finger.

Of the weapons, offensive and defensive, of the ancient Britons several specimens have been preserved. The most complete collection is undoubtedly that at Goodrich Court. Hatchets or battle-axes of stone, arrow-heads of flint and lances of bone, supposed to have been the primitive weapons, and others of the same form but of mixed copper and tin; the leaf-shaped sword of the same metal, worn also by the Gauls, and the metal coatings of the flat circular shields or targets, called tarians or clashers, the concentric circles on which, separated by rows of little knobs, forcibly remind us of the Highland target, are all to be seen there in perfect preservation. The shields have a hollow boss in the centre, to admit the hand, as they were held at arm's length in action.†

A most interesting relic of this period was lately discovered in a carn at Mold, in Flintshire. It is a golden breastplate or gorget, embossed with a figured pattern in various degrees of relief. It was found containing the bones of the deceased warrior, and in the position in which it would have been worn, with remnants of coarse cloth or serge, beads of amber, and pieces of copper, upon which the gold had been probably fastened. Its extreme length is three feet seven inches, being made, apparently, to pass under the arms and meet in the centre of the back; and its width in front, where it is hollowed out to receive the neck, eight inches. Some separate pieces found with it appear to have passed over the shoulders like straps, but the mutilation of the corslet at the very point on each

side at which they must have been affixed unfortunately prevents us from ascertaining precisely the mode of their application. The breastplate is here engraved from the original, which is now in the British Museum.*

We have already more than once had occasion to advert to the painted skins of the Britons. Cæsar, the first of the Roman writers who mentions this national peculiarity, describes it to have consisted merely in staining themselves of a cerulean colour with the herb vitrum or woad. Solinus, however, represents the process as a laborious and painful one, but permanent in its effect, and speaks of the painting as consisting chiefly of the figures of animals that grew with the growth of the body. Herodian says they punctured their bodies with the figures of all sorts of animals. Isidore is still more explicit, for, in speaking of the Picts whose name he derives from their coloured skins, he tells us that the painting was done by squeezing out the juice of certain herbs upon the body, and puncturing the figures with a needle. Here, then, we have the same process of *tattooing* which is performed in the present day by the natives of the South Sea islands. Cæsar supposes the Britons to have coloured their skins for the purpose of terrifying their enemies; but such could scarcely have been the object with a people among whom the practice was universal, and whose wars were international. Probably this skin-painting was the national dress, and existed in its highest state of perfection at a period considerably prior to the Roman invasion, when the clothing of the people was more scanty than in the days of Cæsar. They might attempt by the operation, also, to indurate the skin more effectually against the inclemency of the elements. But a still stronger motive for the endurance of such pain and labour as the practice occasioned, is to be sought in that love of ornament so natural to mankind at large, and so especially powerful in the savage. The ancient Briton, in the absence of other distinctions in the way of clothing and decoration, would find, in these fantastic ornaments, his badge of rank in society, and his chief attraction in the eyes of the other sex. As the process also was performed in early youth, it was a probation, among a rude people, for a life of hardihood; and by the profusion of its lines and figures, the wearer evinced his contempt of pain and power of endurance. But when the body began to be covered, such a profusion was found superfluous; and as the articles of raiment were increased, the blue figures were proportionably discontinued, so that the practice gradually declined, and was at last wholly abandoned. It is therefore that we hear no more of this tattooing in the South after it was subdued and civilized into a Roman province; though it still continued among the rude tribes of the North, where it lingered until it was banished thence also by the full attire of civilization.* We may here observe that, by the same gradual process this practice is on the wane in New Zealand, and probably, in the course of a century, will be recorded among the things that have been.

A still more singular distinction than that of a painted or punctured skin separated the ancient Britons morally from the rest of the world, as much as their insular position did geographically. This was the nature of their institutions or customs of marriage. Those rights of exclusive property in a wife, which even among the rudest tribes are prized so highly, and guarded with such jealous care, are asserted to have been strangely disregarded by the early inhabitants of this island. According to Cæsar, ten or twelve families used to live under the same roof, the husbands having their wives in common. The ties of previous consanguinity, also, so far from being a check, seem rather to have been considered as a recommendation in these strange associations, in which, we are told, for the most part brothers joined with brothers, and parents with their sons. The paternity of the children was settled by their affiliation upon the person by whom their mothers had been first married. Of the manner in which the children were reared, all the information we have is a story told by Solinus, who relates that the first morsel of food was put into the infant's mouth on the point of his father's sword, with the prayer that he might prove a brave warrior and die on the field of battle.

These matrimonial clubs have appeared so preposterous and incredible to inquirers of the present day, that many have been disposed to class them among the fictions of antiquity. It has been supposed that the Romans drew a wrong conclusion from the British mode of living, which was so unlike their own, and, finding so many families huddled together under one roof, too hastily assumed that they lived in all respects in common. But the Romans were never so mistaken when they found other rude tribes thus crowded together: while they brought this revolting charge against the Britons, they have imputed nothing of the kind to the Germans, for instance, who were placed in similar circumstances. The fact, too, does not depend upon the solitary testimony of Cæsar. It is also stated by Dio Cassius, or his abridger Xiphilinus; and that writer reports a conversation respecting it between the Empress Julia and the wife of a British chief, in which the latter, on being rallied about the marriages of her countrywomen, at once admits the charge, only retorting that the Roman matrons acted in a manner much more indefensible by indulging themselves in an equal licence covertly, and in violation of the laws of their country. St. Jerome also speaks of the practice as still prevailing in his day, in the northern parts of Britain. It lingered in these regions, of course, long after civilization and Christianity had extirpated it in the

* See also engraving and account by Mr. Gage in vol. xxvi. of the Archæologia, p. 22.

* We shall find in the sequel, however, that it re-appeared among the Saxons.

south. But even during the general prevalence of this promiscuous polygamy, the virtue of conjugal fidelity, as already noticed, seems still to have been perfectly well understood, and also held in much respect. Their marriages, however extraordinary their nature appears to us, may still have been protected by a law, the provisions of which it was both dangerous and disreputable to transgress. Cartismandua, the Queen of the Brigantes, when she transferred her affections from her husband to her armour-bearer, may very probably have violated the established regulations, however liberal; and hence the universal storm of indignation which her conduct raised. Or, the community of husbands and lovers may have been customary only among the lower classes, and not tolerated by the general opinion in the case of the princes and chiefs. Female honour also appears, from the instance of Boadicea, and from various scattered notices in the Roman writers, to have been highly appreciated by the Britons. The general respect in which women were held, indeed, is attested by various circumstances. They, as well as men, appear to have assumed the prophetic office, and dictated for the emergencies of the future. Women occasionally both held the sovereignty of states, and commanded armies in the field of battle. This is the reason that some of the female sepulchres, when opened, display an assortment like the commodities of Ulysses, when he went to discover Achilles, viz., implements of housewifery, trinkets, and war-like weapons.

Those affections that have cherished a friend or relative when living, are generally expressed for his lifeless remains in a great variety of forms; and as love and friendship are most intense among the uncivilized, the rudest tribes are found to present the most striking indications of these passions, in their funeral ceremonies and modes of burial. The intensity of their feelings on such occasions the ancient Britons have sufficiently announced to posterity, in the numerous barrows that exist in the southern division of the island, and the cairns that are found in the northern. What particular ceremonies they used in their interment of the dead we know not; but, from the contents of the graves, we find that, like other rude nations, they buried with the body whatever they accounted most valuable. Weapons of war and of the chace, ornaments of every kind, and even articles of jewellery were thus deposited; and frequently also the relics of dogs and deer are found mixed with human bones. All

this had, doubtless, a prospective view to the existence of the departed individual in a future state; he was thus not only arrayed for that other scene in a manner befitting his rank and former estimation, but furnished with the means of defence, subsistence, and amusement. The prodigious labour with which the old British barrows were evidently constructed, by soil in many cases brought from a great distance, and the care and ingenuity displayed in their forms, excite the wonder of modern ages. These strange sepulchres exhibit great variety both in size and shape, and by this, in some cases, we can conjecture not only the period of their construction, but also the condition of those whom they were designed to commemorate. Thus the immense mounds of earth of an oblong form and rude construction, some of which are about 400 feet in length, but containing few bones, and fewer valuable relics, were probably the earliest graves of the island, and designed for chieftains, who could more easily obtain the labour of a thousand vassals, than the possession of a single trinket. Next to these may perhaps be classed the bowl-shaped barrows, as they are called, which are plain hemispheric mounds of earth. The bell-shaped barrow is evidently of still later date, being an improvement upon the former, having its sides gracefully curved inward, immediately above the surface, and exhibiting greater skill and labour in its construction. To these may be added what have been improperly termed the Druid-barrows: these are the most elegant of the whole series of graves, and appear to have been in general occupied by females, from containing trinkets of a finer and more feminine character, and bones of a smaller size than those of the others. It would appear also that these vast piles were reserved only for chiefs and personages of elevated rank; while the common people, as in other countries, were buried in those more humble receptacles whose traces are soon erased.

In the interment of the dead, the Britons appear to have observed a variety of modes in the disposition of the body. In all probability the earliest

was, to place it in a cist, with the legs bent up towards the head. This practice is generally found to have been adopted in the long barrows mentioned above; and in these, along with the remains of the body, there are sometimes found daggers of bronze, and drinking cups of the rudest workmanship. Sometimes they laid the body in the grave at full length. In these cases, the articles of bronze and iron, such as spear-heads, lances, swords, bosses of shields, and ornaments of chain-work, together with beads of glass and amber, and other trinkets, proclaim a more refined period, and greater skill in the arts. In some instances, their practice seems to have assimilated more nearly to that now followed, the bodies being inclosed in a strong wooden coffin, riveted with bronze, or an unbarked piece of a tree, hollowed out in the centre. It appears, however, that they were also in the frequent practice of consuming the body by fire. In many of the barrows, the charred, or half-burnt bones are found carefully collected on the floor, or deposited within a cist cut in the chalk. A still more classical mode of burial was also frequently followed among the Britons. When the body had been consumed on the pile, the ashes were carefully collected, inclosed in a linen sheet, which was secured by a brass pin, and deposited in an urn. Many of the barrows, on being opened, are found to contain these urns, which are placed, in most instances, with the bottom uppermost. This practice of sepulture by burning, appears to have been wholly confined to the inhabitants of the southern part of Britain, making it probable that they had learnt it from the Romans. As for the Caledonians, it would seem that they were contented with laying the body in the earth entire, and raising over the spot a loose heap of stones, to perpetuate the memory of the departed.*

Such are nearly all the facts that are now to be collected under the head of the private life and social habits of the Britons, while they remained an unconquered people. The transformation of the island, or the greater part of it, into a Roman province, also in course of time transformed the inhabitants into Romans, in their tastes, manners, and modes of life. The country now, in every respect, assumed a new aspect. The forests were opened, and roads constructed in every direction; and the wild beasts being dislodged, the occupation of the hunter ceased, or became an occasional amusement. The building of towns, and the extension of traffic, banished those rude practices or inconvenient customs, that were only tolerable amidst the dreariness of the woods and the idleness of their inhabitants. Superior modes of agriculture were introduced; and the natives, thus taught the fertility of their soil, forsook a precarious mode of subsistence for the settled life of the husbandman. Houses of brick or stone gradually superseded those of mud or timber; and while, in the progress of improvement, the tesselated pavement and domestic ornaments of the "eternal city" adorned the habitations of the British kings and chieftains, their retainers would also, in their humbler sphere, vie with each other in the comforts of their dwellings. In this manner, too, the sports and recrea-

tions of the people would be either changed or modified. The chariot being laid aside, as unserviceable in the Roman mode of fighting, that enthusiasm for horsemanship which it cultivated must necessarily have decayed. Now that the several native tribes were no longer permitted to war against each other, the warlike exercises in which their youth and manhood were formerly trained became unnecessary, and perhaps were prohibited by the law. Their religious practices, and superstitions of common life, must, in like manner, have rapidly faded away with the disappearance of the Druids, by whose authority they were enforced, and the advances of Christianity and a higher civilization.

Among other things, the external appearance of the Romanized Britons was altogether different from that of their conquered ancestors. We are informed by Tacitus, that so early as during the command of Agricola in Britain, the sons of the British chieftains began to affect the Roman dress. The Braccæ were abandoned by them, and the Roman tunic, reaching to the knee, with the cloak or mantle, still called the sagum, became the general habit, at least of the superior classes. The change in the female garb was less remarkable, perhaps, as it had originally been similar to that of the Romans. The hair of both sexes was cut and dressed after the Roman fashion.

In their arms and weapons similar alterations appear to have taken place, even before the complete subjugation of the country. The metal coating of a shield, supposed to have been fabricated by the Britons after they had been induced to imitate the Roman fashions, was found some years since in the bed of the river Witham, in Lincoln-

shire, with several broken swords and spear-heads of bronze, and is now in the Meyrick collection. It bears a strong resemblance to the Roman scutum. It appears originally to have been gilt, and is adorned on the umbo, or boss, with the common red carnelian of the country. While its shape is Roman, the ornamental detail partakes strongly of the character of the British patterns; and the learned proprietor remarks, that "it is impossible to contemplate the artistic portions without feeling convinced that there is a mixture of British ornaments with such resemblances to the elegant designs on Roman works as would be produced by a people in a state of less civilization."*

While these changes were gradually taking place, however, in the southern parts of the island, the north, beyond the wall of Hadrian, remained in its original wild and uncultivated state. When the Emperor Severus invaded Caledonia in the beginning of the third century, a contemporary author † describes the Mæatæ and Caledonians in almost the same words as Cæsar had the Britons of the interior more than two centuries before.

CHAPTER VII.

HISTORY OF THE CONDITION OF THE PEOPLE.

HE account of each period will be concluded by a chapter under this title, the object of which will be, to take a general view of the whole social condition of the people, and to endeavour to estimate the amount and character of the national civilization, by collecting into a focus the light that may be thrown upon these subjects, both by the various particulars already noticed, and by certain additional classes of facts not admitting of being conveniently introduced under any of the preceding heads. The additional facts will consist principally of such authentic information as can be obtained relating to the distribution of property, the proportions in which the population appears to have been divided into the different classes composing it, the incomes and rates of living of these several classes, the health and sickness of the community, the prevalent diseases, the ordinary length of life, with the other matters belonging to the department of what has been called Vital Statistics, and the statistics of vice and crime, including both the kinds and extent of crime committed, and the institutions for preserving order, and repressing and punishing violations of the law.

The sources of information of this description, however, are lamentably deficient even in regard to the most recent times; and in the earlier periods of our history no regular record of such facts is to be found, even in the most meagre form. In the remote and obscure period with which we are at present engaged, where we are nearly without anything that can properly be called history of any kind, we have only a few incidental notices to guide us to some vague general conclusions on one or two points of the inquiry.

On the question of the degree of civilization possessed by the Britons at the time of the Roman invasion, although it would be easy enough to draw up a plausible argument in support of any hypothesis that might be proposed, it is extremely difficult to come to any certain or perfectly satisfactory determination. The facts upon which we have to form our judgment are too few and too unconnected to afford us more than the merest glimpses of the subject. And from the insulated and fragmentary way in which they are stated, it is a business of the most conjectural speculation to attempt to reconcile them with one another, and to weave them into a consistent whole. On the one hand, we have a country covered in great part with woods and marshes, without towns, except such forest fastnesses as have been found even among the rudest savages (although those of the Britons may have been more artificially defended from hostile assaults), and in all probability without any roads, except some two or three great tracks, sufficing rather to point the way from one locality to another, than to serve as the means of convenient communication. We have a people, in fight at least, showing themselves naked or half naked—without books or letters,—without any arts, as far as our evidence goes, save the simplest and rudest,—without even other habitations, apparently, than mud-hovels, not reared for permanent occupation, but hastily put together to be crept into for a few months or weeks, and then possibly to be abandoned or set fire to on the approach of an enemy or on any other occasion that might make it convenient for their occupants to shift their quarters. Thus, in the impressive sketch of Tacitus, the day following the fatal battle of the Grampians is described as having displayed to the view of the victors a vast silence all around, the hills a wide expanse of loneliness, houses smoking in the distance, not a human being to be met with anywhere by the parties sent out to scour in all directions. This, indeed, was in the wilder regions of the north; but we can hardly doubt that in the wars between the different tribes which we are told raged incessantly even in the southern parts of the island, the people must have been accustomed in like manner to fly for safety to the woods, when a hostile band, too strong to be resisted, swept the country, and without hesitation to leave their slight and miserable dwellings to be ransacked and trodden under foot. We learn even from the brief narrative of Cæsar's campaign, that the natives made for the woods and hid themselves there after every defeat, and that it was from the woods they came forth whenever they ventured again to attack the invaders. In short, they evidently were in the greater part a people living in the woods, which probably covered most of the country, and in which, as has been just noticed, we are expressly told that the only groups of cottages they had that could be called towns or villages, were all hidden. These are the habits of mere savages, in as far as

the climate of a high latitude will allow. On the other hand, we find co-existent with all this rudeness, many indications of a much more advanced social state. These Britons appear to have long maintained a commercial intercourse, not only with the adjacent coast of Gaul, but with other and much more distant parts of the world, from which traders regularly resorted to more than one point of the island. The inhabitants of the south coast, we are expressly told, were not clothed in skins; from which we may infer that they had garments made of woollen cloth, or some other woven or manufactured material. Indeed, the common statement of Cæsar and other writers, that they did not differ much in their way of life from the Gauls, never could have been made of a people who went naked. The Britons of the south were not even dependent for their subsistence solely either upon the chace or upon pasturage; they sowed corn, as well as possessed great plenty of cattle. They were a large population, and their houses also were very numerous. They had a sort of money, perhaps not ruder than that which appears to have been in use in Egypt in the time of the Pharaohs. They showed not only much bravery, but also very considerable skill in war—venturing to encounter even the Roman legions both in sudden surprises and in pitched battles, and evincing military organization and array in the latter, as well as stratagem in the former. Although their offensive arms were not of the best material, they were still of metal, and not merely of wood, or bone, or stone. Their war-chariots, both in their management and their construction, were machines which never could have been found among a people altogether without civilization. Yet we find them in the possession of Galgacus and his Caledonians, as well as of the Britons of the south. Without taking into account the scythes with which they are said to have been armed, the fact that they were carriages running rapidly upon wheels, and capable of being driven impetuously to and fro according to the sudden exigencies of battle, is enough to prove the existence of considerable mechanical knowledge and ingenuity among a people provided with such engines of war. Then there seems to have been established in each tribe a regular government, presided over by a single chief or king, whose power, however, was not absolute, but was controlled by an aristocracy, and perhaps also, in some degree, by the community at large. Dio Cassius, in an account of the northern tribes, tells us that the people had a great share in the government—a circumstance, by the by, which somewhat tends to corroborate the supposition of the Germanic origin of these tribes. Further, the British states, though often at enmity among themselves, had made a sufficient advance in policy, to be accustomed to provide against a common danger, by both leaguing themselves together, and placing the general direction of affairs for the time in the hands of a single chief, selected for his supposed fitness to hold the supreme command. It was thus that they combined under Cassivellaunus, to repel the first invasion of the Romans, and long afterwards under Boadicea to destroy their conquerors after the latter had gained possession of the country; and although they were defeated in both these attempts, and the animosities and conflicting interests or views of the different tribes seem also in both instances to have interfered to hinder the league from being either so extensive or so compact as it otherwise might have been, yet such general movements, however unsuccessfully conducted, could only have sprung from a spirit of patriotism or nationality much too comprehensive as well as too considerate for mere barbarians. Above all, there existed among these Britons a numerous order of persons, constituting what we should now call one of the estates of the realm, who were possessed of a knowledge of letters, and also, we have every reason to believe, of a very considerable amount of scientific knowledge. They had a system of laws regularly taught and administered by these learned sages, and a religion of mysterious doctrines and an imposing ritual of which they were the ministers. These Druids of Britain and Gaul, as we may gather from the instance of Divitiacus, mentioned by Cicero, were qualified by their intellectual acquirements to associate with the most eminent among the literary men of Rome; and in some departments of natural knowledge they were probably more accomplished than any Roman or Grecian philosopher. Even if we suppose the Druidical learning to have been originally an importation from abroad, and never to have spread beyond the members of the Druidical body, it is difficult to conceive that the mass of the population, in the midst of which such a permanent light was fed and sustained, could have been wholly without a civilization of their own, although it may have differed in many of its features from the civilization of the Greeks and Romans, and from that which the modern nations of Europe have in great part inherited from them.

The civilization of the Southern Britons was the same in kind, though perhaps inferior in degree, with that of their neighbours and kindred, the Gauls. It was a social state, implying the possession of many of the more homely accommodations of life, but of very few of its luxuries, or at least of what we should designate by that name. Of luxuries, indeed, in the strictest sense, that is to say, of something more than the indispensable necessaries of existence, no human condition is wholly destitute; the savage as well as the civilized man has his enjoyments beyond what nature absolutely requires; but the luxuries of the latter only are artificial refinements. Of that description of luxuries there was no general diffusion under the civilization of the ancient Britons; their chief extra gratifications were still no doubt those of the savage state—war, and the chace, and the pleasures of roving adventure, and festive merriment, and such other indulgences of little more than mere animal passion, which enlist no arts in their service, and

demand no other materials but such as are spontaneously furnished by nature. But even the highest civilization, it is to be remembered, does not throw these things entirely aside; and their existence, therefore, as an accompaniment of the social condition of the Britons, affords in itself no criterion of the general character of that social condition. It evidently, however, as has been observed, stood elevated in many other respects far above the possession of the mere necessaries of existence; and, therefore, it was not a savage state. It was a state, although of low civilization, yet in which the principle of progression was at work, and out of which a higher civilization would probably, in course of time, have evolved itself. That peculiarity is the great characteristic distinction between civilization and barbarism.

In the mean time, however, came suddenly and by force the substitution of the different and no doubt much more advanced civilization of Rome. Order and magnificence, arts and literature, now took the place of the imperfect government, the constant internal wars, the uninstructed intellects, the mud hovels, the towns in the woods, and the generally rude accommodations of the Britons. The country assumed a new face, and looked as if the light of a new and brighter day had been let in upon it. Cultivation was improved and extended; forests were swept away, with the beasts of prey by which they were tenanted; roads were formed; towns arose, exhibiting, for the first time, piles of regular, stately, and decorated architecture, and multitudes of people moving along in "the sweet security of streets." There cannot be a question that, after the period of transition and conflict was over, this change was on the whole a happy one for Britain. The very silence of history, in regard to the province during a long period of the Roman domination, attests the tranquillity which it enjoyed. That domination lasted altogether for nearly four hundred years; and with the exception of the incursions of the northern barbarians in the reigns of Hadrian and Severus, which the energetic proceedings of these emperors speedily put an end to, little or nothing seems to have occurred to disturb the southern part of the island throughout almost the whole of the second and third centuries. At this time it was probably as flourishing and as happy a province as any other in the empire. It was now occupied by a population no longer cut off from the rest of the world, and lagging in the rear of civilization, but in possession of all the literature and science, and of all the useful and elegant arts, that were cultivated in the most refined parts of the earth, and qualified, therefore, to turn the natural advantages of the country to the best account. The panegyric of the orator Eumenius on Constantine the Great may be received as testifying to the general belief of the prosperous and happy condition of Britain, even at a later date. "Oh! fortunate Britannia!" he exclaims, "thee hath nature deservedly enriched with the choicest blessings of heaven and earth. Thou neither feelest the excessive colds of winter nor the scorching heats of summer. Thy harvests reward thy labours with so vast an increase, as to supply thy tables with bread and thy cellars with liquor. Thy woods have no savage beasts; no serpents harbour there to hurt the traveller. Innumerable are thy herds of cattle, and the flocks of sheep, which feed thee plentifully and clothe thee richly. And as to the comforts of life, the days are long, and no night passes without some glimpse of light." Another panegyrist of the same age, in like manner expatiates upon the excellencies of Britain as "a land so stored with corn, so flourishing in pasture, so rich in variety of mines, so profitable in its tributes; on all its coasts so furnished with convenient harbours, and so immense in its extent and circuit." "It is the masterpiece of Nature," affectionately adds our own Camden, after quoting these ancient testimonies, "performed when she was in her best and gayest humour, which she placed as a little world by itself, by the side of the greater, for the admiration of mankind; the most accurate model, which she proposed to herself, by which to beautify the other parts of the universe."

BOOK II.

THE PERIOD FROM THE ARRIVAL OF THE SAXONS TO THE ARRIVAL OF THE NORMANS. A.D. 449—1066.

CHAPTER I.

HISTORY OF CIVIL AND MILITARY TRANSACTIONS.

SOME etymologists have derived the word Saxon from the term *Seax*, a short sword with which the warlike natives of the shores of the Baltic, the Elbe, the Weser, and the Rhine, are supposed, but on somewhat doubtful authority, to have been generally armed. It is much more probable, however, that the Saxons are the Sakai-Suna, or descendants of the Sakai, or Sacæ, a tribe of Scythians, who are mentioned by ancient writers as making their way towards Europe from the East so early as in the age of Cyrus. Pliny tells us of a branch of the Sacæ, who called themselves Sacassani; and Ptolemy designates another branch by the name Saxones, which seems to be merely another form of the same word. But whatever was the etymology of the name, it was certainly, at the time of the British invasion, applied, in a very general sense, to tribes or nations who were separate, and differing in some essentials, though they had most probably all sprung from the same stock at no very distant period, and still preserved the same physical features, the same manners and customs, and nearly, though not quite, the same unaltered language, which, at the distance of fourteen centuries, is the basis and staple of the idiom we speak. They were all of the pure Teutonic or Gothic race, and all their kings claimed their descent from Wodin, or Odin, an ancient sovereign, magnified by veneration and superstition into a god, the traces of whose capital (real or traditional) are still shown to the traveller at Sigtuna, on the borders of the great Mälar Lake, between the old city of Upsala and Stockholm, the present capital of Sweden. Other tribes that issued both before and after the fifth century from that fruitful storehouse of nations, Scandinavia, were of the same Teutonic origin; and the Franks, the Danes, the Norwegians, the Norse, or Northmen, and the most distinguished of the last mentioned, those known throughout Europe under the name of Normans, were all of the same race, and

BORDER TO THE TITLE-PAGE OF CHARLEMAGNE'S BIBLE, WRITTEN BY ALCUIN.—Reduced from the Original in the British Museum.

commenced their career from the same regions, though differing subsequently, owing to the time and circumstances of their disseverance from the great northern stock, the direction in which their migrations and conquests had lain, and the character, physical and moral, the habits, and the language of the people they had conquered, or among whom they had settled and been mixed. It would neither be a profitable nor a very easy task to trace all these kindred streams to their primitive fountain-head, by the shores of the Caspian, in Asia, and thence follow them back again to the coasts, promontories and islands of the Baltic and the Rhine; but it is necessary to give a local habitation to the particular tribes that now began to work a total change in Britain. Although classed under one general head, as Saxons, these tribes were three in number: 1. The Jutes. 2. The Angles. 3. The Saxons. The Jutes and the Angles dwelt in the Cimbric Chersonesus, or peninsula of Jutland (now a province of Denmark), and in parts of Schlesswig and Holstein, the territory of the Angles extending as far as the modern town of Flensburgh. In Holstein there is a district still called Anglen (the real old England); and the narrowness of its limits need not interfere with our belief that this was the seat of the tribe (the Angles) that gave its name to our island. The Saxons Proper, to the south of the Jutes and Angles, were far more widely spread, extending from the Weser to the Delta of the Rhine, and occupying the countries now called Westphalia, Friesland, Holland, and probably a part of Belgium. Their precise limits are not fixed, but, it seems, their gradual encroachments on the continent had brought them from the Baltic to the neighbourhood of the British Channel, when they embraced, as it were, our south-eastern coast. From the very close resemblance the old Frisick dialect bears to the Anglo-Saxon, a recent writer conjectures that the conquerors of Britain must have come principally from Friesland.* But many known fluxes and refluxes of population took place between the fifth and the twelfth centuries: the Jutes and the Angles, whose language may have been as like that of our Anglo-Saxon ancestors as the old Frisick dialect, were partially dispossessed

* Palgrave, Hist. Eng

ARMS AND COSTUME OF THE TRIBES ON THE WESTERN SHORES OF THE BALTIC.
Designed from a Plate in Sir S. Meyrick's "Ancient Costume of the British Islands;" and taken by him from some Danish horns of gold.

of their territory in the peninsula of Jutland, and mixed up with newer tribes from Scandinavia, who eventually formed the Danish kingdom, and must have influenced the dialect there, as afterwards in Schlesswig and Holstein. On the other hand, the occupants of the remarkable district of Friesland, where language, manners, usages—where all things seem, even in our days, to retain an ancient and primitive stamp, may, from local situation or other causes, have escaped the intermixture that befel the other Saxons. It is generally admitted that Horsa, Hengist, and their followers, were Jutes, and that the tribe or nation they first called in to partake in the pay and spoils of the Britons, were their neighbours the Angles, from Holstein, and not the Saxons, from Friesland, though the latter soon joined the enterprise, and probably derived some advantage from being nearer than the others to the scene of action.

When the conquests of the Romans, in the first century of our era, brought them into contact with the Saxons, they found them as brave as the Britons, but, like the latter people, unprovided with steel blades and the proper implements of war. During the three centuries, however, that had elapsed since then, in their wars with the Roman armies, and their friendly intercourse with the Roman colonies in Gaul and on the Rhine, they had been made fully sensible of their wants, and learned, in part, how to supply them. In their long-continued piratical excursions they had looked out for bright arms and well-wrought steel, as the most valuable article of plunder, and a constant accumulation must have left them well provided with that ruder metal which commands gold. When they appeared in Britain, they certainly felt no want of good arms. Every warrior had his dagger, his spear, his battle-axe, and his sword, all of steel. In addition to these weapons, they had bows and arrows, and their champions frequently wielded a ponderous club, bound and spiked with iron, a sort of sledge-hammer, a copy, possibly, from the Scandinavian type of Thor's "mighty hammer." These two weapons, the battle-axe and the hammer, wielded by nervous arms, were the dread of their enemies, and constantly recurring images in the songs of their bards, who represent them as cleaving helmets and brains with blows that nothing could withstand. When their depredations first attracted the notice of the Romans, they ventured from the mouth of the Baltic and the Elbe, in crazy little boats; and shoals of these canoes laid the coasts of Gaul, Britain, and other parts of the empire under contribution. Though larger, the best of these vessels could scarcely have been better than the coracles of the British: they were flat-bottomed, their keels and ribs were of light timber, but the sides and upper works consisted only of wicker, with a covering of strong hides. In the fifth century, however, their chiules,* or war ships, were long, strong, lofty, and capable of containing each a considerable number of men with provisions and other stores. If they had boldly trusted themselves to the stormy waves of the Baltic, the German ocean, the British channel, and the Bay of Biscay, in their frail embarkations, they would laugh at the tempest in such ships as these. All their contemporaries speak of their love of the sea, and of their great familiarity with it and its dangers. "Tempests," says Sidonius, "which inspire fear in other men, fill them with joy: the storm is their protection when they are pressed by an enemy—their veil and cover when they meditate an attack." This love of a maritime life afterwards gained for some of the northmen the title of Sea-kings. The passion was common to all the Saxons and to the whole Teutonic race; and a recent historian has suggested that the settlement of so many pirates in England, the natives of every country from the Rhine to the North Cape, may have contributed to cultivate those nautical propensities which form a part of the English character.*

Thus supposing that the Britons retained the arms of the Roman legions—and there is no reason to doubt that they did, though the Roman discipline was lost—their new enemy was as well armed as themselves; while the Saxons had over them all the advantages of a much greater command of the sea, and could constantly recruit their armies on the continent, in the midst of their warlike brethren, bring them over in their ships, and land them at whatever point they chose.

At the period of their invasion of Britain, the Saxons were as rough and uncouth as any of the barbarian nations that overturned the Roman empire. Of civilization and the arts, they had only borrowed those parts which strengthen the arm in battle by means of steel and proper weapons, and facilitate the work of destruction. They were still Pagans, professing a bloody faith, that made them hate or despise the Christian Britons. Revenge was a religious duty, and havoc and slaughter a delight to their savage tempers. Their enemies and victims who drew their portraits darkened the shades; and the Saxons had, no doubt, some of those rude virtues which are generally attached to such a condition of society.

The obscurity that comes over the history of Britain with the departure of the Romans, continues to rest upon it for the two following centuries. In the first instance, Hengist and Horsa appear to have fulfilled their part of the engagement upon which they had come over by marching with the Jutes, their followers, against the Picts and Scots, and driving these invaders from the kingdom. Soon after this, if it occurred at all, must be placed the story of the feast given by Hengist, at his stronghold of Thong-caster, in Lincolnshire, to the British King Vortigern, and of the bewitchment of the royal guest by the charms of Rowena, the young and beautiful daughter of his entertainer. Rowena's address, as she gracefully knelt and pre-

* Hence our word *keel*.

* Sir James Mackintosh, Hist. Eng.

VORTIGERN AND ROWENA.—Angelica Kauffman.

sented the wine-cup to the king, *Liever Kyning wass heal* (Dear king, your health), is often quoted as the origin of our still existing expressions, wassail and wassail-cup, in which, however, the word wassail might mean health-drinking, or pledging, although it had never been uttered by Rowena. But as the story goes on, the action and the words of the Saxon maid finished the conquest over the heart of the king which her beauty had begun; and, from that time, he rested not till he had obtained the consent of her father to make her his wife. The latest writer who has investigated the history of this period, sees no reason to doubt the story of Rowena, and has advanced many ingenious and plausible arguments in proof of its truth.* But, at any rate, it appears that, either from Vortigern's attachment thus secured, or from his gratitude for martial services rendered to him, or from an inability on his part to prevent it, the Jutes were allowed to fortify the Isle of Thanet, and to invite over fresh forces. The natural fertility and beauty of Britain, as well as its disorganization and weakness, must long have been familiar to the pirates on the continent; and as soon as they got a firm footing in the land, they conceived the notion of possessing at least a part of it, not as dependent allies or vassals, but as masters. The conquest of the whole was probably an after-thought, which did not suggest itself till many generations had passed away. The sword was soon drawn between the Britons and their Saxon guests, who, thereupon, allied themselves with their old friends the Scots and Picts, to oppose whom they had been invited by Vortigern. That unfortunate king is said to have been deposed, and his son Vortimer elected in his stead. A partial and uncertain league was now formed between the Roman faction and the Britons; and several battles were fought by their united forces against the Saxons. In one of these engagements, Vortigern is said to have commanded the Britons. Then, after a time, the two nations, according to the story commonly told, agreed to terminate their contention; and a meeting was held, at which the chief personages of both were mixed together in festive enjoyment, when, suddenly, Hengist, exclaiming to his Saxons, *Nimed eure seaxas* (Unsheath your swords), they pulled forth each a short sword or knife, which he had brought with him concealed in his hose, and slew all the Britons present, Vortigern only excepted. This story, too, has been treated as a fiction by most recent writers; but the same ingenious and accomplished inquirer who has vindicated the historic existence of Rowena, has also argued ably and powerfully in favour of the truth of this other ancient tradition. "The transaction," he observes, "certainly occurred. It has been unjustly brought into doubt. The memory of it is generally diffused among the British: it is detailed in their Bruts; it is referred to in their Triads as a notorious event; and it is alluded to by their bards, in language of dark and mysterious allusion, which proves its reality better than the

* Britannia after the Romans, pp. 42. 62, &c.

direct narratives do."* This writer, however, considers Hengist and his Saxons to have been the parties plotted against, and, in what they did, to have acted only on the defensive. The bloody congress appears to have taken place at Stonehenge, on a May-day. In the end, Eric, the son of Hengist, remained in possession of all Kent, and became the founder of the Kentish, or first Saxon kingdom, in our island.

The conquerors of "Cantwara Land," or Kent, seem to have been Jutes mixed with some Angles; but now the Saxons appeared as their immediate neighbours. In the year 477, Ella, the Saxon, with his three sons, and a formidable force, landed in the ancient territory of the Regni, now Sussex, at or near to Withering, in the isle of Selsey. The Britons, who had certainly recovered much of their martial spirit, made a vigorous resistance; but they were defeated with great slaughter, and driven into the forest of Andreade, or Andredswold.† According to the old writers, this forest was 120 miles long, and 30 broad; prodigious dimensions, which astonish us, although informed that even at the evacuation of the country by the Romans, a considerable portion of the island was covered with primeval woods, forests, and marshes. Continuing to receive accessions of force, Ella defeated a confederacy of the British princes, became master of nearly all Sussex, and established there the second kingdom, called that of the *South Saxons*. Taking the coast line, the invaders now occupied from the estuary of the Thames to the river Arun; and to obtain this short and narrow slip had cost them half a century. Cerdic, with another band of Saxons, extended the line westward a few years after, as far as the river Avon, by conquering Hampshire and the Isle of Wight; when he founded *Wessex*, or the kingdom of the *West Saxons*. The country to the west of the Hampshire Avon, remained for many years longer in possession of the Britons, who now yielded no ground without hard fighting.

The next important descent was to the north of the estuary of the Thames, where Ercenwine, about 527-9, took possession of the flats of Essex, with some of the contiguous country, and formed the state of the *East Saxons*. Other tribes carried their arms in this direction as far as the Stour, when there was a short pause, which was not one of peace, for the Britons, driven from the coasts, pressed them incessantly on the land side. About the year 547, Ida, at the head of a formidable host of Angles, landed at Flamborough Head, and leaving a long lapse on the coast between him and the East Saxons, proceeded to settle between the Tees and the Tyne, a wild country, which now includes the county of Durham, but which was then abandoned to the beasts of the forest. This conquest obtained the name of the *Kingdom of Bernicia*. Other invaders, again, stepped in between the Tees and the Humber, but it cost them much time and blood before they could establish their southern frontier on the Humber. Their possessions were called the *Kingdom of Deira*. At the end of the sixth century, a general emigration seems to have taken place from Anglen, or Old England; and under chiefs that have not left so much as a doubtful name behind them, the Angles, in two great divisions, called the Southfolk and the Northfolk, rushed in between the Stowe and the Great Ouse and Wash, and gave a lasting denomination to our two counties of Suffolk and Norfolk. Their conquest was called the *Kingdom of East Anglia*. The territory thus seized by the East Angles was almost insulated from the rest of the island, by a succession (on its western side) of bogs, meres, and broad lakes, connected, for the most part, by numerous streams. Where these natural defences ended, the East Angles dug a deep ditch, and cast up a lofty rampart of earth. In the middle ages this was called the "Giants' Dyke," a name which was afterwards changed into the more popular denomination of the "Devil's Dyke." The marshes upon which it leant have been drained, but the remarkable mound is still very perfect. The other Angles advanced from beyond the Humber, and fresh tribes pouring in from the peninsula of Jutland and Holstein, the territory now forming Lincolnshire, between the Wash and the Humber, was gradually but slowly conquered from the Britons, and the only lapse or chasm filled up, that existed in the Saxon line of coast, from the Hampshire Avon to the Northumbrian Tyne. This line was extended as far north as the Frith of Forth by the Angles of Bernicia and Deira, who were united under one sceptre, about the year 617, and thenceforward were called *Northumbrians*. All the western coast from the Frith of Clyde to the Land's End, in Cornwall, and the southern coast from the Land's End to the confines of Hampshire, remained unconquered by the Saxons. Such had been the security of Cornwall, and its indifference to the fate of the rest of the island, that, while the states of the south were falling one by one under the sword of the Saxon invaders, twelve thousand armed Britons left its shore to take part in a foreign war. This curious event took place about the year 470, when Gaul was overrun by the Visigoths, and Anthemius, who reigned in Italy, was unable to protect his subjects north of the Alps. He purchased or otherwise procured the services of Riothamus, an independent British king, whose dominion included, besides Cornwall, parts of Devonshire. The Britons sailed up the river Loire, and established themselves in Berry, where, acting as oppressive and insolent conquerors, rather than as friends and allies, they so conducted themselves, that the people were rejoiced when they saw them cut to pieces or dispersed by the Visigoths.*

The breadth of the Saxon territories or their frontiers inland, were long uncertain and wavering, now advancing, and now receding, according to the fortune of war. Under the name of *Myrcna-ric*,

* Britannia after the Romans, p. 46.

† The forest, or wold, is also called Anderida.

* Jornandes, cap. xlv. Sidonius, lib. iii. Epist. 9.

latinized *Mercia*,* a branch of the Angles, penetrating into the heart of the island, founded a kingdom that extended over all the midland counties, from the Severn to the Humber, and that pressed on the borders of Wales. In this district, however, the population was not destroyed or expelled; the Britons lived mixed up, in about equal numbers, with the Saxons. The Mercian Angles, who, at one period, had spread to the south and east, until they reached the Thames, and included London in their dominion, contributed most extensively to the conquest of the island, and formed a kingdom, which was one of the last of the Heptarchy to be overthrown or absorbed. During their power, the Mercians more than once followed the bold mountaineers of Wales, who maintained a constant hostility, right through their country to the shores of St. George's channel and the Irish sea; but they were never able to subdue that rugged land. The other Anglo-Saxons who seized their dominions in the ninth and tenth century, were not more successful than the Mercians; and although, at a later day, some of its princes paid a trifling tribute, and the country was reduced to its present limits of Wales and Monmouthshire, Cambria was never conquered by the Saxons during the six hundred years of their domination.†

The people of Strathclyde and Cumbria, which territories extended along the western coast from the Frith of Clyde to the Mersey and the Dee, appear to have been almost as successful as the Welsh, and by the same means. Their disposition was fierce and warlike, their hatred to the Saxons inveterate, and, above all, their country was mountainous and abounded with lakes, marshes, moors, and forests. Part of the territory of Strathclyde, moreover, was defended by a ditch and a rampart of earth. This work, which is popularly called the Catrail or the March Dykes, can still be traced from the Peel-fell, on the Borders, between Northumberland and Roxburghshire, to Galashiels, a little to the north of Melrose and the river Tweed, and near to Abbotsford.‡ In our Introduction we have stated the grounds there are for a belief that the Welsh and the occupants of Strathclyde and Cumbria were both the same people, and descended, not from the ancient Britons, but the Picts. But lower down on the western coast, the Saxon arms were more successful. Even there, however, the slowness of their progress denotes the sturdy resistance they met with. Nearly two centuries had elapsed since their landing at Thanet before they found their way into Dumnonia or Devonshire, which, together with Cornwall, appears to have remained in the occupation of a great undisturbed mass of British population. The King Cadwallader had resigned his earthly crown and gone to Rome as a pilgrim, in search of a crown of glory; disunited and disheartened, the nobles of the land fled beyond sea to Armorica or Britanny, and, at the approach of the invaders, hardly any were left to oppose them except the peasantry. From the traditions of the country, and the signs of camps, trenches, and fields of battle spread over it, we should judge that the rustics made a vigorous defence.* They made a stand on the river Exe; but, being routed there, retreated to the right bank of the Tamar, abandoning all the fertile plains of Devonshire, but still hoping to maintain themselves in the hilly country of Cornwall. Defeat followed them to the Tamar and the country beyond it, upon which they, in A.D. 647, submitted to the Anglo-Saxons, who by this time may be called the English.

In this rapid and general sketch of the Saxon conquest, which, from the dates that have been given, will be perceived to have occupied altogether a space of nearly 200 years,—of which above 100 were consumed even before the eastern and central parts of the island were subdued, and the last of the several new Saxon kingdoms established, a sufficient proof of the obstinate resistance of the Britons,—we have omitted all details of the achievements of the British champions, not excepting even—

> ——— "what resounds
> In fable or romance of Uther's son,"

as Milton has chosen to designate the history of the famous King Arthur. It seems impossible to arrive at any certainty with regard to the chronology or particular events of a period the only accounts of which are so dark and confused, and so mixed up and overrun with the most palpable fictions. But as to Arthur, there appear to be the strongest reasons for suspecting that he was not a real but only a mythological personage, the chief divinity of that system of revived Druidism which appears to have arisen in the unconquered parts of the west of Britain after the departure of the Romans, the name being often used in the poetry of the bards as the hieroglyphical representative of the system. This is the most important of the subjects upon which new light has been thrown by the researches of the author of 'Britannia after the Romans,' and his elaborate and masterly examination of the question of Arthur certainly seems to go very near to settle the controversy. "The 'Saxon Chronicle,'" he observes upon the several probabilities of the case (the only part of his argument to which we can here advert), "does not suppress the names of islanders with whom the Saxons had to deal, but mentions those of Vortigern, Natanleod, Aidan, Brochvael, Geraint, Constantime of Scots, and Cadwallon. Its author betrays no knowledge of Arthur's existence. The venerable Beda either never heard of it or despised it as a fable." Nor is it mentioned, he goes on to remark, either by

* "We are generally told that *Mercia* signifies the *march* or *frontier*—a signification peculiarly improper for a central country. *Myrcna-ric*, in the Anglo-Saxon, signifies the *woodland kingdom*, which agrees very closely with *Coitani*, the latinized name of the old British inhabitants, signifying *woodland men* or *foresters*."—Macpherson's *Annals of Commerce*, i. 237.

† A portion of Monmouthshire was, however, thoroughly conquered a short time before the Norman invasion, when the Saxons occupied the towns of Monmouth, Chepstow, Caerwent, and Caerleon.—*Coxe, Monmouthshire.*

Florence of Worcester or by Gildas. Yet, as he observes elsewhere, "the name of Arthur is so great, that if such a man ever reigned in Britain, he must have been a man as great as the circumscribed theatre of his actions could permit." And again; "The Arthurian era was one in the course of which the British frontier receded, and Hants, Somerset, and other districts passed for ever into the hands of the invader. It is not by suffering a series of severe defeats that any Saxon or other man conquers provinces; it is done by gaining successive victories. If Arthur lived and fought, he did so with a preponderance of ill success, and with the loss of battles and of provinces. But exaggeration must be built upon homogeneous truth. For a Cornish prince to be renowned through all countries, and feigned a universal conqueror, he must really have been a hero in his own land and a signal benefactor to it. No man was ever deified in song for being vanquished and losing half a kingdom. But the God of War would retain his rank in any case. . . The God of War would keep his station and preside over valiant acts, whether the results of war were fortunate or not. But the disasters of the British, historically and geographically certain as they are, make it also clear that they were commanded by no king fit for their bards to canonize."*

To bring the course of the invaders and the permanent settlement of the Anglo-Saxons under one point of view, we have glanced from the middle of the fifth to the middle of the seventh century. We may now retrace our steps over part of that dark and utterly confused interval, but in doing so we shall not venture into the perplexing labyrinth presented by the more than half fabulous history of the Heptarchy, or seven separate and independent states or kingdoms of the Anglo-Saxons. Modern writers have assumed, that over these separate states there was always a lord paramount, a sort of emperor of England, who might be by inheritance or conquest, sometimes the king of one state and sometimes the king of another. This ascendant monarch is called the Britwalda, or Bretwalda, a Saxon term which signifies the wielder, or dominator, or ruler, of Brit (Britain). According to Bede and the Saxon Chronicle, seven or eight of the Saxon princes in irregular succession bore

Arms and Costume of a Saxon Military Chief.—Designed from a Saxon Illumination in Bib. Harl. No. 603

this proud title; and perhaps it may be inferred from Bede's expressions that the other six kings of the island acknowledged themselves the vassals of the Bretwaldas. We are not thoroughly convinced of any such supremacy (even nominal), and in the real operations of war and government we continually find each state acting in an independent manner, as if separate from all the rest, a proof at least that the authority of the lord paramount was very limited or very uncertain. As, however, their whole history is uninteresting, and as it is easier to trace the reigns of the more marking monarchs than to enter into seven separate dynasties, we shall follow the modern example.

ELLA, the conqueror of Sussex, and the founder there of the kingdom of the South Saxons,—the smallest of all the new states,—was the first Bretwalda, and died, little noticed by the English chroniclers, about the year 510. After a long vacancy, CEAWLIN, king of Wessex, who began to reign about 568, stepped into the dignity, which, however, was contested with him, by ETHELBERT, the fourth king of Kent, who claimed it in right of his descent from Hengist, the brother of Horsa. The dispute led to hostilities; for long before the Anglo-Saxons had subdued all the Britons, they made fierce wars upon one another. The first example of this practice, which must have retarded their general progress in the subjugation of the island, was set by Ethelbert, who, after sustaining two signal defeats from his rival, and many other reverses, during the twenty-two years that Ceawlin reigned, acquired the dignity of Bretwalda (A.D. 593) soon after that prince's death. Ceawlin, by the law of the sword, had taken possession of the kingdom of Sussex, and seems to have fought as often against his Saxon brethren as against the Britons.

The grand incident under the reign of this, the third Bretwalda, was the conversion of himself and court by Augustine and forty monks, chiefly Italians, who were sent for that purpose into Britain, by Pope Gregory the Great. Ethelbert's change of religion was facilitated by the circumstance of his having espoused a Christian wife shortly before. This was the young and beautiful Bertha, sister or daughter of Charibert, king of Paris, to whom, by stipulation, he granted the free exercise of her religion when she came into the island. Ethelbert's close connexion with the more enlightened nations of the continent, and his frequent intercourse with French, Roman, and Italian churchmen, who, ignorant as they were, were infinitely more civilized than the Saxons, proved highly beneficial to England; and in the code of laws this prince published before his death, he is supposed to have been indebted to the suggestions and science of those foreigners, although the code has more of the spirit of the old German lawgivers than of Justinian and the Roman jurisconsults. This code was not octroyed, as from an absolute sovereign (a quality to which none of the Saxon princes ever attained), but was enacted by Ethelbert with the consent of the states of his kingdom of Kent, and formed the first written laws promulgated by any of the northern conquerors; the second being the code of the Burgundians, published a little later; and the third, that of the Longobardi or Lombards, which was promulgated in their dominions in the north of Italy, about half a century after Ethelbert's code. As king of Kent, Ethelbert's reign was a very long and happy one; as Bretwalda, he exercised considerable authority or influence over all the Saxon princes south of the Humber. He died in 616, and was succeeded, as king of Kent, but not as Bretwalda, by his son Eadbald. The Anglo-Saxons at this period were very volatile and fickle in their faith, or very imperfectly converted to the Christian religion. Passionately enamoured of the youth and beauty of his step-mother, Ethelbert's widow, Eadbald took her to his bed; and as the Christians reprobated such incestuous marriages, he broke with them altogether, and returned to his priests of the old Teutonic idolatry. The whole Kentish people turned with him, forsook the missionaries and the churches, expelled the Christian bishop, and again set up the rude altars of the Scandinavian idols. Such a relapse as this was not uncommon among the recently converted heathen of other countries, but the sequel is curious, and makes our Saxon ancestors appear like a flock of sheep following the bell-wether. Laurentius, the successor of Augustine in the archbishopric of Canterbury, prevailed on Eadbald to put away his step-mother and return to his fold; and no sooner had the king done so than all his subjects returned with him, without murmur or disputation.

We have said that Eadbald did not succeed to the dignity of Bretwalda. It appears, however, he made a claim to it, and that the other princes refused their concurrence and obedience. The dignity of Bretwalda would seem from this and other instances not to have been obtained by regular and free election, but to have been conceded to him who showed himself ablest to maintain his claim to it by the sword. The three first Bretwaldas, Ella, Ceawlin, and Ethelbert, were Saxons or Jutes, but now the dignity passed to the more powerful Angles in the person of REDWALD, about the year 617. Redwald was king of East Anglia, and a kind of a Christian, having been converted some years before by the Bretwalda Ethelbert. But his wife and people were attached to the old idolatry, and, yielding to their importunities, he re-opened the temples, taking care, however, to place a Christian altar by the side of the statue of Woden,* in doing which he no doubt hoped to conciliate both parties. During his reign the Scots, who had renewed hostilities in the North, were beaten by the now united and extended Saxon kingdom of Northumbria. At a later period Redwald himself was hostilely engaged with the Northumbrian king Edilfrid, who is said to have destroyed more Britons than all the other Saxon kings. The armies

* Bede.

of the Saxon kings met on the banks of the river Idel, in Nottinghamshire, where victory, after a sanguinary engagement, rested on the crest of the Bretwalda. Edilfrid was slain.

Edwin, the fifth Bretwalda, succeeded (about 621), in a somewhat irregular manner, both to the dignity of Redwald and the kingdom of Edilfrid; and so successful was he in his wars and his politics that he raised Northumbria to a superiority over all the Saxon kingdoms, thus transferring the ascendancy from the south to the north of the island. After wavering some time between the old national faith of the Saxons and Christianity, Edwin, as we shall afterwards have to relate more particularly, was converted by the preaching of Paulinus, a Roman missionary, and the influence of his fair wife Edilberga, who was daughter of Ethelbert, the Bretwalda and king of Kent, and a Christian, before she married Edwin. The happiest effects are asserted to have followed the conversion of the hitherto ferocious Northumbrians. "In this time," says one of the old chroniclers, "was so great peace in the kingdom of Edwin that a woman might have gone from one town to another without grief or noyaunce (molestation); and for the refreshing of way-goers, this Edwin ordained, at clear wells, cups or dishes of brass or iron to be fastened to posts standing by the said wells' sides; and no man was so hardy as to take away those cups, he kept so good justice."* Edwin added the Isles of Man and Anglesey to his Northumbrian dominions, and was so powerful that all the Saxon kings acknowledged his authority, and paid him a kind of tribute. According to some accounts, he also maintained a supremacy over the Scots and Picts. In writing to him, in the year 625, the Pope styles Edwin "Rex Anglorum,"—king of the Angles, or English. In his person the dignity of Bretwalda had a significant and clear meaning; but he did not hold it very long. About the year 633 Penda, the Saxon prince of Mercia, rebelled

* Fabyan.

Remains of the Abbey of Lindisfarne, Holy Island

against his authority, and, forming an alliance with Ceadwalla, or Cadwallader, the king of North Wales, he fought a great battle at Hatfield, or Heathfield, near the river Trent, in which Edwin was defeated and slain (A.D. 634). The alliance of one party of the Saxons with the Welsh to fight against another party of Saxons is remarkable, but the case was often repeated. The confederate armies between them committed a horrible slaughter, sparing neither old men nor children, women, nor monks. Cadwallader and the Welsh remained in the territory of the Northumbrians at York, but Penda marched into Norfolk against the East Angles. This people had embraced the Christian faith some seven years before at the earnest representations of the Bretwalda Edwin, and Sigebert, their old king, had lately renounced his crown to his cousin Egeric, and retired into a monastery. But at the approach of Penda and his pagan host the old soldier left his holy retirement and directed the manœuvres of his army, with a white rod or wand, his religious scruples not permitting him to resume the sword and battle-axe. Penda was as successful here as he had been against the Christians of Northumbria, and both Sigebert and Egeric fell in battle. At this time a struggle for supremacy seems to have existed between the converted and the unconverted Saxons; and Penda, as head of the latter, evidently aimed at possessing the full dignity of Bretwalda as it had been exercised by Edwin of Northumbria. But the latter prince had laid a broad and sure basis, which enabled the Northumbrians to retain the advantage in their own country, and transmit the dignity to two members of his family.

In the year 634, OSWALD, the nephew of Edwin, raised his banner in Northumbria, where Cadwallader, after many successes, seemed to despise precaution. He and his Welsh were surprised near Hexham, and totally defeated by inferior numbers. On the part of the Anglo-Saxons the battle began with kneeling and prayers; it ended, on the part of the Welsh, in the death of Cadwallader, whose detestable cruelty, cunning and treachery, prevent us from honouring his bravery or pitying his fall, and in the annihilation of his army, which appears to have assumed the title of "the invincible." Oswald being equally recognized by the two Northumbrian states of Bernicia and Deira, then regained all that his uncle Edwin had lost, and soon after most of the Saxons acknowledged him as Bretwalda. He attributed his success to the God he worshipped; and, to show his gratitude, he invited many monks to complete the conversion of the people of Northumbria. The donation of Lindisfarne, or Holy Island, and the magnificent monastery that rose there, testified to his munificence. Churches and monasteries sprung up in other parts of the North, and undoubtedly forwarded civilization, to a certain point, more than any other measures or establishments. Oswald, who repaired

ROCK OF BAMBORCUGH, WITH THE CASTLE IN ITS PRESENT STATE.

to the court of Cynegils, the king of that country, to demand his daughter in marriage, took an active part in the conversion of Wessex; and when Cynegils made a donation of land to Birinus, the Roman missionary and bishop, he confirmed it in his quality of Bretwalda.

As Bretwalda, Oswald exercised an authority over the Saxon nations and provinces fully equal to that of his uncle Edwin; and he is said, beside, although the fact is disputed, to have compelled the Pictish and Scottish kings to acknowledge themselves his vassals. Oswald was slain in battle (A.D. 642) like his uncle Edwin, and by the same enemy, the fierce and still unconverted Penda, king of Mercia, who was as desirous as ever of establishing his own supremacy. But the Northumbrians once more rallied round the family of the beloved Edwin, and on the retreat of the heathens from the well-defended rock of Bamborough, they enabled Oswald's brother, named Oswy, or Oswio, whose wife was the daughter of the great Edwin, to ascend the throne of his father-in-law. His succession, however, was not undisputed, nor did his murder of one of his competitors preserve the integrity of the Northumbrian kingdom. About the year 651 it was re-divided into its two ancient independent states; and whilst Oswy retained to himself Bernicia, the more northern half, Odelwald reigned in Deira, or the southern part. The disseverance was a fatal blow from which Northumbria never recovered.

Oswy had soon to contend with the old enemy of his house, the slayer of his two predecessors. Penda, still anxious to obtain the dignity of Bretwalda, which, as on other occasions, seems to have been in abeyance for some years, after driving the Christian king of Wessex from his throne (A.D. 652), advanced once more, and this time with fire and sword, into Northumberland. Burning every house or hut he found in his way, this savage marched as far as Bamborough. Trembling at his recollections of the past, and his present danger, Oswy entreated for peace, which he at at length obtained by means of rich presents, hostages, and an arrangement of intermarriage. His second son was sent as an hostage to Penda's court. Alchfrid, his eldest son, espoused one of Penda's daughters, and shortly after Penda's son, Peada or Weda, married one of Oswy's daughters, the fair and Christian Alchfreda, who carried four priests in her train, and became instrumental in converting the people of Mercia. "Thus," says Hume, "the fair sex have had the merit of introducing the Christian doctrine into all the most considerable kingdoms of the Heptarchy."

But as long as Penda was alive in the land there could be no lasting peace. Having desolated East Anglia (A.D. 654), he advanced once more against the Northumbrians, his army being swelled by the forces of thirty vassal kings or chieftains, Welsh or Cumbrians, as well as Saxons. This time gifts and offers were of no avail. Oswy was obliged to fight; and the hardest fought battle that had been seen for many years before took place between him and Penda not far from York. Here, at last, this scourge of Britain or England (for the first name is now scarcely appropriate) perished by that violent death he had caused so many princes, and thirty of his chief captains were slain with him. Another account is, that of the thirty vassal kings or chiefs who followed him to the field, only one escaped, and that this one was the King of Gwynedh, a state in North Wales, which seems to have comprised Cardiganshire, part of Merionethshire, and all Caernarvonshire. Twelve abbeys, with broad lands attached, showed the gratitude of Oswy for his unexpected victory; and, according to a custom which was now obtaining among all the northern conquerors, he dedicated an infant daughter to the service of God, and took her to the Lady of Hilda, who shortly after removed with her nuns from Hartlepool to the vale of Whitby, where there soon arose one of the most famed and splendid monasteries of the middle ages. But all the proceedings of the victor were not of so pious or tranquil a nature. After Penda's death Oswy rapidly overran the country of his old enemies the Mercians, on whom he inflicted a cruel vengeance. He attached all their territory north of the Trent to his Northumbrian kingdom; and Peada, his son-in-law, being treacherously murdered soon after (it is said by his own wife, who was Oswy's daughter), he seized the southern part of Mercia also. It was probably at this high tide of his fortune (A.D. 655) that Oswy assumed the rank of Bretwalda. The usual broad assertion is made, that the Picts and Scots, and the other natives of Britain, acknowledged his supremacy. There was soon, however, another Bretwalda; the first instance we believe of two such suns shining together in our hemisphere.

In 656 the eoldermen or nobles of Mercia rose up in arms, expelled the Northumbrians, and gave the crown to Wulfere, another of Penda's sons, whom they had carefully concealed from the eager search of Oswy. This Wulfere not only retained possession of Mercia, but extended his dominions by conquests in Wessex and the neighbouring countries; after which he became king of all the "Australian regions," or Bretwalda in all those parts of the island that lie south of the Humber. About the same time Oswy was further weakened by the ambition of his eldest son Alchfrid, who demanded and obtained a part of Northumbria in independent sovereignty. The sickness called the yellow, or the yellers plague, afflicted Oswy and his enemies alike; for it began in the south, gradually extended to the north, and at length raged over the whole island with the exception of the mountains of Caledonia. Among the earliest victims of this pestilence were kings, archbishops, bishops, monks, and nuns. As the plague now makes its appearance annually in some of the countries of the East, so did this yellow sickness break out in our island for twenty years. King Oswy, who is generally considered the last of the Bret-

waldas, though others continue the title to Ethelbald, king of Mercia, died in 670, during the progress of this fearful disease, but not of it.

Although we here lose the convenient point of concentration afforded by the reigns of the Bretwaldas, it is at a point where the seven kingdoms of the Heptarchy had merged into three; for the weak states of Kent, Sussex, Essex, and East Anglia, were now reduced to a condition of vassalage by one or the other of their powerful neighbours; and the great game for supreme dominion remained in the hands of Northumbria, Mercia, and Wessex. We are also relieved from any necessity of detail. The preceding narrative will convey a sufficient notion of the wars the Anglo-Saxon states waged with one another; and as we approach the junction of the three great streams of Northumbria, Mercia, and Wessex, which were made to flow in one channel under Egbert, we shall notice only the important circumstances that led to that event.

Oswy was succeeded in the greater part of his Northumbrian dominions by his son Egfrid, who was scarcely seated on that now tottering throne when the Picts seated between the Tyne and the Forth broke into insurrection. With a strong body of cavalry, Egfrid defeated them in a bloody battle, and again reduced them to a doubtful obedience. Some eight years after, ambitious of obtaining all the power his father had once held, Egfrid invaded Mercia. A drawn battle was fought (A.D. 679) by the rival Saxons on the banks of the Trent, and peace was then restored by means of a holy servant of the church; but it was beyond the bishop's power to restore the lives of the brave who had fallen, and whose loss sadly weakened both Mercia and Northumbria. In 685 Egfrid was slain in a war with Brude, the Pictish king; and the Scots and some of the northern Welsh joined the Picts, and carried their arms into England. In the exposed parts of Northumbria the Anglo-Saxons were put to the sword or reduced to slavery, and that kingdom became the scene of wretchedness and anarchy. In the course of a century fourteen kings ascended the throne in a manner as irregular as their descent from it was rapid and tragical. Six were murdered by their kinsmen or other competitors, five were expelled by their subjects, two became monks, and one only died with the crown on his head.

Although exposed, like all the Anglo-Saxon states, to sanguinary revolutions in its government, Mercia, the old rival of Northumbria, for a considerable period seemed to rise on the decline of the latter, and to bid fair to be the victor of the three great states. After many hardly-contested battles the kings of Wessex were reduced to serve as vassals, and by the year 737 ETHELBALD, the Mercian king, ruled with a paramount authority over all the country south of the Humber, with the exception only of Wales. But five years after the vassal state asserted its independence, and in a great battle at Burford, in Oxfordshire, victory declared for the Golden Dragon, the standard of Wessex. Between the years 757 and 794 the superiority of Mercia was successfully re-asserted by King Offa, who, after subduing parts of Sussex and Kent, invaded Oxfordshire, and took all that part of the kingdom of Wessex that lay on the left of the Thames. Then turning his arms against the Welsh, he drove the kings of Powis from Pengwern (now Shrewsbury) beyond the river Wye, and planted strong Saxon colonies between that river and the Severn. To secure these conquests and protect his subjects from the inroads and forays of the Welsh, he resorted to means that bear quite a Roman character. He caused a ditch and rampart to be drawn all along the frontier of Wales (a line measuring 100 miles), beginning at Basingwerke in Flintshire, not far from the mouth of the Dee, and ending on the Severn near Bristol. There are extensive remains of the work, which the Welsh still call "Clawdh Offa," or Offa's Dyke. But the work was scarcely finished when the Welsh filled up part of the ditch, broke through the rampart, and slew many of Offa's soldiers while they were pleasantly engaged in celebrating Christmas. Offa the Terrible, as he was called, took a terrible vengeance. He met the mountaineers at Rhuddlan, and encountered them in a battle there, in which the king of North Wales, and the pride of the Welsh youth and nobility, were cut to pieces. The prisoners he took were condemned to the harshest condition of slavery. Master of the south, it is said that he now compelled the Northumbrians beyond the Humber to pay him tribute; but the year is not mentioned, and the fact is not very clear. Ten years of victory and conquest, say his monkish eulogists, neither elated him nor swelled him with pride; "yet," adds one of them, "he was not negligent of his regal state; for that, in regard of his great prerogative, and not of any pride, he first instituted and commanded, that even in times of peace, himself, and his successors in the crown, should, as they passed through any city, have *trumpeters going and sounding before them*, to show that the presence of the king should breed both fear and honour in all who either see or hear him.*" We would forgive him the trumpets, cracked and out of tune as they might be; but Offa, in reality, had the worst kind of pride—the most insatiable ambition; and he was guilty of a series of cruel and treacherous murders that makes the heart shudder, even in the midst of these barbarous annals, where almost every alternate page is soaked through and through with blood. William of Malmesbury declares he is at a loss to determine whether the merits or crimes of this prince preponderated; but as Offa was a most munificent benefactor to the church, the monks in general (the only historians of those times) did not partake of this scruple, and praised him to excess. As a sovereign, however, Offa had indisputable and high merits, and the

* The Ligger Book of St. Alban's, as quoted in Speed's Chronicles.

country made some progress under his reign and by his example. He had some taste for the elegancies of life and the fine arts; he built a palace at "Tamworth Town," which was the wonder of the age; and his medals and coins are of much better taste and workmanship than those of any other Saxon monarch.* He maintained an epis-

Silver Coin of Offa.—From British Museum.

tolary correspondence with Charlemagne; and it is highly interesting, and a consoling proof of progression, to see the trade of the nation and the commercial intercourse between England and France made a subject of discussion in these royal letters. When, towards the close of his reign, his body being racked with disease and his soul with a late remorse, he gave himself up to monkish devotion and superstitious observances, there was still a certain taste as well as grandeur in his expiatory donations, and a remarkable happiness of choice (though this is said to have been directed by the accidental discovery of a few bones) in his site for the Abbey of St. Alban's, the most magnificent of all the ecclesiastical edifices he erected.† According to some of the old writers, his last warlike exploit was the defeat of a body of Danish invaders; and it is generally allowed that, during the latter part of his reign, a few ships' crews, the precursors of those hordes that desolated England soon after, effected a landing on our coast, and did some mischief. On the death of Offa, after a long reign, in the year 795, the great power of Mercia, which his craft, valour, and fortune had built up, and which his energies alone had supported, began rapidly to decline; and as Northumbria continued in a hopeless condition, Wessex, long the least of the three great rival states, soon had the field to herself.

At the time of Offa's death the throne of Wessex was occupied by Brihtric, or Beortric, whose right was considered very questionable even in those days, when the rule of succession was very far from being settled. Egbert, the son of Alchmund, had a better title but fewer partisans; and, after a short and unsuccessful struggle for the crown, he fled for his life, and took refuge in the court of Offa, the Mercian. His triumphant rival, Beortric, then despatched ambassadors into Mercia charged with the double duty of demanding the hand of Eadburgha, one of Offa's daughters, and the head of Egbert. Offa readily gave his daughter (he could hardly have given a greater curse), but he refused the second request. He, however, withdrew his protection from his royal guest, who fled a second time for his life. Egbert repaired to the court or camp of the Emperor Charlemagne, who received him hospitably, and employed him in his armies. During a residence of fourteen or fifteen years on the continent, living chiefly among the French, who were then much more polished than the Saxons, Egbert acquired many accomplishments; and, whether as a soldier or statesman, he could not have found a better instructor than Charlemagne. Eadburgha, the daughter of Offa, and wife of Beortric, was a woman of a most depraved character,—incontinent, wanton, perfidious, and cruel. When men thwarted her love or otherwise gave her offence, she armed the uxorious king against them; and when he would not be moved to cruelty, she became the executioner of her own vengeance. She had prepared a cup of poison for a young nobleman who was her husband's favourite; by some inadvertence this was so disposed that the king drank of it as well as the intended victim, and died a horrid death (A.D. 800). According to another version of the story she had filled the bowl expressly for the king, and many of his householders and warriors were poisoned by it. The crime was discovered, and the queen degraded and expelled; the thanes and men of Wessex decreeing, at the same time, that for the future no king's wives should be called queens, nor suffered to sit by their husbands' sides upon the throne. She also took refuge with Charlemagne, who assigned her a residence in a convent or abbey. But in process of time she began to conduct herself so viciously, that she was turned out of this place of shelter. Some years after her expulsion a woman of foreign mien, and faded beauty, was seen begging alms in the streets of Pavia, in Italy; it was Eadburgha, the widow of the king of the West Saxons,—the daughter of Offa, monarch of all England south of the Humber. It is believed she ended her days at Pavia.

As soon as Egbert learned the death of Beortric, he returned from France to Wessex, when the Thanes and the people received him with open arms. The first years of his reign were employed in establishing his authority over the inhabitants of Devonshire and Cornwall; but he had then to meet the hostility of the jealous Mercians, who invaded Wessex with all their forces. Egbert met them at Elyndome, or Ellandum, near Wilton, in Wiltshire, with an army very inferior in numbers, but in superior fighting condition; being, to use the expression of one of our quaint old chroniclers, "lean, meagre, pale, and long-breathed," whereas the Mercians were "fat, corpulent, and short-winded." He gained a complete victory, and was soon after enabled to attach Mercia and all its dependencies to his kingdom. He established sub-reguli, or under-kings, in Kent and East Anglia; and, not satisfied with the dominion of the island south of the Humber, he crossed that river, and penetrated into the heart of Northumbria. He invaded that once powerful state when anarchy was

† The present venerable Abbey Church of St. Alban's, which stands on the site of that erected by Offa, was built three centuries later, by William Rufus. A considerable portion of the materials employed are Roman bricks or tiles taken from the ruins of the ancient city of Verulamium, which stood in the neighbourhood.

at its height. Incapable of resistance, the Northumbrians made an offer of entire submission (A.D. 825); and Eanred, their king, became the vassal and tributary of the great monarch of Wessex. It appears, however, that Egbert granted much milder terms of dependence to the Northumbrians than to any of the rest.

SILVER COIN OF EGBERT.—From British Museum.

Thus, in the first quarter of the ninth century, and three hundred and seventy-six years after the first landing of Hengist and Horsa, was effected what some historians call the reduction of all the kingdoms of the Heptarchy under one sovereign. EGBERT, however, did not assume the title of King of England. He contented himself with the style of King of Wessex, and with the dignity and authority of Bretwalda. This authority was sometimes questioned or despised in more than one part of the kingdom; but counting from the river Tweed to the shores of the British Channel and the extremity of Cornwall, there were none could make head against him; and during the last ten years of his reign he possessed, or absolutely controlled, more territory, not only than any Saxon sovereign that preceded him, but than any that followed him. Even Wales, if not conquered, was at one time coerced and kept in a dependent state.

But no sooner had England made some approaches towards a union and consolidation, and the blessings of a regular government, than the Danes or Northmen appeared in force, and began to throw everything into confusion and horror. In the year 832, when Egbert was in the plenitude of his power, a number of these ferocious pirates landed in the Isle of Sheppey, and having plun-

ARMS AND COSTUME OF DANISH WARRIORS.

dered it escaped to their ships without loss or hinderance. The very next year the marauders landed from thirty-five ships, and were encountered by the brave and active Egbert at Charmouth, in Dorsetshire. The English were astonished at the ferocity and desperate valour of these new foes, who, though they lost great numbers, maintained their position for awhile, and then made good their retreat to their ships. Indeed, some accounts state that Egbert's army was defeated in the engagement; that two chief captains and two bishops were slain; and that Egbert himself only escaped by the covert of night. In cruising along the English coasts, where they frequently landed in small bodies at defenceless places, the robbers of the North formed an acquaintance with the inhabitants of Cornwall, which ended in an ill-assorted alliance. The rugged promontory which stretches out to the Land's End had never been invaded by the Saxon conquerors of the island until the comparatively recent period of 647, and even then, as we have shown, the native population there was not much disturbed. As recently as 809 Egbert had invaded their territory, where he found them in such force and spirit that he lost many of his troops before he could reduce them to a nominal obedience. They must even now have been numerous and warlike, for on the stipulated landing in their territory of their Danish allies, in 834, they joined them in great force, and marched with them into Devonshire, where they found many old Britons equally willing to rise against the Saxons who had settled among them. But Egbert was again on the alert. He met them with his well-appointed army at Hengsdown-hill, and defeated them with enormous slaughter.

This was the last martial exploit of Egbert, who died in 836, after a long reign. The kingdom he had in a manner built up out of many pieces began to fall asunder almost before his coffin was deposited in the church of Winchester. He was succeeded by his eldest surviving son Ethelwulf, one of the first operations of whose government was to give the kingdom of Kent, with its dependencies, Sussex and Essex, in separate sovereignty to his son Athelstane. * He retained Wessex; but Mercia, which Egbert had subdued, again started into independence; and thus, when union was becoming more and more necessary, to face an enemy as terrible to the Saxons as the Saxons had been to the Britons, the spirit of disunion, jealousy, and discord assumed a fatal ascendancy.

Silver Coin of Ethelwulf

* Ethelwulf had been sub-regulus of Kent under his father, but then he was in reality subordinate to Egbert, who maintained full authority. It is not quite clear whether Athelstane was the eldest son or the brother of Ethelwulf.

The Scandinavian pirates soon found there was no longer an Egbert in the land. They ravaged all the southern coasts of the kingdoms of Wessex and Kent; they audaciously sailed up the Thames and the Medway; and stormed and pillaged London, Rochester, and Canterbury. The idea of the need of a common co-operation at last suggested itself, and a sort of congress composed of the bishops and thanes of Wessex and Mercia, was held at Kingsbury, in Oxfordshire (A.D. 851). Some energetic, and for the most part successful measures followed these deliberations. Barhulf, King of Mercia, was defeated and slain; but Ethelwulf and his son Ethelbald, at the head of their men of Wessex, gained a complete victory over the Danes at Okeley, in Surrey, and achieved such a slaughter as those marauders had never before suffered in any of the several countries they had invaded. Soon after Athelstane, the King of Kent, with Alchere, the Eolderman, defeated the pirates, and took nine of their ships at Sandwich. The West of England also contributed a victory; for Ceorl, with the men of Devon, defeated the Danes at Wenbury. These severe checks, together with the disordered state of France, which favoured their incursions in that direction, where they soon laid Paris in ashes, seem to have induced the marauders to suspend for awhile their great attacks on England; but such was the mischief they had done, and the apprehensions they still inspired, that the Wednesday of each week was appointed as a day of public prayer to implore the Divine assistance against the Danes. During the confusion their attacks caused in England, the Welsh many times descended from their mountains, and fell upon the Saxons. Ethelwulf is said to have taken vengeance for this, by marching through their country as far as the Isle of Anglesey, and compelling the Welsh to acknowledge his authority; but precisely the same stories are vaguely related (as this is) of several Saxon kings, who certainly never preserved any conquest or authority there for any length of time.

Ever since their conversion the Saxons of superior condition had been singularly enamoured of journeys or pilgrimages to Rome; and besides the prelates who went upon business, many princes and kings, crowned or uncrowned and dethroned, had told their orisons before the altar of St. Peter. Ethelwulf, whose devotion was fervent, though his sense of some moral duties was languid, now felt the general desire, and, as the island was tranquil, he passed over to the continent (A.D. 853), and, crossing the Alps and the Apennines, arrived at Rome, where he was honourably received, and tarried nearly one year. On his return, forgetting that he was an old man, he became enamoured of Judith, the fair and youthful daughter of Charles the Bald, king of the Franks, and espoused that princess with great solemnity in the cathedral of Rheims, where he placed her by his side, and caused her to be

crowned as queen. Athelstane, his eldest son, was dead, but Ethelwulf had still three sons of man's estate,—Ethelbald, Ethelbert, and Ethered, besides Alfred, then a boy, who was destined to see his brothers ascend and descend the throne in rapid succession, and to become himself "the Great." From the usual thirst for power, it is probable that, before this French marriage, Ethelbald, who was already intrusted with the government of part of his father's kingdom, was anxious to possess himself of the whole; but the marriage and the circumstances attending it gave plausible grounds of complaint, and Prince Ethelbald, Adelstane, bishop of Sherborn, Enwulf, earl of Somerset, and the other thanes and men of Wessex that joined in a plot to dethrone the absent king, set forth in their manifesto that he had given the name and authority of queen to his French wife, had seated her by his side on the throne, and "*openly eaten with her at the table;*" all which was against the constitution and laws of Wessex, which had for ever abolished the queenly dignity in consequence of the crimes of Eadburgha. It is probable also that the favour shown to the boy Alfred had some share in Ethelbald's resentment. Ethelwulf had carried his favourite son with him to Rome, where the Pope anointed him as king with holy oil, and with his own hands. It is more than likely that Alfred had always been destined by his father to fill a minor throne in the kingdom, but this act, and the wonderful estimation the oil of consecration was held in, in those days, especially when administered by the Pontiff of the Christian world, may have induced his brothers to suspect that the Benjamin of the family was to be preferred to them all. A recent historian—an indefatigable searcher into the old chronicles and records of the kingdom—is of opinion that, though the fact is not mentioned in express terms in our ancient historians, Osburgha, his first wife, and the mother of his children, was not dead at the time, but merely put away by Ethelwulf to make room for Judith.* In spite of their devotion and zeal for the church, such proceedings were not uncommon among kings in the middle ages; but if Ethelwulf so acted, the undutifulness of his eldest son, who had a mother's wrongs to avenge, would appear the more excusable. Whatever were their motives and grievances, a formidable faction, in arms, opposed Ethelwulf when he returned to the island with his young bride. Yet the old king had many friends; his party gained strength after his arrival among them, and it was thought he might have expelled Ethelbald and his adherents. But the old man shrunk from the accumulated horrors of a civil war waged between father and son, and consented to a compromise, which, on his part, was attended with great sacrifices. Retaining to himself the eastern part of the kingdom of Wessex, he resigned all the western, which was considered the richer and better portion, to Ethelbald. "And this unequal division," says Speed, "gave great suspicion that the revolt was rather grounded upon ambition than any inclination they had for their laws." Ethelwulf did not long survive this partition, dying in 857, in the twenty-first year of his reign.

ETHELBALD then not only succeeded to the whole of his father's kingdom, but to his young widow also; for, according to the chroniclers, howsoever unwilling he had been that this fair queen should sit in state by his father's side, yet, contrary to all laws both of God and man, he placed her by his own, and by nuptial rites brought her to his sinful and incestuous bed. A tolerably well-grounded supposition that Judith was only twelve years old when Ethelwulf married her, and that their marriage had never been consummated, may diminish our horror; but such a union could in no sense be tolerated by the Romish Church, which, by means of its bishops in England, at last gained Ethelbald's reluctant consent to a divorce. According to other old authorities, the marriage was only dissolved by his death, and priests and people generally attributed the shortness of his reign, which did not last two years, to the sinful marriage, which had drawn down God's vengeance. As she is connected by her posterity with many succeeding ages of our history, we must devote a few words to the rest of the chequered career of Judith. Either on her divorce, or at the death of Ethelbald, she retired to France, and lived some time in a convent at Senlis, a few miles to the north of Paris. From this convent she either eloped with, or was forcibly carried off by, Baldwin, the grand forester of Ardennes. Her father, Charles the Bald, made his bishops excommunicate Baldwin for having ravished a widow; but the Pope took a milder view of the case, and by his mediation the marriage of the still youthful Judith with her third husband was solemnized in a regular manner, and the earldom of Flanders was bestowed on Baldwin. Judith then lived in great state and magnificence: her son, the second earl of Flanders, espoused Elfrida, the youngest daughter of our Alfred the Great, from whom, through five lineal descents, proceeded Maud, or Matilda, the wife of William the Conqueror, from whom again descended all the subsequent kings of England.

Ethelbald was succeeded in the kingdom of Wessex by his brother ETHELBERT, who had a short reign, troubled beyond measure by the Danes, who now made inroads in almost every part of the island. He had the mortification to see them burn Winchester, his capital, and permanently establish themselves in the Isle of Thanet, which they made their nucleus, and the key of their conquests, just as the Saxons had done more than four centuries before. This king died in the year 866 or 867, and was succeeded by his brother ETHELRED, who, in the course of one year, had to fight nine pitched and murderous battles against the Danes. Whilst he was thus busied in resisting the invaders in the south and west parts of the island, the kings and

* According to some of the chroniclers, the Queen Osburgha was alive twenty-seven years after Ethelwulf's marriage with Judith, and in 878 repaired to Athelney, in Somersetshire, the retreat of her son Alfred.

chiefs of Mercia and Northumbria wholly withdrew from their covenanted subjection or alliance, and, only thinking of themselves, they gave no timely aid to one another or to the common cause. Thus left to their own resources, the men of Wessex maintained a doubtful struggle, at times losing, and at others gaining battles. According to the old writers, the destruction of the Danes was immense; and during the five or six years of Ethelred's reign there were killed in the field nine yarls or earls, one king, "besides others of the meaner sort without number." But this loss was constantly supplied by fresh forces from the north, who brought as eager an appetite for plunder as their precursors, and whose vengeance became the more inflamed as the number of deaths of their brethren was increased. In most of these conflicts Alfred, who was already far more fitted to command, fought along with Ethelred, the last of his brothers; and at Aston or Ashenden, in Berkshire, while the king was engaged at his prayers, and would not move with his division of the Saxon army till mass was over, Alfred sustained the brunt of the whole Danish force, and mainly contributed to a splendid victory. The victory of Aston was followed by the defeats of Basing and Mereton; and, soon after, Ethelred died (871), at Whittingham, of wounds received in battle, upon which the crown fell to Alfred, the only surviving and the best of all the sons of Ethelwulf. But, under existing circumstances, the crown was a jewel of no price, and for many years the hero had to fight for territory and for life against the formidable Danes.

The piratical hordes called Danes, or Norsemen by the English, Normans by our neighbours the French, and Normanni by the Italians, were not merely natives of Denmark, properly so called, but belonged also to Norway, Sweden, and other countries spread round the Baltic sea. They were offshoots of the great Scandinavian branch of the Teutons, who, under different names, conquered and re-composed most of the states of Europe on the downfall of the Roman empire. Such of the Scandinavian tribes as did not move to the south and the west to establish themselves permanently in fertile provinces, but remained in the barren and bleak regions of the north, devoted themselves to piracy as a profitable and honourable profession. The Saxons, then scattered along the south of the Baltic, did this in the fourth and fifth centuries, and now, in the ninth century, they were becoming the victims of their old system, carried into practice by their kindred the Danes, Swedes, Norwegians, and others. All these people were of the same race as the Saxons, being an after-torrent from the same Scandinavian fountain-head; and though time, and a change of country and religion on the part of the Anglo-Saxons had made some difference between them, the common resemblance in physical appearance, language, and other essentials, was still strong. It is indeed remarkable that the three different conquests of England made in the course of six centuries, were all the work of one race of men, bearing different names at different epochs; for the Normans of the eleventh century were called Danes in the ninth, and were of the same stock as the Danes and Saxons they subdued in England. A settlement of 200 years in France, and an intermixture with the people of that country, had wonderfully modified the Scandinavian character, but still the followers of William the Conqueror had a much greater affinity with the Danes and Anglo-Saxons than is generally imagined.

Hume and other historians are of opinion that the remorseless cruelties practised by Charlemagne from the year 772 to 803, upon the Pagan Saxons settled on the Rhine and in Germany, were the cause of the fearful reaction and the confirmed idolatry of that people.* There can be little doubt that this was partly the case; and it is a well-established fact that the Northmen or Normans made the imbecile posterity of Charlemagne pay dearly for their father's cruelty. Retreating from the arms, the priests, and the compulsory baptisms of this conqueror, many of these Saxons fixed their homes in the peninsula of Jutland, which had been nearly evacuated three centuries before by the Jutes and Angles who went to conquer England. A mixed population, of which the Jutes formed the larger portion, had, however, grown up in the interval on that peninsula, and, as they were unconverted, they were inclined to give a friendly reception to brethren suffering in the cause of Woden. The next step was obvious, and in the reprisals made on the French coasts, which were ravaged long before those of England were touched, the men of Jutland were probably joined by many of their neighbours from the mouth of the Baltic, the islands of Zeland, Funen, and the islets of the Cattegat. All these might probably be called Danes; but there are reasons for believing that the invaders of our island, under Alfred and his predecessors, were chiefly Norwegians and not Danes; and that the real Danish invasions, which ended in final conquest, were not commenced until nearly a century later. Our old chroniclers, who applied one general name to all, call Rollo "the Ganger," one of the most formidable of our invaders, a Dane, and yet it is well ascertained that he was a Norwegian nobleman. It is difficult, however, and not very important, to distinguish between two nations speaking the same language and having the same manners and pursuits. All the maritime Scandinavian tribes, from Jutland to the head of the Baltic,—from Copenhagen nearly to the North Cape,—were pirates alike; and the fleet that sailed from the coasts of Norway would often be mixed with ships from Jutland and Denmark, and *vice versâ*. Moreover, on certain great occasions, when their highest numerical force was required, the "Sea-kings," the leaders of these hordes, were known to make very extensive leagues.

* Charlemagne massacred the Saxons by thousands, even after they had laid down their arms. The alternative he offered was death or a Christian baptism. Those who renounced their old gods, or pretended to do so, he sent in colonies into the interior of France. Some were even hurried into Italy.

In their origin the piratical associations of the Northmen partook somewhat of the nature of our privateering companies in war-time, but still more closely resembled the associations of the Corsairs of the Barbary coast, who, crossing the Mediterranean as the Danes and Norwegians did the German Ocean and the British Channel, for many ages plundered every Christian ship and country they could approach. The governments at home, such as they were, licensed the depredations, and partook of the spoils, having, as it seems, a regularly fixed portion allotted them after every successful expedition. Like the Saxons we have described, the Danes, the Norwegians, and all the Scandinavians were familiar with the sea and its dangers, and expert mariners. Every family had its boat or its ship, and the younger sons of the noblest of the land had no other fortune than their swords and their chiules (keels). With these they fought their way to fame and fortune, or perished by the tempest or battle, which were both considered most honourable deaths. All the males were practised in the use of arms from their infancy, and the art of war was cultivated with more success than by any nation in Europe. The astonishing progress of the Danes (as they were called) in England, of the Normans in France, and later, in Italy and Sicily, not only prove their physical vigour, their valour and perseverance, but their military skill and address. Their religion and literature (for they had a literature at least as early as the eighth century) were subservient to the ruling passions for war and plunder, or, more properly speaking, they were both cast in the mould of those passions, and stamped with the deep impress of the national character. The blood of their enemies in war, and a rude hospitality, with a barbarous excess in drinking, were held to be the incense most acceptable to the god Woden, who himself had perhaps been nothing more than a mighty slayer and drinker. War and feasting were the constant themes of their scalds or bards; and what they called their history, which is mixed with fable to such a degree that the fragments remaining of it are seldom intelligible, recorded little else than piracy and bloodshed. Like their brethren the Saxons, they were not at one time very bigoted, or very intolerant to other modes of faith, but when they came to England, they were embittered by recent persecution, and they treated the Saxons as renegadoes who had forsaken the faith of their common ancestors to embrace that of their deadly enemies. This feeling was shown in their merciless attacks on priests, churches, monasteries, and convents.

With good steel arms the Danes were abundantly provided. Their weapons seem to have been much the same as those used by the Saxons at their invasion of the island, but the Scandinavian mace and battle-axe were still more conspicuous, particularly a double-bladed axe. "To shoot well with the bow" was also an indispensable qualification to a Danish warrior; and as the Saxons had totally neglected archery, it should seem the English were indebted to the conquest, and intermixture with them, of the Danes for the high fame they afterwards enjoyed as bowmen. They had great skill in choosing and fortifying the positions they took up. Wherever a camp was established, a ditch was dug, and a rampart raised with extraordinary rapidity; and all the skill and bravery of the Saxons were generally baffled by these intrenchments. Their ships were large and capable of containing many men; but in most of their expeditions they were attended by vessels drawing little water, that could easily run up the creek sand rivers of our island. Many of our rivers, however, must have been deeper in those times, for we constantly hear of their ascending such as would not now float the smallest embarkation. They frequently drew their vessels on shore, and having formed an intrenchment around them (as Cæsar had done with his invading fleet), they left part of their force to guard them, and then scattered themselves over the country to plunder and destroy. On many occasions they dragged their vessels overland from one river to another, or from one arm of the sea to another inlet.

If they met a superior force, they fled to their ships, and disappeared; for there was no dishonour in retreat, when they carried off the pillage they had made. They then suddenly appeared on some other distant or unprepared coast, and repeated the same manœuvres; thus, at length, as their numbers increased more and more, keeping every part of England in a constant state of alarm, and preventing the people of one country from marching to the assistance of those of another, lest in their absence their own district should be invaded, and their own families and property fall the victims of the marauders. The father and brothers of Alfred had established a sort of local district militia; but the same causes of self-interest and alarm continued, and it was seldom that a sufficient force could be concentrated on one point, in time to prevent the depredations of the pirates. On some occasions, however, these armed burghers and peasants, throwing themselves between the Danes and their ships, recovered the booty, and inflicted a fearful vengeance; quarter was rarely given to the defeated invaders. For a considerable time, the Danes carefully avoided coming to any general engagement; for, like the Picts and Scots of old, their object was merely to make forays, and not conquests and settlements. Their success, with the weakness and divisions of England, gradually enlarged their views. They brought no horses with them; but as cavalry was necessary to scour the country, and an important component of an armed force, they seized and mounted all the horses they could catch; and as their operations extended in-land, their first care was to provide themselves with those animals, for the procuring of which they would promise neutrality or an exemption from plunder, to the people or districts that furnished them. Thus, on one occasion, the men

of East Anglia mounted the faithless robbers, who rushed upon the men of Mercia, vowing they would not injure the horse-lenders. But no promises or vows were regarded,—no treaty was kept sacred by the Danes, who had always the ready excuse (when they thought fit to make one), that the peace or truce was broken by other bands, over whom those who made the treaty had no control. Thus, when the men of Kent resorted to the fatal expedient of offering money for their forbearance, the Danes concluded a treaty, took the gold, and, breaking from their permanent head-quarters in the Isle of Thanet, ravaged the whole of their country shortly after. The old writers continually call them "truce-breakers;" and the Danes well deserved the name.

We need not follow the gradual development of this sanguinary story, nor trace, step by step, how the Danes established themselves in the island. It will be enough to show their possessions and power on the accession of Alfred to the degraded throne. They held the Isle of Thanet, which gave them the command of the river Thames and the coasts of Kent and Essex; they had thoroughly overrun or conquered all Northumbria, from the Tweed to the Humber; they had planted strong colonies at York, which city, destroyed during the wars, they rebuilt. South of the Humber, with the exception of the Isle of Thanet, their iron grasp on the soil was less sure, but they had desolated Nottinghamshire, Lincolnshire, Cambridgeshire, Norfolk, and Suffolk; and, with numbers constantly increasing, they ranged through the whole length of the island, on this side the Tweed, with the exception only of the western counties of England, and had established fortified camps between the Severn and the Thames. The Anglo-Saxon standard had been gradually retreating towards the south-western corner of our island, which includes Somersetshire, Devonshire, and Cornwall, and which was now about to become the scene of Alfred's most romantic adventures. For awhile, the English expected the arrival of their foes during the spring and summer months, and their depar-

ture at the close of autumn; but now a Danish army had wintered seven years in the land, and there was no longer a hope of the blessing of their ever departing from it.

But Alfred, the saviour of his people, did not despair, even when worse times came: he calmly abode the storm over which his valour, but still more his prudence, skill, and wisdom finally triumphed. Though only twenty-three years of age, he had been already tried in many battles. He had scarcely been a month on the throne, when his army, very inferior in force to that of the Danes, was forced into a general engagement at Wilton. After fighting desperately through a great part of the day, the heathens fled; but seeing the fewness of those who pursued, they set themselves to battle again, and got the field. Alfred was absent at the time, and it is probable his army was guilty of some imprudence; but the Danes suffered so seriously in the battle of Wilton, that they were fain to conclude a peace with him, and evacuate his kingdom of Wessex, which they hardly touched again for three years. The invading army withdrew in the direction of London, in which city they passed the winter. In the following spring, having been joined in London by fresh hosts, both from Northumbria and from their own country, they marched into Lyndesey, or Lincolnshire, robbing and burning the towns and villages as they went, and reducing the people, whose lives they spared, to a complete state of slavery. From Lincolnshire they marched to Derbyshire, and wintered there at the town of Repton.

The next year (A.D. 875) one army under Halfden, or Halfdane, was employed in settling Northumbria, and in waging war with that probably mixed population that still dwelt in Cumberland, Westmoreland, and Galloway, or what was called the kingdom of Strathclyde. They now came into hostile collision with the Scots, who were forced to retreat beyond the Friths of Clyde and Forth. Halfdane then divided the mass of the Northumbrian territory among his followers, who, settling among the Anglo-Saxons there, and, intermarrying with them, became, in the course of a few generations, so mixed as to form almost one people. It is not easy, from the vagueness of the old writers, to fix limits; but this fusion was probably felt strongest along our north-eastern coast between the Tees and the Tweed, where some Danish peculiarities are still detected among the people. While Halfdane was pursuing these measures in the north, a still stronger army, commanded by three kings, marched upon Cambridge, which they fortified and made their winter-quarters. By this time the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, were entirely obliterated, and the contest lay between the Danes and Alfred's men of Wessex.

At the opening of the year 876, the host that had wintered in Cambridge took to their ships, and, resolving to carry the war they had renewed into the heart of Wessex, they landed on the coast of Dorsetshire, surprised the castle of Wareham, and scoured the neighbouring country. But in the interval of the truce, Alfred's mind had conceived an idea which may be looked upon as the embryo of the naval glory of England. After their establishment in our island, the Saxons, who, at their first coming, were as nautical a people as the Danes, imprudently neglected sea affairs; but, in his present straits, Alfred saw the advantages to be derived from the employment of ships along the coast, where they might either prevent the landing of an enemy, or cut off their supplies and reinforcements, which generally came by sea, and as frequently from the continent as elsewhere. The first flotilla he set afloat was small and almost contemptible; but in its very first encounter with the enemy, it proved victorious, attacking a Danish squadron of seven ships, one of which was taken, the rest put to flight. This happened immediately after the surprise of Wareham; and when, in a few days, the Danes agreed to treat for peace, and evacuate the territory of Wessex, the consequences of the victory were magnified in the eyes of the people. In concluding this peace, after the Danish chiefs or kings had sworn by their golden bracelets—a most solemn form of oath with them—Alfred, who was not above all the superstitions of his age, insisted that they should swear upon the relics of some Christian saints.* The Danes swore by both, and the very next night fell upon Alfred as he was riding with a small force, and suspecting no mischief, towards the town of Winchester. The king had a narrow escape; the horsemen who attended him were nearly all dismounted and slain, and, seizing their horses, the Danes galloped off in the direction of Exeter, whither, as they were no doubt informed, another body of their brethren were proceeding, having come round by sea, and landed at the mouth of the Exe. Their plan now was to take Alfred in the rear of his strong-hold in the west of England, and to rouse again the people of Cornwall against the Saxons. A formidable Danish fleet sailed from the mouth of the Thames to reinforce the troops united in Devonshire; but Alfred's infant navy, strengthened by some new vessels, stood ready to intercept it. A storm which arose, caused the wreck of half the Danish ships on the Hampshire coast; and when the others arrived tardily and in a shattered condition, they were met by the Saxon fleet that blockaded the Exe, and entirely destroyed, after a gallant action. Before this, his second sea victory, Alfred had come up with his land forces, and invested Exeter; and King Guthrun, the Dane, who held that town, on learning the destruction of his fleet, capitulated, gave hostages and oaths, and marched with his northmen from Exeter and the kingdom of Wessex into Mercia.

Alfred had now felt the value of the fleet he had created, and which, weak as it was, maintained his cause on the sea during the retreat to which he was now about to be condemned. The crews of these

* Asser, 28.

ships, however, must have been oddly constituted; for, not finding English mariners enough, he engaged a number of Friesland pirates or rovers to serve him. These men did their duty gallantly and faithfully. It is curious to reflect, that they came from the same country which ages before had sent forth many of the Angles to the conquest of Britain; and they may have felt even at that distance of time a strong sympathy with the Anglo-Saxon adherents of Alfred. The reader has already weighed the value of a Danish treaty of peace. Guthrun had no sooner retreated from Exeter, than he began to prepare for another war; and this he did with great art, and by employing all his means and influence; for he had learned to appreciate the qualities of his enemy, and he was himself the most skilful, steady, and persevering of all the invaders. He fixed his head-quarters at no greater distance from Alfred than the city of Gloucester, around which he had broad and fertile lands to distribute among his warriors. His fortunate raven attracted the birds of rapine from every quarter; and when everything was ready for a fresh incursion into the west, he craftily proceeded in a new and unexpected manner. A winter campaign had hitherto been unknown among the Danes, but on the first day of January, 878, his choicest warriors received a secret order to meet him on horseback, at an appointed place. Alfred was at Chippenham, a strong residence of the Wessex kings. It was the feast of the Epiphany, or Twelfth-night, and the Saxons were probably celebrating the festival, when they heard Guthrun and his Danes were at the gates. Surprised thus, by the celerity of an overwhelming force, they could offer but an ineffectual resistance. Many were slain; the foe burst into Chippenham, and Alfred escaping with a little band, retired, with an anxious mind, to the woods and the fastnesses of the Moors. As the story is generally told, the king could not make head against the Danes; but other accounts state that he immediately fought several battles in rapid succession. We are inclined to the latter belief, which renders the broken spirits and despair of the men of Wessex more intelligible; but all are agreed in the facts that, not long after the Danes stole into Chippenham, they rode over the kingdom of Wessex, where no army was left to oppose them; that numbers of the population fled to the Isle of Wight and the opposite shores of the continent, while those who remained tilled the soil for their hard taskmasters, the Danes, whom they tried to conciliate with presents and an abject submission. The brave men of Somerset alone retained some spirit, and continued, in the main, true to their king; but even in their country, where he finally sought a refuge, he was obliged to hide in fens and coverts, for fear of being betrayed to his powerful foe Guthrun. Near the confluence of the rivers Thone and Parret, there is a tract of country still called Athelney, or the Prince's Island. The waters of the little rivers now flow by corn-fields, pasture-land, a farm-house, and a cottage; but in the time of Alfred, the whole tract was covered by a dense wood, the secluded haunt of deer, wild boars, wild goats, and other beasts of the forest. It has now long ceased to be an island; but in those days, when not washed by the two rivers, it was insulated by bogs and inundations, which could only be passed in a boat. In this secure lurking-place the king abode some time, making himself a small hold or fortress there. For sustenance, he and his few followers depended upon hunting and fishing, and the spoil they could make by sudden and secret forays among the Danes. From an ambiguous expression of some of the old writers, we might believe he sometimes plundered his own subjects; and this is not altogether improbable, if we consider his pressing wants and the necessity under which he lay, of concealing who he was. This secret seems to have been most scrupulously kept by his few adherents, and to have been maintained, on his own part, with infinite patience and forbearance. A well-known story, endeared to us all by our earliest recollections, is told by his cotemporary and bosom friend, the monk Asser; it is repeated by all the writers who lived near the time, and may safely be considered as authentic as it is interesting. In one of his excursions he took refuge in the humble cabin of a swineherd, where he stayed some time. On a certain day, it happened that the wife of the swain prepared to bake her *loudas*, or loaves of bread. The king, sitting at the time near the hearth, was making ready his bow and arrows, when the shrew beheld her loaves burning. She ran hastily and removed them, scolding the king for his shameful negligence, and exclaiming, "You man! you will not turn the bread you see burning, but you will be glad enough to eat it." "This unlucky woman," adds Asser, "little thought she was talking to the King Alfred."

From his all but inaccessible retreat in Athelney, the king maintained a correspondence with some of his faithful adherents. By degrees, a few bold warriors gathered round him in that islet, which they more strongly fortified, as a point upon which to retreat in case of reverse; and between the Easter and Whitsuntide following his flight, Alfred saw hopes of his emerging from obscurity. According to some of the superstitious old chroniclers, these hopes were first raised by a supernatural intervention. We have passed in silence over the miracles and marvels that swarm in all these ages, but the following is a good trait of the times, and a touching picture of Alfred's destitution and benevolence. The incident is thus related by an old writer: "Upon a time, when his company had departed from him in search of victuals to eat, and he for pastime was reading on a book, a poor pilgrim came to him, and asked his alms, in God's name. The king lifted up his hands to heaven, and said, 'I thank God of his grace that he visiteth his poor man this day by another poor man, and vouchsafeth to ask of me that which he hath given me.' Then the king anon called his servant, that had

but one loaf and a very little wine, and bade him give the half thereof unto the poor man, who received it thankfully, and suddenly vanished from his sight, so that no step of him was seen on the fen or moor he passed over; and also what was given to him by the king, was left there even as it had been given unto him. Shortly after, the company returned to their master, and brought with them great plenty of fish that they had then taken. The night following, when the king was at his rest, there appeared to him one in a bishop's wede, and charged him that he should love God, and keep justice, and be merciful to the poor men, and reverence priests; and said, moreover, 'Alfred! Christ knoweth thy will and conscience, and now will make an end of thy sorrow and care; for tomorrow strong helpers shall come to thee, by whose help thou shalt subdue thine enemies.' 'Who art thou?' said the king. 'I am St. Cuthbert,' said he; 'the poor pilgrim that yesterday was here with thee, to whom thou gavest both bread and wine. I am busy for thee and thine; wherefore have thou mind hereof when it is well with thee.' Then Alfred, after this vision, was well comforted, and showed himself more at large."

To descend to more sober history. The men of

ALFRED AND THE PILGRIM.—B. West.

Somersetshire, Wiltshire, Dorsetshire, and Hampshire began to flock in; and, with a resolute force, Alfred was soon enabled to extend his operations against the Danes. In the interval, an important event in Devonshire had favoured his cause. Hubba, a Danish king or chief of great renown, in attempting to land there, was slain, with eight or nine hundred of his followers; and their magical banner, a raven, which had been embroidered in one noon-tide by the hands of the three daughters of the great Lodbroke fell, into the hands of the Saxons. Soon after, receiving the welcome news at Athelney, the king determined to convert his skirmishes and loose partisan warfare into more decisive operations. Previously to this, however, he was anxious to know the precise force and condition of the army which Guthrun kept together; and, to obtain this information, he put himself in great jeopardy, trusting to his own resources and address. He assumed the habit of a wandering minstrel, or gleeman, and with his instruments of music in his hands, gained a ready entrance into the camp and the tents and pavilions of the Danes. As he amused these idle warriors with songs and interludes, he espied all their sloth and negligence, heard much of their councils and plans, and was soon enabled to return to his friends at Athelney with a full and satisfactory account of the state and habits of that army. Then secret messengers were sent to all quarters, requesting the trusty men of Wessex to

meet in arms at Egbert's stone, on the east of Selwood Forest.* The summons was obeyed, though most knew not the king had sent it; and when Alfred appeared at the place of rendezvous, he was received with enthusiastic joy—the men of Hampshire, and Dorset, and Wilts rejoicing as if he had been risen from death to life. In the general battle of Ethandune which ensued (seven weeks after Easter), the Danes were taken by surprise, and thoroughly beaten. Alfred's concealment, counting from his flight from Chippenham, did not last above five months.

It is reasonably supposed that the present Yatton, about five miles from Chippenham, is the representative of Ethandune, or Assandune; but that the battle was fought a little lower on the Avon, at a place called "Slaughter-ford," where, according to a tradition of the country people, the Danes suffered a great slaughter. Guthrun retreated with the mournful residue of his army to a fortified position. Alfred followed him thither, cut off all his communications, and established a close blockade. In fourteen days, famine obliged the Danes to accept the conditions offered by the Saxons. These conditions were liberal; for, though victorious, Alfred could not hope to drive the Danes by one, nay, nor by twenty battles, out of England. They were too numerous, and had secured themselves in too considerable a part of the island. The first points insisted upon in the treaty were, that Guthrun should evacuate all Wessex, and submit to be baptized. Without a conversion to Christianity, Alfred thought it impossible to rely on the promises or oaths of the Danes; he saw that a change of religion would, more than anything else, detach them from their savage Scandinavian brethren across the seas; and as he was a devout man, with priests and monks for his counsellors, religion, no doubt, was as precious to him as policy, and he was moved with an ardent hope of propagating and extending the Christian faith. Upon Guthrun's ready acceptance of these two conditions, an extensive cession of territory was made to him and the Danes; and here the great mind of Alfred probably contemplated the gradual fusion of two people—the Saxons and the Danes—who differed in but few essentials, and foresaw that the pursuits of agriculture and industry, growing up among them, after a tranquil settlement, would win the rovers of the north from their old plundering, piratical habits. As soon as this took place, they would guard the coasts they formerly desolated. If it had even been in Alfred's power to expel them all (which it never was), he could have had no security against their prompt return and incessant attacks. There was territory enough, fertile though neglected, to give away, without straitening the Saxons. In the most happy time of the Roman occupation, a great part of Britain was but thinly inhabited; and the famines, the pestilences, the almost incessant wars which had followed since then, had depopulated whole counties, and left immense tracts of land without hands to till them, or mouths to eat the produce they promised the agriculturist.

Alfred thus drew the line of demarkation between him and the Danes:—"Let the bounds of our dominion stretch to the river Thames, and from thence to the water of Lea, even unto the head of the same water; and thence straight unto Bedford, and finally, going along by the river Ouse, let them end at Watling-street." Beyond these lines, all the east side of the island, as far as the Humber, was surrendered to the Danes; and as they had established themselves in Northumbria, that territory was soon united, and the whole eastern country from the Tweed to the Thames, where it washes a part of Essex, took the name of the *Danelagh*, or "Dane-law," which it retained for many ages, even down to the time of the Norman conquest. The cession was large; but it should be remembered that Alfred, at the opening of his reign, was driven into the western corner of England, and that he now gained tranquil possession of five, or perhaps ten times more territory than he then possessed.* In many respects, these his moderate measures answered the end he proposed. Soon after the conclusion of the treaty, Guthrun, relying on the good faith of the Saxons, went with only thirty of his chiefs to Aulre, near Athelney. His old but gallant and generous enemy, Alfred, answered for him at the baptismal font, and the Dane was christened under the Saxon name of Athelstan. The next week the ceremony was completed with great solemnity at the royal town of Wedmor, and after spending twelve days as the guest of Alfred, Guthrun departed (A.D. 878), loaded with presents, which the monk Asser says were *magnificent*. Whatever were his inward convictions, or the efficacy and sincerity of his conversion, the Danish prince was certainly captivated by the merits of his victor, and ever afterwards continued the faithful friend and ally (if not vassal) of Alfred. The subjects under his rule in the Danelagh, or "Dane-law," assumed habits of industry and tranquillity, and gradually adopted the manners and customs of more civilized life. By mutual agreement, the laws of the Danes were assimilated to those of the Saxons; but the former long retained many of their old Scandinavian usages. In the jurisprudence of those days, the life of an Englishman was estimated according to his rank, at so many shillings or pieces of coined money; and now it was agreed that the lives of the Danes should be considered of equal value with the lives of the Anglo-Saxons. In other words, the same money was to be paid in fine by him who killed a Dane, as by him who slew an Englishman, supposing always the rank of the slain to be equal. The fines payable for all offences were determined

* Asser, 33. The wood extended from Frome to Burham, and was probably much larger at one time.

* Mercia fell completely into the power of Alfred, after the defeat of Guthrun. He abolished the regal honours of that state, and intrusted the military command of it to Ethelred, who was afterwards married to one of his daughters. Ethelred seems to have been merely styled the "Eolderman of Mercia."

both in Danish and Saxon monies, to prevent disputes arising from their difference of currency. A wise regulation, considering the recent hostilities and implacable hatred that had existed between those forces, forbade all secret intercourse between the soldiery of the Saxon and Danish armies. All sales, whether of *men*, horses, or oxen, were declared illegal, unless the purchaser produced the voucher of the seller. This was to put a stop on both sides to the lifting of cattle, and the carrying off of the peasantry as slaves. Both kings engaged to promote the Christian religion, and to punish apostasy. We are not well informed as to the progress the faith made among his subjects on Guthrun's conversion; but it was probably rapid, though imperfect, and accompanied with a lingering affection for the divinities of the Scandinavian mythology.

ALFRED'S "JEWEL,"

An ornament of gold, apparently intended to hang round the neck, found in Athelney, and now in the Ashmolean Museum, Oxford. The inscription on the side here represented, around the female figure holding flowers, is "Aelfred me haet gewercan" (Alfred had me wrought). On the other side is a flower. The workmanship is in a good style.

It was about this time, or very soon after Alfred's breaking up from his retreat at Athelney, and gaining the victory of Ethandune, that, moved by the love of humane letters which distinguished him all his life, he invited Asser, esteemed the most learned man then in the island, to his court or camp, in order that he might profit by his instructive conversation. The monk of St. David's, who was not a Saxon, but descended from a Welsh family, obeyed the summons, and, according to his own account, he was introduced to the king at Dene, in Wiltshire, by the thanes who had been sent to fetch him. A familiar intercourse followed a most courteous reception, and then the king invited the monk to live constantly about his person. The vows of Asser and his attachment to his monastery, where he had been nurtured and instructed, interfered with this arrangement; but, after some delays, it was agreed he should pass half his time in his monastery, and the rest of the year at court. Returning at length to Alfred, he found him at a place called Leonaford. He remained eight months constantly with him, conversing and reading with him all such books as the king possessed. On the Christmas eve following, Alfred, in token of his high regard, gave the monk an abbey in Wiltshire, supposed to be at Amesbury, and another abbey at Banwell, in Somersetshire, together with a rich silk pall, and as much incense as a strong man could carry on his shoulders, assuring him at the same time that he considered these as small things for a man of so much merit, and that hereafter he should have greater. Asser was subsequently promoted to the bishopric of Sherburn, and thenceforward remained constantly with the king, enjoying his entire confidence and affection, and sharing in all his joys and sorrows. This rare friendship between a sovereign and subject continued unbroken till death; and when the grave closed over the great Alfred, the honourable testimony was read in his will, that Asser was a person in whom he had full confidence. To this singular connexion Alfred and his subjects were, no doubt, indebted for some improvements in the royal mind, which wrought good alike for the king and for the people; and *we*, at the distance of nearly a thousand years, owe to it an endearing record of that monarch's personal character and habits. Asser was a sort of Boswell of the dark ages; and the hero whose private as well as public life he delineated, well deserved so attentive a chronicler.

But some time had yet to pass ere Alfred could give himself up to quiet enjoyments, to law-making, and the intellectual improvement of his people. Though Guthrun kept his contract, hosts of marauding Danes, who were not bound by it, continued to cross over from the continent, and infest the shores and rivers of our island. In 879, the very year after Guthrun's treaty and baptism, a great army of Pagans came from beyond the sea, and wintered at Fullanham, or Fulham, hard by the river Thames. From Fulham, this host proceeded to Ghent, in the Low Countries. At this period the Northmen alternated their attacks on England, and their attacks on Holland, Belgium, and East France, in a curious manner, the expedition beginning on one side of the British channel and German Ocean frequently ending on the other side. The rule of their conduct, however, seems to have been this—to persevere only against the weakest enemy. Thus, when they found France strong, they tried England; and when they found the force of England consolidated under Alfred, they turned off in the direction of France, or the neighbouring shores of the continent. It is a melancholy fact, that England then benefited by the calamities of her neighbours. In the year 886,

while the armies of the Northmen were fully employed in besieging or blockading the city of Paris, Alfred took that favourable opportunity to rebuild and fortify the city of London. Amongst other cities, we are told, it had been destroyed by fire, and the people killed; but he made it habitable again, and committed it to the care and custody of his son-in-law, Ethelred, earl or eolderman of the Mercians, to whom before he had given his daughter Ethelfleda. Each of the six years immediately preceding the rebuilding of London, he was engaged in hostilities; but he was generally fortunate by sea as well as by land, for he had increased his navy, and the care due to that truly national service. In the year 882 his fleet, still officered by Frieslanders, took four, and, three years after (in one fight), sixteen of the enemy's ships. In the latter year (885) he gained a decisive victory over a Danish host that had ascended the Medway, and were besieging Rochester, having built them a strong castle before the gates of that city. By suddenly falling on them, he took their tower with little loss, seized all the horses they had brought with them from France, recovered the greater part of their captives, and drove them with the sword in their reins to their ships, with which they returned to France in the utmost distress.

Alfred was now allowed some breathing time, which he wisely employed in strengthening his kingdom, and bettering the condition of his people. Instead, however, of tracing these things strictly in their chronological order, it will add to the perspicuity of the narrative, if we follow at once the warlike events of his reign to their close.

The siege of Paris, to which we have alluded, and which began in 886, employed the Danes or Northmen two whole years. Shortly after the heathens burst into the country now called Flanders, which was then a dependency of the Frankish or French kings, and were employed there for some time in a difficult and extensive warfare. A horrid famine ensued in those parts of the continent, and made the hungry wolves look elsewhere for sustenance and prey. England now revived by a happy repose of seven years; her corn fields had borne their plentiful crops; her pastures, no longer swept by the tempests of war, were well sprinkled with flocks and herds; and those good fatted beeves, which were always dear to the capacious stomachs of the Northmen, made the island a very land of promise to the imagination of the famished. It is true that of late years they had found those treasures were well defended, and that nothing was to be got under Alfred's present government without hard blows, and a desperate contest, at least doubtful in its issue; but hunger impelled them forward; they were a larger body than had ever made the attack at once; they were united under the command of a chief equal or superior in fame and military talent to any that had preceded him; and therefore the Danes, in the year 893, once more turned the prows of their vessels towards England. It was indeed a formidable fleet. As the men of Kent gazed seaward from their cliffs and downs they saw the horizon darkened by it;—as the winds and waves wafted it forward they counted two hundred and fifty several ships; and every ship was full of warriors, and horses brought from Flanders and France for the immediate mounting of them as a rapid, predatory cavalry. The invaders landed near Romney marsh, at the eastern termination of the great wood or weald of Anderida (already mentioned in connexion with an invasion of the Saxons), and at the mouth of a river, now dry, called Limine. They towed their ships four miles up the river towards the weald, and there mastered a fortress the peasants of the country were raising in the fens. They then proceeded to Apuldre or Appledore, at which point they made a strongly fortified camp, whence they ravaged the adjacent country for many miles. Nearly simultaneously with these movements, the famed Haesten, or Hasting, the skilful commander-in-chief of the entire expedition, entered the Thames with another division of eighty ships, landed at and took Milton, near Sittingbourn, and there threw up prodigiously strong entrenchments. Their past reverses had made them extremely cautious, and for nearly a whole year the Danes in either camp did little else than fortify their positions and scour the country in foraging parties. Other piratical squadrons, however, kept hovering round our coasts to distract attention and create alarm at many points at one and the same time. The honourable and trustworthy Guthrun had now been dead three years; and to complete the most critical position of Alfred, the Danes settled in the Danelagh, even from the Tweed to the Thames, violated their oaths, took up arms against him, and joined their marauding brethren under Hasting. It was in this campaign, or rather this succession of campaigns, which lasted altogether three years, that the military genius of the Anglo-Saxon monarch shone with its greatest lustre, and was brought into full play by the ability, the wonderful and eccentric rapidity, and the great resources of his opponent Hasting. To follow their operations the reader must place the map of England before him, for they ran over half of the island, and shifted the scene of war with almost as much rapidity as that with which the decorations of a theatre are changed.

The first great difficulty Alfred had to encounter was in collecting and bringing up sufficient forces to one point, and then in keeping them in adequate number in the field; for the Saxon "fyrd," or *levée en masse*, were only bound by law to serve for a certain time (probably forty days), and it was indispensable to provide for the safety of the towns, almost everywhere threatened, and to leave men sufficient for the cultivation of the country. Alfred overcame this difficulty by dividing his army, or militia, into two bodies; of these he called one to the field, while the men composing the other were left at home. After a reasonable length of service those in the field returned to their homes, and those

left at home took their places in the field. The spectacle of this large and permanent army, to which they had been wholly unaccustomed, struck Hasting and his confederates with astonishment and dismay. Nor did the position the English king took up with it give them much ground for comfort. Advancing into Kent, he threw himself between Hasting and the other division of the Danes: a forest on one side, and swamps and deep waters on the other, protected his flanks, and he made the front and rear of his position so strong that the Danes dared not look at them. He thus kept asunder the two armies of the Northmen, watching the motions of both, being always ready to attack either, should it quit its entrenchments; and so active were the patrols and troops he threw out in small bodies, and so good the spirit of the villagers and town-folk, cheered by the presence and wise dispositions of the sovereign, that in a short time not a single foraging party could issue from the Danish camp without almost certain destruction. Worn out in body and spirit, the Northmen resolved to break up from their camps, and, to deceive the king as to their intentions, they sent submissive messages and hostages, and promised to leave the kingdom. Hasting took to his shipping, and actually made sail, as if to leave the well-defended island; but while the eyes of the Saxons were fixed on his departure, the other division, in Alfred's rear, rushed suddenly from their entrenchments into the interior of the country, in order to seek a ford across the Thames by which they hoped to be enabled to get into Essex, where the rebel Danes that had been ruled by Guthrun would give them a friendly reception, and where they knew they should meet Hasting and his division, who, instead of putting to sea, merely crossed the Thames, and took up a strong position at Benfleet, on the Essex coast. Alfred had not ships to pursue those who moved by water; but those who marched by land he followed up closely, and brought them to action on the right bank of the Thames, near Farnham in Surrey. The Danes were thoroughly defeated. Those who escaped the sword and drowning marched along the left bank of the Thames through Middlesex into Essex; but being hotly pursued by Alfred, they were driven right through Essex and across the river Colu, when they found a strong place of refuge in the isle of Mersey. Here, however, they were closely blockaded, and soon obliged to sue for peace, promising hostages, as usual, and an immediate departure from England. Alfred would have had this enemy in his hand through sheer starvation, but the genius of Hasting and the defection of the Northmen of the Danelagh called him to a distant part of the island. Two fleets, one of a hundred sail, the second of forty, and both in good part manned by the Danes who had been so long, and for the last fifteen years so peacefully, settled in England, set sail to attack in two points and make a formidable diversion. The first of these, which had probably been equipped in Norfolk and Suffolk, doubled the North Foreland, ran down the southern coast as far as Devonshire, and laid siege to Exeter: the smaller fleet, which had been fitted out in Northumbria, and probably sailed from the mouth of the Tyne, took the passage round Scotland and the extreme north of the island, ran down all the western coast from Cape Wrath to the Bristol Channel, and, ascending that arm of the sea, beleaguered a fortified town to the north of the Severn. Though Alfred had established friendly relations with the people of the west of England, who seem on many occasions to have served him with as much ardour as his Saxon subjects, he still felt Devonshire was a vulnerable part. Leaving, therefore, a part of his army on the confines of Essex, he mounted all the rest on horses, and flew to Exeter. Victory followed him to the west; he obliged the Danes to raise the siege of Exeter; he beat them back to their ships with great loss, and soon after the minor expedition was driven from the Severn. The blockade of the Danes in the isle of Mersey does not appear to have been well conducted during his absence, and yet that interval was not devoid of great successes: for, in the mean time, Ethelred, eolderman of the Mercians and Alfred's son-in-law, with the citizens of London and others, went down to the fortified post at Benfleet, in Essex, laid siege to it, broke into it, and despoiled it of great quantities of gold, silver, horses, and garments; taking away captive also the wife of Hasting and his two sons, who were brought to London and presented to the king on his return. Some of his followers urged him to put these captives to death,—others to detain them in prison as a check upon Hasting; but Alfred, with a generosity which was never properly appreciated by the savage Dane, caused them immediately to be restored to his enemy, and sent many presents of value with them. By this time the untiring Hasting had thrown up another formidable entrenchment at South Showbury, in Essex, when he was soon joined by numbers from Norfolk and Suffolk, from Northumbria, from all parts of the Danelagh, and by fresh adventurers from beyond sea. Thus reinforced, he sailed boldly up the Thames, and thence spread the mass of his forces into the heart of the kingdom, while the rest returned with their vessels and the spoil they had so far made to the entrenched camp at South Showbury. From the Thames Hasting marched to the Severn, and fortified himself at Buttington. But here he was surrounded by the Saxons and the men of North Wales, who now cordially acted with them; and in brief time Alfred, with Ethelred and two other eoldermen, cut off all his supplies, and blockaded him in his camp. After some weeks, when the Danes had eaten up nearly all their horses, and famine was staring them in the face, Hasting rushed from his entrenchments. Avoiding the Welsh forces, he concentrated his attack upon the Saxons, who formed the blockade to the east of his position. The conflict was terrific; some hundreds (some of the chroniclers say

thousands) of the Danes were slain in their attempt to break through Alfred's lines; many were thrown into the Severn, and drowned; but the rest, headed by Hasting, effected their escape, and, marching across the island, reached their entrenchment and their ships on the Essex coast. Alfred lost many of his nobles, and must have been otherwise much crippled, for he did not molest Hasting, who could have had hardly any horse in any part of his retreat. Most of the Saxons who fought at Buttington were raw levies, and hastily got together. When Hasting next showed front it was in the neighbourhood of North Wales, between the rivers Dee and Mersey. During the winter that followed his disasters on the Severn he had been again reinforced by the men of the Danelagh, and at early spring he set forth with his usual rapidity, and marched through the midland counties. Alfred was not far behind him, but could not overtake him until he had seized Chester, which was then almost uninhabited, and secured himself there. This town had been very strongly fortified by the Romans, and many of the works of those conquerors, still remaining,* no doubt gave strength to Hasting's position, which was deemed too formidable for attack. But the Saxon troops pressed him on the land side, and a squadron of Alfred's ships, which had put to sea, ascended the Mersey and the river Wirall, and prevented his receiving succour in that direction. Dreading that Chester might become a second Buttington, the Danes burst away into North Wales. After ravaging part of that country, they would have gone off in the direction of the Severn and the Avon, but they were met and turned by a formidable royal army, upon which they retraced their steps, and finally marched off to the north-east. They traversed Northumbria, Lincolnshire, Norfolk, Suffolk,—nearly the whole length of the Danelagh, where they were among friends and allies, and by that circuitous route at length regained their fortified post at South Showbury, in Essex, where they wintered and recruited their strength as usual.

Earlier next spring the persevering Hasting sailed to the mouth of the Lea, ascended that river with his ships, and at or near Ware,† about twenty miles above London, erected a new fortress on the Lea. On the approach of summer the burgesses of London, with many of their neighbours, who were sorely harassed by this move of the Danes, attacked the stronghold on the Lea, but were repulsed with great loss. As London was now more closely pressed than ever, Alfred found it necessary to encamp his army round about the city until the citizens got in their harvest. He then pushed a strong reconnoissance to the Lea, which (far deeper and broader than now) was covered by their ships, and afterwards surveyed, at great personal risk, the new fortified camp of the Danes. His active ingenious mind forthwith conceived a plan which he confidently hoped would end in their inevitable destruction. Bringing up his forces, he raised two fortresses, one on either side the Lea, somewhat below the Danish station, and then dug three deep channels from the Lea to the Thames, in order to lower the level of the tributary stream. So much water was thus drawn off, that "where a ship," says an old writer, "might sail in time afore passed, then a little boat might scarcely row,"—and the whole fleet of Hasting was left aground, and rendered useless. But yet again did that remarkable chieftain break through the toils spread for him, to renew the war in a distant part of the island. Abandoning the ships where they were, and putting, as they had been accustomed to do, their wives, their children, and their booty under the protection of their friends in the Danelagh, the followers of Hasting broke from their entrenchments by night, and hardly rested till they had traversed the whole of that wide tract of country which separates the Lea from the Severn. Marching for some distance along the left bank of the Severn, they took post close on the river at Quatbridge, which is supposed to be Quatford, near Bridgenorth, in Shropshire. When Alfred came up with them there, he found them already strongly fortified.

On our first introducing the Northmen we mentioned their skill in choosing and strengthening military positions, and the course of our narrative will have made their skill and speed in these matters evident, especially in the campaigns they performed under Hasting, who had many of the qualities that constitute a great general. Alfred was compelled to respect the entrenchments at Quatbridge, and to leave the Danes there undisturbed during the winter. In the mean time the citizens of London seized Hasting's fleet, grounded in the Lea. Some ships they burned and destroyed, but others they were enabled to get afloat and conduct to London, where they were received with exceeding great joy.

For full three years this Scandinavian Hannibal had maintained a war in the country of the enemy; but now watched on every side, worn out by constant losses, and probably in good part forsaken, as an unlucky leader, both by his brethren settled in the Danelagh and by those on the continent, his spirit began to break, and he prepared to take a reluctant and indignant farewell of England. In the following spring of 897, by which time dissensions had broken out among their leaders, the Danes tumultuously abandoned their camp at Quatbridge, and utterly disbanded their army soon after, flying in small and separate parties, in various directions. Some sought shelter among their brethren of the Danelagh, either in Northumbria, or Norfolk and Suffolk; some built vessels, and sailed for the Scheldt and the mouth of the Rhine; while others, adhering to Hasting in his evil fortune, waited until he was ready to pass into France. A small fleet, bearing his drooping raven,

* Some noble arched gateways built by the Romans were standing almost entire until a recent period, when they were laid low by a barbarous decree of the Chester corporation.

† Some topographers contend that this fortified camp was not at Ware, but at Hertford.

was hastily equipped on our eastern coast, and the humbled chieftain, according to Asser, crossed the Channel, "*sine lucro et sine honore*,"—without profit or honour. It appears that he ascended the Seine, and soon after obtained a settlement on the banks of that river (probably in Normandy) from the weak king of the French.

A few desultory attacks made by sea, and by the men of the Danelagh, almost immediately after Hasting's departure, only tended to show the naval superiority Alfred was attaining, and to improve the Anglo-Saxons in maritime tactics. A squadron of Northumbrian pirates cruised off the southern coasts with their old objects in view. It was met and defeated on several occasions by the improved ships of the king. Alfred, who had some mechanical skill himself, had caused vessels to be built far exceeding those of his enemies in length of keel, height of board, swiftness and steadiness: some of these carried sixty oars, or sweepers, to be used, as in the Roman galleys, when the wind failed; and others carried even more than sixty. They differed in the form of the hulk, and probably in their rigging, from the other vessels used in the North Sea. Hitherto the Danish and Friesland builds seem to have been considered as the best models; but these ships, which were found peculiarly well adapted to the service for which he intended them, were constructed after a plan of Alfred's own invention. At the end of his reign they considerably exceeded the number of one hundred sail: they were divided into squadrons, and stationed at different ports round the island, while some of them were kept constantly cruising between England and the main. Although he abandoned their system of ship-building, Alfred retained many Frieslanders in his service; for they were more expert seamen than his subjects, who still required instruction. After an obstinate engagement near the Isle of Wight, two Danish ships, which had been much injured in the fight, were cast ashore and taken. When the crews were carried to the king, at Winchester, he ordered them all to be hanged. This severity, so much at variance with Alfred's usual humanity, has caused some regret and confusion to historians. One writer says that the Danes do not seem to have violated *the law of nations*, as such law was then understood, and that, therefore, Alfred's execution of them was inexcusable. Another writer is of opinion that Alfred always, and properly, drew a distinction between pirates and warriors. This line would be most difficult to draw when all were robbers and pirates alike; but the real rule of Alfred's conduct seems to have been this—to distinguish between such Danes as attacked him from abroad, and such Danes as attacked him from the Danelagh at home. On the services and gratitude of the former he had no claim; but the men of Northumbria, Norfolk, and Sussex, had, through their chiefs and princes, sworn allegiance to him, had received benefits from him, and stood bound to the protection of his states, which they were ravaging. From the situation they occupied they could constantly trouble his tranquillity; and in regard to them he may have been led to consider, after the experience he had had of their bad faith, that measures of extreme severity were allowable and indispensable. The two ships captured at the Isle of Wight came from Northumbria; and the twenty ships taken during the three remaining years of his life, and of which the crews were slain or hanged on the gallows, came from the same country, and the other English lands included in the Danelagh.

The excursions of Hasting were accompanied with other calamities; "so that," to use the words of the chronicler Fabian, "this land, for three years, was vexed with three manner of sorrows,—with war of the Danes, pestilence of men, and murrain of beasts." The horrors of famine, to escape which the Danes had come to England, are not alluded to; but the pestilence, which is mentioned by all the chroniclers, carried off vast numbers, and among them many of the chief thanes or nobles of the Saxons. It seems to have continued some time after Hasting's departure, and then, on its cessation, Alfred enjoyed as much comfort as his rapidly declining health would permit.

The intellectual character of this truly great sovereign, his literary productions, his efforts for promoting the education of his people, his improvements in laws and administration, will be noticed in their proper places. But before we descend to the far inferior reigns of his successors, we must select from his biographers a few personal details, and cull a few of those flowers which adorned his reign, and which still give it a beauty and an interest we look for in vain elsewhere during those barbarous ages.

Historians have generally attached great consequences to his travels on the continent through France and Italy, and, mere child as he was, it is not improbable that Alfred's mind received impressions in those countries that were afterwards of benefit to himself and his kingdom. On the first of these journeys to Rome, Alfred was only in his fifth year, but on the second, when he was accompanied by his father, and anointed by the Pope, he was eight years old. On this last occasion he staid nearly a year at Rome and returning thence, through France, he resided some time at Paris. The eternal city, though despoiled by the barbarians, and not yet enriched with the works of modern art, must have retained much of its ancient splendour; the Coliseum, and many other edifices that remain, are known to have been much more perfect in the days of Alfred than they are now: the proud Capitol was comparatively entire; and in various parts of the city, where we now trace little but foundations of walls, and scattered fragments, there then stood lofty and elegant buildings. Alfred, who at home had lived in wooden houses, and been accustomed to see mud-huts with thatched roofs, could hardly fail of being struck with the superior splendour of Rome. The papal court,

though as yet modest and unassuming, was regulated with some taste and great order; while the other court at which he resided (the French) was more splendid than any in Europe, with the exception of Constantinople.

But whatever effect these scenes may have had in enlarging the mind of Alfred, it should appear he had not yet learned to read—an accomplishment, by the way, not then very common even among princes and nobles of a more advanced age. He, however, delighted in listening to the Anglo-Saxon ballads and songs which were constantly recited by the minstrels and glee-men attached to his father's court. From frequent vocal repetition, to which he listened day and night,* he learned them by heart; and the taste he thus acquired for poetry lasted him, through many cares and sorrows, to the last day of his life. The story told by Asser is well known. One day his mother, Osburgha, was sitting, surrounded by her children, with a book of Saxon poetry in her hands. The precious manuscript was gilded or illuminated, and the contents were probably new, and much to the taste of the boys. "I will give it," said she, "to him among you who shall first learn to read it." Alfred, the youngest of them all, ran to a teacher, and studying earnestly, soon learned to read Anglo-Saxon, and won the book. But, with the exception of popular poetry, Anglo-Saxon was the key to only a small portion of the literature or knowledge of the times; and as his curiosity and intellect increased, it became necessary for him to learn Latin. At a subsequent period of his life, Alfred possessed a knowledge of that learned language, which was altogether extraordinary for a prince of the ninth century. It is not very clear when he obtained this degree of knowledge; but after teaching himself by translating, he was probably greatly improved in his mature manhood, when the monk Asser, Johannes Erigena, Grimbald, and other learned men, settled at his court. Alfred was accustomed to say that he regretted the neglected education of his youth, the entire want of proper teachers, and also the difficulties that then barred his progress to intellectual acquirements, much more than all the hardships and sorrows and crosses that befell him afterwards. As one of his great impediments had been the Latin language, which, even with our improved system of tuition, and with all our facilities and advantages, is not mastered without long and difficult study, he earnestly recommended from the throne, in a circular letter, addressed to the bishops, that thenceforward "all good and useful books be translated into the language which we all understand; so that all the youths of England, but more especially those who are of gentle kind, and in easy circumstances, may be grounded in letters—for they cannot profit in any pursuit until they are well able to read English." Alfred's own literary works were chiefly translations from the Latin into Anglo-Saxon, the spoken language of his people. It excites surprise how he could find time for these laudable occupations; but he was steady and persevering, regular in his habits, when not kept in the field by the Danes, and a great economist of his time. Eight hours of each day he gave to sleep, to his meals, and exercise; eight were absorbed by the affairs of government; and eight were devoted to study and devotion. Clocks, clepsydras, and the other ingenious instruments for measuring time were then unknown in England. Alfred was, no doubt, acquainted with the sun-dial, which was in common use in Italy and parts of France; but this index is of no use in the hours of the night, and would frequently be equally unserviceable during our foggy sunless days. He, therefore, marked his time by the constant burning of wax torches or candles, which were made precisely of the same weight and size, and notched in the stem at regular distances. These candles were twelve inches long; six of them, or seventy-two inches of wax, were consumed in twenty-four hours, or 1440 minutes; and thus, supposing the notches at intervals of an inch, one inch would mark the lapse of twenty minutes. It appears that these time-candles were placed under the special charge of his mass-priests, or chaplains. But it was soon discovered, that sometimes the wind, rushing in through the windows and doors, *and the numerous chinks in the walls of the palace*, consumed the wax in a rapid and irregular manner. Hence Asser makes the great Alfred the inventor of horn-lanterns! He says the king went skilfully and wisely to work; and having found out that white horn could be rendered transparent, like glass, he, with that material and with pieces of wood, admirably (*mirabiliter*) made a case for his candle, which kept it from wasting and flaring.

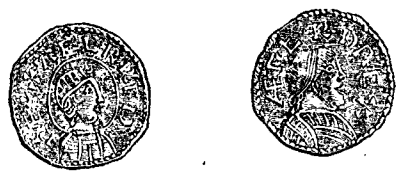
In his youth Alfred was passionately fond of field sports, and was famed as being "excellent cunning in all hunting;" but after his retreat at Athelney he indulged this taste with becoming moderation; and during the latter years of his reign he seems to have ridden merely upon business, or for the sake of his health. He then considered every moment of value, as he could devote it to lofty and improving purposes.

We have already mentioned the care and ingenuity he employed in creating a navy. Sea affairs, geography, and the discovery of unknown countries, or rather the descriptions of countries then little known, obtained by means of bold navigators, occupied much of his time, and formed one of his favourite subjects for writing. He endeavoured, by liberality and kindness, to attract to England all such foreigners as could give good information on these subjects, or were otherwise qualified to illuminate the national ignorance. From Audher, or Ohthere, who had coasted the continent of Europe from the Baltic to the North Cape, he obtained much information; from Wulfstan, who appears to have been one of his subjects, and who undertook a voyage round the Baltic, he gathered many particulars con-

* Asser, 16.

cerning the divers countries situated on that sea; and from other voyagers and travellers whom he sent out expressly himself he obtained a description of Bulgaria, Sclavonia, Bohemia, and Germany. All this information he committed to writing in the plain mother tongue, and with the noble design of imparting it to his people. Having learned that there were colonies of Christian Syrians settled on the coasts of Malabar and Coromandel, he sent out Swithelm, bishop of Sherburn, to India—a tremendous journey in those days. The stout-hearted ecclesiastic, however, making what is now called the overland journey, went and returned in safety, bringing back with him presents of gems and Indian spices. Hereby was Alfred's fame increased, and the name and existence of England probably heard of for the first time in that remote country, of which, nine centuries after, she was to become the almost absolute mistress.

While his active mind, which anticipated the national spirit of much later times, was thus engaged in drawing knowledge from the distant corners of the earth, he did not neglect home affairs. He taught the people how to build better houses; he laboured to increase their comforts; he established schools; he founded or rebuilt many towns; and, having learnt the importance of fortifications during his wars with the Danes, he fortified them all as well as he could. He caused a survey to be made of the coast and navigable rivers, and ordered castles to be erected at those places which were most accessible to the landing of the enemy. Fifty strong towers and castles rose in different parts of the country, but the number would have been threefold had Alfred not been thwarted by the indolence, ignorance, and carelessness of his nobles and people. He revised the laws of the Anglo-Saxons, being aided and sanctioned therein by his witenagemot, or parliament; and he established so excellent a system of police, that towards the end of his reign it was generally asserted that one might have hung golden bracelets and jewels on the public highways and cross-roads, and no man would have dared to touch them for fear of the law. Towards arbitrary, unjust, or corrupt administrators of the law, he was inexorable; and, if we can give credit to an old writer,* he ordered the execution of no fewer than forty-four judges and magistrates of this stamp in the course of one year. Those who were ignorant or careless he reprimanded and suspended, commanding them to qualify themselves for the proper discharge of their office before they ventured to grasp its honours and emoluments. He heard all appeals with the utmost patience, and, in cases of importance, revised all the law proceedings with the utmost industry. His manifold labours in the court, the camp, the field, the hall of justice, the study, must have been prodigious; and our admiration of this wonderful man is increased by the well-established fact, that all these exertions were made in spite of the depressing influences of physical pain and constant bad health. In his early years he was severely afflicted by the disease called the *ficus*. This left him; but, at the age of twenty or twenty-one, it was replaced by another and still more tormenting malady, the inward seat and unknown mysterious nature of which baffled all the medical skill of his "leeches." The accesses of excruciating pain were frequent—at times almost unintermittent; and then, if by day or by night, a single hour of ease was mercifully granted him, that short interval was embittered by the dread of the sure returning anguish.* This malady never left him till the day of his death, which it must have hastened. He expired in the month of October, six nights before All-Hallows-mass-day, in the year 901, when he was only in the fifty-third year of his age, and was buried at Winchester, in a monastery he had founded.



SILVER COINS OF ALFRED.—From Specimens in the British Museum.

In describing his brilliant and incontestable deeds, and in tracing the character of the great Alfred, we, in common with nearly all the writers who have preceded us in the task, have drawn a general eulogy, and a character nearly approaching to ideal perfection. But were there no spots in all this brilliancy and purity? As Alfred was a mortal man, there were, no doubt, many; but to discover them, we must ransack his private life, and his vaguely reported conduct when a mere stripling king; and the discovery, after all, confers no honour of sagacity, and does not justify the exulting yell with which a recent writer announces to the world, that Alfred had not only faults, but crimes to bemoan. It is passed into a truism that he will seldom be in the wrong, who deducts alike from the amount of virtue and vice, in the characters recorded in history; but this deduction will be made according to men's tempers; and while some largely reduce the amount of virtue, they seem to leave the vice untouched—their incredulity extending rather to what elevates and ennobles human nature, than to the things which degrade and debase it. The directly contrary course, or that of reducing the crime, and leaving the virtue, if not the more correct (which we will not decide) is certainly the more generous and improving. Every people above the condition of barbarity have their heroes and their national objects of veneration, and are probably improved by the high standard of excellence they present, and by the very reverence they pay to them. We may venerate the memory

* Andrew Horne, author of "Miroir des Justices," who wrote, in Norman French, under Edward I. or Edward II.

* Asser.

of our Alfred with as little danger of paying an unmerited homage as any of them. On this subject the late Sir James Mackintosh, whose historical sagacity was equal to his good feeling, says, "The Norman historians, who seem to have had his diaries and note-books in their hands, chose Alfred as the glory of the land which had become their own. There is no subject on which unanimous tradition is so nearly sufficient evidence as on the eminence of one man over others of the same condition. His bright image may long be held up before the national mind. This tradition, however paradoxical the assertion may appear, is, in the case of Alfred, rather supported than weakened by the fictions which have sprung from it. Although it be an infirmity of every nation to ascribe their institutions to the contrivance of a man rather than to the slow action of time and circumstances, yet the selection of Alfred by the English people, as the founder of all that was dear to them, is surely the strongest proof of the deep impression left on the minds of all of his transcendant wisdom and virtue."*

Edward. A.D. 901. Alfred, with all his wisdom and power, had not been enabled to settle the succession to the throne on a sure and lasting basis. On his death, it was disputed between his son Edward, and his nephew Ethelwald, the son of Ethelbald, one of Alfred's elder brothers. Each party armed; but as Ethelwald found himself the weaker, he declined a combat at Wimburn, and fled into the Danelagh, where the Danes hailed him as their king. Many of the Saxons who lived in that country mixed with the Danes, preferred war to the restraints of such a government as Alfred had established; and an internal war was renewed, which did infinite mischief, and prepared the way for other horrors. Ethelwald was slain in a terrible battle fought in the year 905, upon which the Danes concluded a peace upon equal terms; for Edward was not yet powerful enough to treat them as a master. The sons of the princes and yarls, and in many instances the individuals themselves, who had been tranquil and submissive under Alfred, soon aimed, not merely at making the Danelagh an independent kingdom, but at conquering the rest of the island. Edward was not deficient in valour or military skill. In the year 911 he gained a most signal victory over the Danes, who had advanced to the Severn; but the whole spirit of Alfred seemed more particularly to survive in his daughter Ethelfleda, sister of Edward, and wife of Ethelred, the colderman of Mercia, who has been so often mentioned, and whose death, in 912, left the whole care of that kingdom to his widow. Her brother Edward took possession of London and Oxford, but she claimed, and then defended the rest of Mercia, with the bravery and ability of an experienced warrior. Following her father's example, she fortified all her towns, and constructed ramparts, and entrenched camps in the proper places: allowing them no rest, she drove the Danes out of Derby and Leicester, and compelled many tribes of them to acknowledge her authority. In the assault of Derby, four of her bravest commanders fell, but she boldly urged the combat until the place was taken. As some of the Welsh had become troublesome, she conducted an expedition with remarkable spirit and rapidity against Breccanmere, or Brecknock, and took the wife of the Welsh king a prisoner. In seeing these her warlike operations, says Ingulf, one would have believed she had changed her sex. The Lady Ethelfleda, as she is called by the chroniclers, died in 920, when Edward succeeded to her authority in Mercia, and prosecuted her plan of securing the country by fortified works. He was active and successful: he took most of the Danish towns between the Thames and the Humber, and forced the rest of the Danelagh that lay north of the Humber to acknowledge his supremacy. The Welsh, the Scots, the inhabitants of Strathclyde and Cumbria (who still figure as a separate people), and the men of Galloway, are said to have done him homage, and to have accepted him as their "father, lord, and protector."

Athelstane. A.D. 925. Edward's dominion far exceeded in extent that of his father Alfred; but his son Athelstane, who succeeded him in 925, established a more brilliant throne, and made a still nearer approach to the sovereignty of all England. By war and policy he reduced nearly all Wales to an inoffensive tranquillity, if not to vassalage. A tribute was certainly paid during a part of the reign, and together with gold and silver, and beeves, the Welsh were bound to send their best hounds and hawks to the court of Athelstane. He next turned his arms against the old tribes of Cornwall, who were still turbulent, and impatient of the Saxon yoke. He drove them from Devonshire, where they had again made encroachments, and reduced them to obedience and good order beyond the Tamar.

In 937 he was assailed by a more powerful confederacy than had ever been formed against a Saxon king. Olave, or Anlaf, a Danish prince, who had already been settled in Northumbria, but who had lately taken Dublin, and made considerable conquests in Ireland, sailed up the Humber with 620 ships; his friend and ally, Constantine, king of the Scots, the people of Strathclyde and Cumbria, and the northern Welsh, were all up in arms and ready to join him. Yet this coalition, formidable as it was, was utterly destroyed on the bloody field of Brunnaburgh,* where Athelstane gained one of the most splendid of victories, and where five Danish *kings* and seven earls fell. Anlaf escaped with a wretched fragment of his forces to Ireland; Constantine, bemoaning the loss of his fair-haired son, who had also perished at Brunnaburgh, fled to the hilly country north of the Friths. After this great victory, none seem to have dared

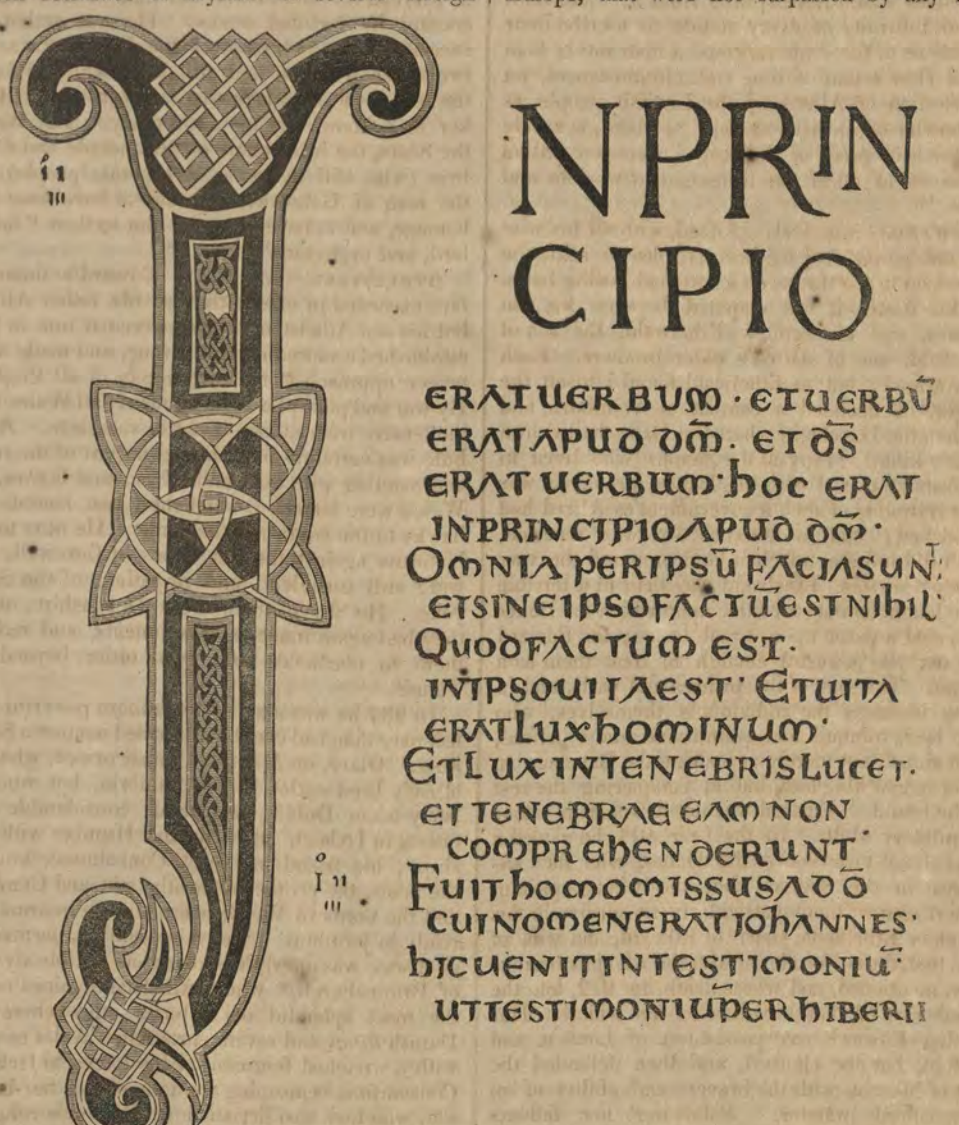
* Hist. Eng. ch. xi.

* Supposed by some to be Burn in the south of Lincolnshire, by others, Brugh in the north of the same county.

again to raise arms against Athelstane in any part of the island.

It appears to have been from this time that Athelstane laid aside the modest and limited title of his predecessors, and assumed that of "King of the Anglo-Saxons," or "King of the English"—titles which had been given to several of them in the letters of the Roman popes and bishops, but had never till now been used by the sovereigns themselves. His father, and his grandfather Alfred, had simply styled themselves kings of Wessex, or of the West Saxons.

Under Athelstane, the English court was polished to a considerable degree, and became the chosen residence or asylum of several foreign princes. Harold, the king of Norway, entrusted his son Haco to the care and tuition of the enlightened Athelstane; and this son, by the aid of England, afterwards succeeded to the Norwegian throne, on which he distinguished himself as a legislator. Louis d'Outremer, the French king, took refuge in London before he secured the throne; and even the Celtic princes of Armorica, or Brittany, when expelled their states by the Northmen or Normans, fled to the court of Athelstane, in preference to all others. He bestowed his sisters in marriage on the first sovereigns of those times, and, altogether, he enjoyed a degree of respect, and exercised an influence on the general politics of Europe, that were not surpassed by any living



PORTION OF THE FIRST CHAPTER OF THE GOSPEL OF ST. JOHN,—from the Cottonian MS. Tiberius, A. 2, a Copy of the Latin Gospels, which, from an inscription on the volume, appears to have been presented by King Athelstane to the Cathedral Church of Canterbury (Dorobernensis Cathedræ). This is believed to have been the volume on which the Anglo-Saxon kings after Athelstane took the Coronation Oath. From the names found on a page at the beginning, ODDA REX, and MIHTHILD MATER REGIS, it is conjectured by Mr. Turner to have been a present from the Empress Matilda of Germany, and her son the Emperor Otho, who married the sister of Athelstane.

sovereign.* A horrid suspicion of guilt—the crime of murdering his own brother Edwin—has been cast upon him; but this is scarcely proved by any cotemporary evidence, and his conduct as a sovereign seems almost irreproachable. He revised the laws, promulgated some new and good ones, made a provision for the poor and helpless, and encouraged the study of letters by earnest recommendations and by his own example. Like his grandfather Alfred, he was exceedingly fond of the Bible, and promoted the translation of it into the spoken language of the people. The life of this king was, in the words of William of Malmsbury, "in time little—in deeds great." Had it been prolonged, he might possibly have consolidated his power, and averted those tempests from the north which soon again desolated England. He died A.D. 940, being only in his forty-seventh year, and was buried in the abbey of Malmsbury.

Edmund the Atheling, his brother, who was not quite eighteen years old, succeeded to the throne. In him the family virtue of courage knew no blemish or decrease, and he showed a determined taste for elegance and improvement, which obtained for him the name of "the Magnificent;" but his reign was troubled from the beginning, and he was cut off in his prime by the hand of an assassin. He had scarcely ascended the throne when the Danes of Northumbria recalled from Ireland Anlaf, the old opponent of Athelstane at Brunnaburgh. The Danish prince came in force, and the result of a war was, that Edmund was obliged to resign to him, in separate sovereignty, the whole of the island north of Watling-street. But Anlaf did not enjoy these advantages many months; and when he died, Edmund repossessed himself of all the territory he had ceded. During his troubles the people of Cumbria, who had submitted to Athelstane, broke out in rebellion. He marched against them in 946, expelled their king, Dunmail, and gave the country as a fief to Malcolm of Scotland, whom he at the same time bound to defend the north of the island against Danish and other invaders. The two sons of Dunmail, whom he took prisoners, he barbarously deprived of their eyes. Such abominable operations, together with the amputating of limbs, cutting off of tongues and noses of captive princes, had become common on the continent; but, hitherto, had very rarely disgraced the Anglo-Saxons. Edmund did not long survive the perpetration of this atrocity. On the festival of St. Augustin, in the same year, as he was carousing with his nobles and officers, his eye fell upon a banished robber, named Leof, who had dared to mingle with the company. The royal cup-bearer or *dapifer* ordered him to withdraw. The robber refused. Incensed at his insolence, and heated by wine, Edmund started from his seat, and, seizing him by his long hair, tried to throw him to the ground. Leof had a dagger hid under his cloak, and in the scuffle he stabbed the king in a vital part. The desperate villain was cut to pieces by Edmund's servants, but not before he had slain and hurt divers of them. The body of the king was interred in Glastonbury Abbey, where Dunstan, who was soon to occupy a wider scene, was then Abbot.

Edred (946), who succeeded his brother Edmund, was another son of Edward the Elder, and grandson of Alfred. He was not twenty-three years old, but a loathsome disease had brought on a premature old age. He was afflicted with a constant cough,—he lost his teeth and hair,—and he was so weak in his lower extremities that he was nick-named "Edredus debilis pedibus" (Edred weak in the feet). According to some authorities, his mind was as feeble as his body, and the vigour that marked his reign sprung from the energy of Dunstan, the abbot of Glastonbury, who now began to figure as a statesman, and of Torketul, another churchman, who was Chancellor of the kingdom. Other writers, however, affirm that Edred's weak and puny body did not affect his mind, which was resolute and vigorous, and such as became a grandson of Alfred. Though, in common with the other states of the north, the Danes of Northumbria had sworn fealty to Edred at Tadwine's Cliff, they rose soon after his accession, and being joined by Eric and other princes and pirates from Denmark, Norway, Ireland, the Orkneys, and the Hebrides (where the sea-kings had established themselves), they once more tried the fortune of war with the Saxons. The operations of Edred's armies, though disgraced by cruelty and the devastation of the land, were marked with exceeding vigour and activity, and, after two or three most obstinate and sanguinary battles, they were crowned with success. The Danes in England, humbled, and apparently crushed, were condemned to pay a heavy pecuniary fine; Northumbria was incorporated with the rest of the kingdom much more completely than it had hitherto been, the royal title was abolished, and the administration put into the hands of an earl appointed by the king. Even the victorious Athelstane had left the title of king or sub-king to the Danish rulers of Northumbria; and it is assumed that the constant rebellions of those rulers were principally excited by their anxious wish to throw off the allegiance due to the English crown. We believe, however, there was a powerful excitement from without. The sea-kings still roamed the ocean in search of plunder or settlements; many princes or chiefs in Denmark and Norway claimed kindred with those who had made conquests and obtained kingdoms in England, and whenever an opportunity offered they pretended to those possessions by an indefeasible, hereditary right. Such a right might not be recognised by the Anglo-Saxons, but it would pass unquestioned among the Scandinavian rovers, who would profit by its being enforced. The names of a whole series of these Danish pretenders may probably be found in the mythical historians,—in the more than half fabulous

* Among the costly presents sent to Athelstane by foreign sovereigns, was one from the King of Norway, "of a goodly ship of fine workmanship, with gilt stern and purple sails, furnished round about the deck within with a row of gilt pavises (or shields)."

Edda and Sagas of the north,—but we are not aware that the discovery of them would cast any very important light on our annals.

Edred died soon after the reduction of Northumbria, and, leaving no children, was succeeded by the son of his brother and predecessor on the throne.

EDWY was a boy of fifteen when he began his troublous reign (A.D. 955). One of the first acts of his government seems to have been the appointment of his brother Edgar (whom the monks soon played off against him) to be sub-regulus or vassal-king of a part of England,* most probably of the old kingdom of Mercia, where he was to acknowledge Edwy's supremacy. As the Northumbrians remained in subjection, and as the Danes generally seem to have ceased from troubling the land, he might have enjoyed a tranquil reign but for some irregularities of his own, and his quarrels with a body more powerful then than warriors and sea-kings, and who fought with a weapon more deadly than the sword.

We now reach an interesting part of our history, which, after passing current for many ages, has been fiercely disputed by some recent writers, whose main course of argument is weakened by the glaring fact, that in shifting all the blame from Dunstan to Edwy, they had party or sectarian purposes to serve. For ourselves, who are perfectly impartial between a king and a monk, we think the old narrative has been disturbed without rendering any service to historical truth; and that this is proved to be the case, almost to a demonstration, by a learned and acute writer who has sifted the whole question.† Like nearly every other part of the Saxon history, the story of Edwy and Elgiva is certainly involved in some difficulties or obscurities. Avoiding discussion and disputations, we will briefly state the facts as they seem to us best established.

Edwy, who was gay, handsome, thoughtless, and very young, became enamoured of Elgiva, a young lady of rank, and married her although she was related to him in a degree within which the canonical laws forbade such unions. She was probably his first or second cousin, and we need not go nearer, as such marriages are still illegal in Catholic countries without the express dispensation of the Pope. Her mother Ethelgiva lived with her at the court of Edwy, and seems to have been a person of good repute, for, under the honourable designation of the "king's wife's mother," she attested an agreement between St. Ethelwold and the Bishop of Wells, to which three other bishops were subscribing witnesses. We are entitled to assume that had there been anything more than a slight infringement of church-law in the marriage of Elgiva, or had she and her mother been the depraved characters some writers have represented them, such personages as saints and bishops, and most orthodox churchmen, would not be found frequenting the court where both the ladies lived in pre-eminence and honour. Dunstan and his party, however, must surely have had other provocations than the irregularity of the marriage, or the thoughtlessness of Edwy in quitting their company, when they proceeded to the insolent extremities we are now to relate. On the day of the king's coronation the chief nobles and clergy were bidden to a feast, where they sate long carousing, deep in their cups, which they were too much accustomed to do.* The stomach of the youthful king may have been incapable of such potations,—his taste may have been revolted by such coarse excesses: he was still passionately enamoured of his beautiful bride, and, stealing from the banqueting hall, he withdrew with her and her mother to an inner apartment of the palace. His absence was remarked by Odo, the Archbishop of Canterbury, a Dane by birth,† a harsh, ambitious man, who may be more than suspected of having played false with Edwy's father, King Edmund, when engaged in the Northumbrian troubles, and obliged to renounce half the island to Anlaf. Odo was probably exasperated himself, and perceiving that the company were displeased at the king's leaving them, he ordered some persons to go and bring him back to partake of the general conviviality. The individuals addressed seem to have declined the office from motives of respect and decency, but Dunstan, the friend of Odo, feeling no such scruples, rushed to the inner apartment, dragged the young king from the side of his wife, and thrust him back into the banqueting-hall by main force. Such an outrage,—such a humiliation in the face of his assembled subjects,—must have passed Edwy's endurance. Nor was this all the wrong. While in the chamber Dunstan addressed the queen and her mother in the most brutal language, and threatened the latter with infamy and the gallows. The king had a ready rod wherewith to scourge the monk. Dunstan, among other offices, filled that of treasurer to Edred, the preceding sovereign, and Edwy had all along suspected him of having been guilty of peculation in his charge. If Edwy had ever whispered these suspicions,—and from his youth, imprudence, and hastiness of temper, he had probably done so often,—this alone would account for Dunstan's ire. However this may be, the fiery Abbot of Glastonbury, who returned from the festival to his abbey, was now questioned touching the moneys: his property was sequestered, his court places were taken from him, the monks who professed celibacy were driven out, and his monastery was given to the secular clergy, who still insisted on having wives like other men;

* "This fact, which is of some importance, is proved, like many other points of a similar description, not by historians, but by a charter. The document, however, does not designate the locality of the dominions assigned to Edgar." Palgrave, Hist. Eng. chap. xii. We follow this learned investigator in supposing it was Mercia.

† He was the son of one of the chieftains who had invaded England.

and finally a sentence of banishment was hurled at Dunstan. He fled for the monastery of St. Peter's in Ghent, but was scarcely three miles from the shore, on his way to Flanders, when messengers reached it,—despatched by Edwy or his mother-in-law,—and who, it is said, had orders to put out his eyes if they caught him in this country.

Before this extreme rupture Edwy had probably meddled with the then stormy politics of the church, or betrayed an inclination to favour the secular clergy in opposition to the monks; and this again would, and of itself, suffice to account for Dunstan's outrageous behaviour at the coronation feast. After Dunstan's flight the king certainly made himself the protector of the "married clerks;" for, expelling those who professed celibacy, he put the others in possession, not only of Glastonbury and Malmsbury, but of several other abbeys, which he thus made (to speak the language of Dunstan's adherents and successors) "styes for canons." In so doing Edwy, fatally for himself, espoused the weaker party, and still further exasperated Odo, the Archbishop of Canterbury, who entertained the same views in state matters and church discipline as his friend Dunstan.

The disputes of these churchmen of the tenth century, together with the extraordinary character of Dunstan, will be noticed more at length in the Chapter of Religious History. Here we have only indicated a few features to render intelligible the story, to the tragical conclusion of which we must now hasten. Shortly after the departure of Dunstan, a general rising of the people, instigated by Odo, took place in Northumbria (the reader will bear in mind that the Archbishop was a Dane), and a corresponding movement following under the same influence or holy sanction in Mercia, it was determined to set one brother in hostile array against the other; and, in brief time, Edgar was declared independent sovereign of the whole of the island north of the Thames! Dunstan then returned in triumph from his brief exile, which had scarcely lasted a year.

But while these events were in progress, and before they were completed, the young soul of Edwy was racked by an anguish more acute than any that could be caused by the loss of territory and empire. Some knights and armed retainers of the implacable Archbishop tore his beautiful wife Elgiva from one of his residences, branded her in the face with a red-hot iron to destroy her beauty, and then hurried her to the coast, whence she was transported to Ireland, probably as a slave. Her melancholy fate, her high birth, gracefulness, and youth (for she seems to have been now not more than sixteen or seventeen years old), probably gained her friends among a kind-hearted people. She was cured of the cruel wounds inflicted; her scars were obliterated, and, as radiant in beauty as ever, she was allowed (and no doubt insisted) to return to England. It is not clear whether Elgiva had actually joined her husband or was flying to his embraces when she was seized near Gloucester; but all the early accounts agree in stating that she was there barbarously mangled and hamstrung, and expired a few days after in great torture. The generally received statement is, that the perpetrators of this atrocious deed were armed retainers of the Archbishop Odo: others, however, are of opinion that the young queen fell into the hands of the Mercians, who were in insurrection against her husband, and that in neither case was the execution ordered either by Odo or Dunstan. However this may be, the deed was undeniably done by the adherents of those churchmen (for the Mercians were armed in their quarrel), and praised as an act of inflexible virtue by their encomiasts. The palliation set up by a recent historian, who cannot deny the fact of the hamstringing, that such a mode of punishment, "though cruel, was not unusual in that age," leaves the question of justice and law untouched, and seems to us to be conceived in the spirit of an inquisitor of the worst ages. Edwy did not long survive his wife: he died in the following year (958), when he could not have been more than eighteen or nineteen years old. His death is generally attributed to grief and a broken heart, but it is just as probable that he was assassinated by his enemies.* From the comeliness of his person, he was generally called Edwy the Fair.

Edgar (958-9), his brother, who had been put forward against him in his life-time, now succeeded to all his dignities. As a boy of fifteen, he could exercise little authority: he was long a passive instrument in the hands of Dunstan and his party, who used their power in establishing their cause, in enforcing the celibacy of the clergy, and in driving out, by main force, from all abbeys, monasteries, cathedrals, churches, and chantries, all such married clergymen as would not separate from their wives. At the same time, it cannot be denied that Dunstan and the monks ruled the kingdom with vigour and success, and consolidated the detached states into compacter integrity and union than had ever been known before. Several causes favoured this process. Among others, Edgar, who had been brought up among the Danes of East Anglia and Northumbria, was endeared to that people, who, in consequence, allowed him to weaken their states by dividing them into several separate earldoms or governments, and to make other innovations, which they would have resented under any of his predecessors with arms in their hands. His fleet was also wisely increased to the number of 360 sail; and these ships were so well disposed, and powerful squadrons kept so constantly in motion, that the sea-kings were kept in check on their own element, and prevented from landing and troubling the country. At the same time, tutored by the indefatigable Dunstan, who soon was made, or rather who soon made himself, Archbishop of Canterbury, the king accustomed himself to visit in person every

* An old MS. in the Cottonian Library says explicitly, "in pago Glocestrensi interfectus fuit." Another old MS. quoted by Mr. Sharon Turner says, "misera morte exspiravit;" but this would apply as well (or better) to death by grief as to death by the dagger.

part of his dominions annually. In the land progresses he was attended by the primate or by energetic ministers of Dunstan's appointing; and as he went from Wessex to Mercia, from Mercia to Northumbria, courts of justice were held in the different counties, audiences and feasts were given, appeals were heard, and Edgar cultivated the acquaintance of all the nobles and principal men of the kingdom. The neighbouring princes—his vassals or allies—of Wales, Cumbria, and Scotland, were awed into respect or obedience, and on several occasions seem to have bowed before his throne. When he held his court at Chester, and had one day a wish to visit the monastery of St. John's, on the river Dee, eight crowned kings (so goes the story) plied the oars of his barge while he guided the helm. These sovereign-bargemen are said to have been, Kenneth, king of Scotland, Malcolm, his son, king of Cumbria, Maccus the Dane, king of Anglesey, the isle of Man, and the Hebrides, the Scottish kings of Galloway and "Westmere," and the three Welsh kings of Dynwall, Siferth, and Edwall.

Edgar certainly bore prouder and more sounding titles than any of his predecessors. He was styled Basileus, or Emperor, of Albion, King of the English, and of all the nations and islands around.* He obtained the more honourable epithet of the Peaceable, or Pacific; for, luckily, during his whole reign, his kingdom was not troubled by a single war. He commuted a tribute he received from a part or the whole of Wales, into 300 wolves' heads annually, in order to extirpate those ravenous animals; and, according to William of Malmsbury, this tribute ceased in the fourth year, for want of wolves to kill. The currency had been so diminished in weight by the fraudulent practice of clipping, that the actual value was far inferior to the nominal. He therefore reformed the coinage, and had new coins issued all over the kingdom. Though Edgar was now in mature manhood, there is pretty good evidence to show that these measures, with others, generally of a beneficial nature, were suggested and carried into effect by Dunstan, who, most indubitably, had his full share in the next operations which are mentioned with especial laud and triumph by the monkish writers. He made married priests so scarce or so timid, that their faces were nowhere to be seen; and he founded or restored no fewer than fifty monasteries which were all subjected to the rigid rules of the Benedictine order. It is curious that the monks, who had a debt of gratitude to pay, and who, in their summary of his whole character, indeed, uphold Edgar as a godly, virtuous prince, should have recorded actions which prove him to have been one of the most viciously profligate of the Saxon kings. The court of this promoter of celibacy and chastity swarmed at all times with concubines, some of whom were obtained in the most violent or flagitious manner. To pass over less authentic cases, in an early part of his reign, during the life of his first wife, he carried off from the monastery of Wilton a beautiful young lady of noble birth, named Wulfreda, who was either a professed nun, or receiving her education under the sacred covering of the veil. It has been said that Dunstan here interfered with a courage which absolves him from the charge of reserving his reproofs for those who stood like the unfortunate Edwy in the position of enemies. But what was the amount of his interference in this extreme case, where the sanctity of the cloister itself was violated? He condemned the king to lay aside an empty, inconvenient bauble—not to wear his crown on his head for seven years,—and to a penance of fasting, which was probably in good part performed by deputy. This was not the measure of punishment that was meted out to Edwy; and, for all that we can learn to the contrary, Edgar was allowed to retain Wulfreda as his mistress! On another occasion, when the guest of one of his nobles at Andover, he ordered that the fair and honourable daughter of his host should be sent to his bed. The young lady's mother artfully substituted a handsome slave, or servant; and this menial was added to his harem, or taken to court, where, according to William of Malmsbury, she enjoyed his exceeding great favour until he became enamoured of Elfrida, his second *lawful* wife. Romantic as are its incidents, the story of his marriage with the execrable Elfrida rests on about as good authority as we can find for any of the events of the time. The fame of this young lady's beauty reached the ears of Edgar, ever hungry of such reports. To ascertain whether her charms were not exaggerated, the royal voluptuary despatched Athelwold, his favourite courtier, to the distant castle of her father, Ordgar, earl of Devonshire, with whom she resided. Athelwold became himself enamoured of the beauty, wedded her, and then represented her to the king as being rich, indeed, but not otherwise commendable. Edgar suspected, or was told, the real truth. He insisted on paying her a visit. The unlucky husband was allowed to precede him, that he might put his house in order; but he failed in his real object, which was to obtain his wife's forgiveness for having stepped between her and a throne, and to induce her to disguise or conceal the brilliancy of her charms by homely attire and rustic demeanour. The visit was made; the king was captivated, as she intended he should be. Soon after Athelwold was found murdered in a wood, and Edgar married his widow. This union, begun in crime, led to the foul murder of Edgar's eldest son; and under the imbecile Ethelred, the only son he had by Elfrida, the glory of the house of Alfred was eclipsed for ever. He himself did not survive the marriage more than six or seven years, when he died at the early age of thirty-two, and was buried in the abbey of Glastonbury, which he had made magni-

* "Nothing," says Mr. Turner, "can more strongly display Edgar's vanity than the pompous and boasting titles which he assumes in his charters. They sometimes run to the length of fifteen or eighteen lines. How different from Alfred's "Ego occidentalium Saxonum Rex."—Hist. Anglo-Sax.

Costume of King Edgar, a Saxon Lady, and a Page.

ficent by vast outlays of money and donations of land.

Edward, commonly called the Martyr, who succeeded A.D. 975, was Edgar's son by his first marriage. Like all the kings since Athelstane, he was a mere boy at his accession, being not more than fourteen or fifteen years old. His rights were disputed, in favour of her own son, Ethelred, who was only six years old, by the ambitious and remorseless Elfrida, who boldly maintained that Edward, though the elder brother, and named king in his father's will, was excluded by the illegitimacy of his birth. The legitimacy of several of the Saxon princes who had worn the crown was more than doubtful; but in the case of Edward the challenge seems to have been unfounded. The cause of Edward and his half-brother was decided on far different grounds. As soon as Edgar was dead the church war was renewed, and Dunstan, after a long and unopposed triumph, was compelled once more to descend to the arena with his old opponents the "married clerks," or secular clergy, who again showed themselves in force in many parts of the kingdom, and claimed the abbeys and churches of which they had been dispossessed. The nobles and the governors of provinces chose different sides. Alfere, the powerful eolderman of Mercia, declared for the secular clergy, and drove the monks from every part of his extensive dominions: Alwyn of East Anglia, on the contrary, stood by Dunstan and the monks, and chased the seculars. Elfrida, no doubt because Dunstan and his friends had got possession of Edward, gave the weight of her son Ethelred's name and herself to the party of Alfere and the seculars, which soon proved again to be the weaker of the two factions. Had it been the stronger, Ethelred would have been crowned; as it turned out, Dunstan was enabled to place Edward upon the throne. But the animosities of two religious parties were not to

be reconciled by the decisions of national or church councils, by disputations, or even by miracles; nor was the ambition of the perfidious Elfrida to be cured by a single reverse. She continued her intrigues with the secular party; she united herself more closely than ever with Alfere, the eolderman of Mercia; and soon saw herself at the head of a powerful confederacy of nobles, who were resolved her son should reign, and Dunstan be deprived of that immense power he had so long held. But not even this resolution would prepare us for the horrible catastrophe that followed. About three years after his accession, as Edward was hunting one day in Dorsetshire, he quitted his company and attendants to visit his half-brother, Ethelred, who was living with his mother, hard by, in Corfe Castle. Elfrida came forth with her son to meet him at the outer gate: she bade him welcome with a smiling face, and invited him to dismount; but the young king, with thanks, declined, fearing he should be missed by his company, and craved only a cup of wine, which he might drink in his saddle to her and his brother, and so be gone. The wine was brought, and as Edward was carrying the cup to his lips one of Elfrida's attendants stabbed him in the back. The wounded king put spurs to his horse, but soon fainting from loss of blood, he fell out of the saddle, and was dragged by one foot in the stirrup through woods and rugged ways until he was dead. His but too negligent companions in the chase traced him by his blood, and at last found his disfigured corpse, which they burned, and then buried the ashes of it at Wareham without any pomp or regal ceremonies. "No worse deed than this," says the Saxon chronicle, "had been committed among the people of the Angles since they first came to the land of Britain."

It is believed that Alfere, the eolderman of Mercia, with other nobles opposed to Dunstan and the monks, was engaged with the queen-dowager in a plot to assassinate Edward, but that Elfrida impatiently seizing an unlooked-for opportunity, took the bloody execution instantly and wholly upon herself. The boy ETHELRED, who was not ten years old, had no part in the guilt which gave him a crown, though that crown certainly sate upon him like a curse. It is related of him that he dearly loved his half-brother Edward, and wept his death, for which his virago mother, seizing a large torch at hand, beat him with it until he was almost dead himself. Such, however, was the popular odium that fell both on son and mother, that an attempt was made to exclude him from the throne by substituting Edgitha, Edgar's natural daughter by the lady he had stolen from the nunnery of Wilton. This Edgitha was herself at the time a professed nun in the same monastery from which her mother had been torn; and it is said that nothing but her timidity, and the dread inspired by her brother Edward's murder, and her firm refusal to exchange the tranquillity of the cell for the dangers of the throne, prevented Dunstan from causing her to be proclaimed Queen of all England. There was no other prince of the blood royal,—no other pretender to set up,—so the prelates and thanes, with no small repugnance, were compelled to bestow the crown on the son of the murderess; and Dunstan, as primate, at the festival of Easter (A.D. 979), put it on his weak head in the old chapel of Kingston, at this time the usual crowning place of the Saxon monarchs. The vehement monk, who was now soured

St. MARY'S CHAPEL at Kingston, in which Kings Edred, Edward the Martyr, and Ethelred are stated to have been crowned, as it appeared about fifty years since, before its destruction by the falling of the church wall, against which it was built.

by age, and exasperated at the temporary triumph of his enemies, is said to have pronounced a malediction on Ethelred, even in the act of crowning him, and to have given public vent to a prophecy of woe and misery, which some think was well calculated to insure its own fulfilment,—for Dunstan already enjoyed among the nation the reputation of being both a seer and a saint, and the words he dropped could hardly fail of being treasured in the memory of the people, and of depressing their spirits at the approach of danger. Ethelred, moreover, began his reign with an unlucky nickname, which it is believed was given him by Dunstan,—he was called "the Unready." His personal and moral qualities were not calculated to overcome a bad prestige, and the unpopular circumstances attending his succession: in him the people lost their warm affection for the blood of Alfred, and by degrees many of them contemplated with indifference, if not with pleasure, the transfer of the crown to a prince of Danish race. This latter feeling more than half explains the events of his reign. During the first part of the minority the infamous Elfrida enjoyed great authority, but, as the king advanced in years, her influence declined, and followed by the execrations of nobles and people (even by those of her own party), she at last retired to expiate her sins, according to the fashion of the times, in building and endowing monasteries.

Although the Northmen settled in the Danelagh had so frequently troubled the peace of the kingdom, and had probably at no period renounced the hope of gaining an ascendancy over the Saxons of the island, and placing a king of their own race on the throne of England, the Danes beyond sea had certainly made no formidable attacks since the time of Althelstane, and of late years had scarcely been heard of. This suspension of hostility on their part is not to be attributed solely to the wisdom and valour of the intermediate Saxon kings. There were great political causes connected with the histories of Norway and Denmark, and France and Normandy, and circumstances which, by giving the Danes employment and settlement in other countries, kept them away from England. But now, when unfortunately there was neither wisdom or valour in the king and council, nor spirit in the people, these extraneous circumstances had changed, and instead of checking, they threw the men of the North on our shores.

Sweyn, a son of the king of Denmark, had quarrelled with his father, and been banished from his home. Young, brave, and enterprising, he soon collected a host of mariners and adventurers round his standard, with whom he resolved to obtain wealth, if not a home, in our island. His first operations were on a small scale, intended merely to try the state of defence of the island, and were probably not conducted by himself.

In the third year of Ethelred's reign (A.D. 981) the Danish raven was seen floating in Southampton water, and that city was plundered, and its inhabitants carried into slavery. In the course of a few months Chester and London partook of the fate of Southampton, and attacks were multiplied on different points,—in the north, in the south, and in the west, as far as the extremity of Cornwall. These operations were continued for some years, during which Ethelred seems to have been much occupied by quarrels with his bishops and nobles. Alfere, the Mercian, who had conspired with Elfrida against Edward the Martyr, was dead, and his extensive earldom had fallen to his son Alfric,—a notorious name in these annals. In consequence of a conspiracy, real or alleged, this Alfric was banished. The weak king was soon obliged to recall him, but the revengeful nobleman never forgot the past. In the year 991 a more formidable host of the sea-kings ravaged all that part of East Anglia that lay between Ipswich and Maldon, and won a great battle, in which Earl Brithnoth, a Dane by descent, but a Christian, and a friend to the established government, was slain. Ethelred, then, for the first time, had recourse to the fatal expedient of purchasing their forbearance with money. Ten thousand pounds of silver were paid down, and the sea-kings departed for a while, carrying with them the head of Earl Brithnoth as a trophy. In the course of the following year the witenagemot adopted a wiser plan of defence. A formidable fleet was collected at London, and well manned and supplied with arms. But this wise measure was defeated by Alfric the Mercian, who, in his hatred to the king, had opened a correspondence with the Danes, and being entrusted with a principal command in the fleet, he went over to them on the eve of a battle with many of his ships. The traitor of course escaped, and Ethelred wreaked his savage vengeance on Elfgar, the son of Alfric, whose eyes he put out. In 993 a Danish host landed in the north, and took Bamborough Castle by storm. Three chiefs of Danish origin, who had been appointed to command the natives, threw down the standard of Ethelred, and ranged themselves under the raven. All through Northumbria and the rest of the Danelagh the Danish settlers gradually either joined their still Pagan brethren from the Baltic, or offered them no resistance. In the mean time the fortunes of Sweyn the exile had undergone a change. By the murder of his father he had ascended the throne of Denmark, and, formidable himself, he had gained a powerful ally in Olave, king of Norway, a prince of the true Scandinavian race,—a son of an old pirate who, in former times, had often pillaged the coast of England. In 994 the two north kings ravaged all the southern provinces of our island, doing "unspeakable harm," and meeting nowhere with a valid resistance. It was again agreed to treat, and buy them off with money. Their pretensions of course rose, and this time *sixteen* thousand pounds of silver were exacted and paid. By a clause in the treaty Olave and some chiefs were bound to embrace the Christian religion. Sweyn had been baptized already more than once, and had relapsed

to idolatry. One of the chiefs boasted that he had been washed *twenty times* in the water of baptism; by which we are to understand that the marauder had submitted to what he considered an idle ceremony whenever it suited his convenience. Olave, the Norwegian king, however, stood at the fount with a better spirit; his conversion was sincere; and an oath he there took, never again to molest the English, was honourably kept. During the four following years the Danes continued their desultory invasions; and when (in 998) Ethelred had got ready a strong fleet and army to oppose them, some of his own officers gave the plunderers timely warning, and they retreated unhurt. On their next returning in force (A.D. 1001), Ethelred seems to have had neither fleet nor army in a condition to meet them; for, after two conflicts by land, they were allowed to ravage the whole kingdom from the Isle of Wight to the Bristol Channel, and then they were stayed not by steel, but by gold. Their price, of course, still rose: this time twenty-four thousand pounds were paid to purchase their departure. These large sums were raised by direct taxation upon land; and the "Dane-geld," as it was called, was an oppressive and most humiliating burden that became permanent. Nor was this all. The treaties of peace or truce generally allowed bands of the marauders to winter in the island at Southampton or some other town; and during their stay the English people, whom they had plundered and beggared, were obliged to feed them. Their appetites had not decreased since the days of Guthrun and Hasting.

As if the Danes were not enemies enough, Ethelred had engaged in hostilities with Richard II., Duke of Normandy, and had even, at one time, prepared an armament to invade his dominions. The quarrel was made up by the mediation of the Pope; and then the English king, who was a widower, thought of strengthening his hands by marrying Emma, the Duke of Normandy's sister. The alliance, which laid the first grounds for the pretext of Norman claims on England, afterwards pressed by William the Conqueror, was readily accepted by the Duke Richard, and in the spring of 1002 Emma, "the Flower of Normandy," as she was styled, arrived at the court of Ethelred, where she was received with great pomp.

The long rejoicings for this marriage were scarcely over when a memorable atrocity suddenly covered the land with blood and horror. This was the sudden massacre of the Danes, perpetrated by the people with whom they were living intermixed as fellow-subjects. It is universally asserted that the plot was laid beforehand,—the fatal order given by the king himself; and there is little in Ethelred's general conduct and character to awaken a doubt in his favour. At the same time, be it observed, the people must have been as guilty, as secret, as treacherous, as cruel, as the king; and must have entered fully into the spirit which dictated the bloody order of which they were to be the executioners. Such being the case, we think they were fully equal to the conception of the plot themselves, and that, from the loose, unguarded manner in which the Danes lived scattered among them, such a mode of disposing of them would naturally suggest itself to a very imperfectly civilized people, maddened by the harsh treatment and insults of their invaders. In the simultaneous massacre of the French invaders all over Sicily in 1282 the same mystery was observed; but it is still a matter of doubt whether the "Sicilian vespers" were ordered by John of Procida or sprung spontaneously from the people. These two cases, which belong alike to the class of the terrible acts of vengeance that signalise a nation's despair, are nearly parallel in their circumstances; and in England, as afterwards in Sicily, it was the insults offered by the invaders to their women that extinguished the last sentiments of humanity in the hearts of the people. The outrages of the Danish *pagans* were extreme. According to the old chroniclers, they made the English yeomanry, among whom they were settled, perform the most menial offices for them; they held their houses as their own, and, eating and drinking of the best, scantly left the real proprietor his fill of the worst: the peasantry were so sorely oppressed that, out of fear and dread, they called them, in *every house where they had rule*, "Lord Danes." Their wives and daughters were everywhere a prey to their lust, and when the English made resistance or remonstrance, they were killed or beaten, and laughed at. All this description seems to point at soldiers and adventurers, and men recently settled in the land, and not to the converted married Danes, who had been living a long time in different parts of the country (as well as in the Danelagh, where they were too numerous to be touched), who had contracted quiet, orderly habits, and successfully cultivated the friendship of the English. It was resolved, however, to destroy them all at one blow,—the good with the bad,—the innocent infant at the breast with the hardened ruffian,—the neighbour of years with the intruder of yesterday. As the story is told, Ethelred sent secretly to all his good burghs, cities, and towns, charging the rulers thereof to rise, all on a fixed day and hour, and, by falling suddenly on the Danes, exterminate them from the land by sword and fire. By whatever means this simultaneous movement was arranged, it certainly took place. On the 13th of November 1002, (the holy festival of St. Brice,) the Danes, dispersed through a great part of England, were attacked by surprise, and massacred without distinction of quality, age, or sex, by their hosts and neighbours. Gunhilda, the sister of Sweyn, king of Denmark, who had embraced Christianity and married an English earl of Danish descent, after being made to witness the execution of her husband and child, was barbarously murdered herself.

This tale of horror was soon wafted across the ocean, where Sweyn prepared for a deadly revenge. He assembled a fleet more numerous than any that had hitherto invaded England. The Danish war-

riors considered the cause a national and sacred one; and in the assembled host there was not a slave, or an emancipated slave, or a single old man, but every combatant was a free man, the son of a free man, and in the prime of life.*

These choice warriors embarked in lofty ships, every one of which bore the ensign or standard of its separate commander. Some carried at their prow such figures as lions, bulls, dolphins, dragons, or armed men, all made of metal and gaily gilded; others carried on their topmast-head the figures of large birds, as eagles and ravens, that stretched out their wings and turned with the wind: the sides of the ships were painted with different bright colours, and, larboard and starboard, from stem to stern, shields of burnished steel were suspended in even lines, and glittered in the sun. Gold, silver, and embroidered banners were profusely displayed, and the whole wealth of the pirates of the Baltic was made to contribute to this barbaric pomp. The ship that bore the royal standard of Sweyn was moulded in the form of an enormous serpent, the sharp head of which formed the prow, while the lengthening tail coiled over the poop. It was called "The Great Dragon." The first place where the avengers landed was near Exeter, and that important city was presently surrendered to them through the treachery of Ethelred's governor, a Norman nobleman, and one of the train of favourites and dependants that had followed Queen Emma. After plundering and dismantling Exeter, the Danes marched through the country into Wiltshire, committing every excess that a thirst for vengeance and rapine could suggest. In all the towns and villages through which they passed, after gaily eating the repasts the Saxons were forced to prepare for them, they slew their hosts, and, departing, set fire to their houses.† At last an Anglo-Saxon army was brought up to oppose their destructive progress; but this force was commanded by another traitor,—by Alfric the Mercian,—who had already betrayed Ethelred, and whose son, in consequence, had been barbarously blinded by the king. We are not informed by what means he had been restored to favour and employment after such extreme measures; but Alfric now took the opportunity offered him for further revenge on the king. He pretended to be seized with a sudden illness, called off his men when they were about to join battle, and permitted Sweyn to retire with his army and his immense booty through Salisbury to the sea-coast. In the following year Norwich was taken, plundered and burnt, and the same fate befell nearly every town in Norfolk, Suffolk, Cambridgeshire, Huntingdonshire, and Lincolnshire. The Danes then (A.D. 1004) returned to the Baltic, retreating from a famine which their devastations had caused in England.

By marrying the Norman princess Emma, Ethelred had hoped to secure the assistance of her brother, Duke Richard, against the Danes; but it was soon found that the only Normans who crossed the Channel were a set of intriguing, ambitious courtiers, hungry for English places and honours; and by his inconstancy and neglect of his wife, Ethelred so irritated that princess that she made bitter complaints to her brother, and caused a fresh quarrel between England and Normandy. Duke Richard seized all the native English who chanced to be in his dominions, and, after shamefully killing some, threw the rest into prison. According to Walsingham, and some of the old Norman writers, Ethelred then actually sent a force to invade Normandy, and this force, after effecting a landing near Coutances, was thoroughly defeated. We are inclined to believe that the expedition was less important than the Norman chronicles represent it, but it shows the impolicy of the Saxon king, and had, no doubt, some effect in weakening an already weak and dispirited nation.

In 1006 Sweyn, whose vengeance and rapacity were not yet satisfied, returned, and carried fire and sword over a great part of the kingdom; and when it was resolved in the great council to buy him off with gold, 36,000*l.* was the sum demanded. The frequent raising of these large sums utterly exhausted the people, whose doors were almost constantly beset either by the king's tax-gatherers or the Danish marauders. Those few who had, as yet, the good fortune of escaping the pillage of the Danes, could not now escape the exactions of Ethelred, and, under one form or another, they were sure of being plundered of all they possessed. By an insolent and cruel mockery the royal tax-gatherers were accustomed to demand an additional sum from those who had paid money to the Danes directly, in order to save their persons and their houses from destruction, affecting to consider such transactions with the enemy as illegal.

In 1008 the people were oppressed with a new burden; but had this been properly apportioned, had the country been less exhausted, and had the measure for which the money was to be applied been carried vigorously and honestly into effect, it seems as if it ought to have saved England from the Danes. Every 310 hides of land were charged with the building and equipping of one ship for the defence of the kingdom; and in addition to this, every nine hides of land were bound to provide one man, armed with a helmet and iron breastplate. It is calculated that, if all the land which still nominally belonged to Ethelred had supplied its proper contingent, more than 800 ships, and about 35,000 armed men, would have been provided. The force actually raised is not stated, but, in spite of the exhaustion of the country, it appears to have been large; some of the old writers stating, particularly as to the marine, that there never were so many ships got together in England before. This fleet, however, was soon rendered valueless by dissentions and treachery at home. Ethelred, who had always a favourite of some kind, was now governed by Edric, a man of low birth, but eloquent, clever, and ambitious. He obtained in

* Sax. Chron.
† Hen. Hunting. Hist.

marriage one of the king's daughters, and about the same time one of the highest offices in the state. His family shared, as usual, in his promotion. Brihtric, the brother of this powerful favourite, conspired against Earl Wulfnoth. Wulfnoth fled, and carried twenty of the new ships with him, with which he plundered all the southern coast of England, even as if he had been a Danish pirate. Eighty other ships were placed under the command of Brihtric, who pursued the man he had sought to ruin. A storm arose; these eighty vessels were wrecked on the coast, where Wulfnoth succeeded in burning them all; and then the rest of the king's fleet appear to have dispersed in anarchy and confusion. This story, like so many others of the period, is imperfectly told; but the annalists agree in stating that the new navy was dissipated or lost; and that thus perished the last hope of England.

As soon as the intelligence of this disaster reached the mouth of the Baltic a large army of Danes, called, from their leader, "Thurkill's host," set sail for England, where, during the three following years, they committed incalculable mischief, and, by the end of that period, had made themselves masters of a large part of the kingdom. They now and then sold short and uncertain truces to the Saxons, but they never evinced an intention of leaving the island, as Sweyn had left it on former occasions, when well loaded with gold. As Ethelred's difficulties increased he was surrounded more and more by the basest treachery, and he seems, at last, not to have had a single officer on whom he could depend. During this lamentable period of baseness and cowardice a noble instance of courage and firmness occurred in the person of a churchman. Alphege, Archbishop of Canterbury, defended that city for twenty days, and when a traitor opened its gate to the Danes, and he was made prisoner and loaded with chains, he refused to purchase liberty and life with gold, which he knew must be wrung from the people. Tired out by his resistance, they thought to overcome it by lowering the rate of his ransom; and they proposed to take a small sum from him, if he would engage to advise the king to pay them a further amount as a largess. "I do not possess so much money as you demand from me," replied the Saxon archbishop, "and I will not ask or take money from any body, nor will I advise my king against the honour of my country." He continued immovable in this resolution, even refusing the means of ransom voluntarily offered by his brother, saying, it would be treason in him to enrich, in any degree, the enemies of England. The Danes, more covetous of money than desirous of his blood, frequently renewed their demands. "You press me in vain," said Alphege; "I am not the man to provide Christian flesh for Pagan teeth, by robbing my poor countrymen to enrich their enemies." The Danes, at length, lost patience, and one day, when they were assembled at a drunken banquet, they caused him to be dragged into their presence. "Gold, bishop! give us gold! gold!" was their cry, as they gathered about him in menacing attitudes. Still unmoved, he looked round that circle of fierce men, who presently broke up in rage and disorder, and running to a heap of bones, horns, and jaw-bones, the remains of their gross feast, they threw these things at him, until he fell to the ground half dead. A Danish pirate whom he had previously converted, or, at least, baptized with his own hands, then took his battle-axe and put an end to the agony and life of Archbishop Alphege.*

This heroic example had no effect upon king Ethelred, who continued to pay gold as before. After receiving 48,000*l.* (for still their demands rose), and the formal cession of several counties, Thurkill took the oaths of peace, and became, with many of his chiefs, and a large detachment of his host, the ally and soldier of the weak Saxon monarch. It is probable that Earl Thurkill entered the service of Ethelred for the purpose of betraying him, and acted all along in concert with Sweyn; but the Danish king affected to consider the compact as treason to himself, and, with a show of jealousy towards Thurkill, prepared a fresh expedition, which he gave out was equally directed against Ethelred and his vassal Thurkill. The fact, at all events was, that Sweyn, who had so often swept the land from east to west, from north to south, had now resolved to attempt the permanent conquest of our island. He sailed up the Humber with a numerous and splendid fleet, and landed as near as he could to the city of York. As the Danes advanced into the country, they stuck their lances into the soil, or threw them into the current of the rivers, in sign of their entire domination over England. They marched, escorted by fire and sword, their ordinary satellites.† Nearly all the inhabitants of the Danelagh joined them at once: the men of Northumbria, Lindesey, and the "Five Burghs," welcomed the banner of Sweyn, and finally all the "Host" north of Watling-street took up arms in his favour.‡ Even the provinces in the centre of England, where the Danish settlers or troops were far less numerous, prepared themselves for a quiet surrender. Leaving his fleet to the care of his son Canute, Sweyn conducted the main body of his army to the south, exacting horses and provisions as he marched rapidly along. Oxford, Winchester, and other important towns threw open their gates at his approach; but he was obliged to retire from before the walls of London and the determined valour of its citizens, among whom the king had taken refuge. Sweyn then turned to the west, where he was received with open arms. The eolderman of Devonshire and nearly every other thane in that part of the kingdom repaired to his head-quarters at Bath, and did homage to him as their lawful or chosen sovereign. Seeing the whole kingdom falling from him, Ethel-

red abandoned London, which soon followed the general example, and submitted to the Danes. This unready king then fled to the Isle of Wight, whence he secretly sent his children with Emma, his Norman wife, to the court of her brother at Rouen. He was for some short time doubtful where he should lay his own head; for, after the hostilities and insults which had passed between them, he reasonably doubted the good-will of his brother-in-law. The Duke of Normandy, however, not only received Emma and her children with great kindness, but offered a safe and honourable asylum to Ethelred, which that luckless prince was fain to accept as his only resource.

Sweyn was now (about the middle of January, 1013) acknowledged as "Full King of England;" but the power which had been obtained with so much labour, and at the expense of so much bloodshed and wretchedness, remained to the conqueror a very short time. He died suddenly at Gainsborough; and, only six weeks after the time when he had been allowed to depart for Normandy, "abandoned, deserted, and betrayed" by all, Ethelred was invited by the Saxon nobles and prelates to return and take possession of his kingdom, which was pledged to his defence and support—*provided only that he would govern them better than he had done before.* Ethelred, before venturing himself, sent over his son Edward, with solemn promises and assurances. Pledges were exchanged for the faithful performance of the new compact between king and people. A sentence of perpetual outlawry was pronounced against every king of Danish name and race; and, before the end of Lent, Ethelred was restored to those dominions which he had already misgoverned thirty-five years. In the mean time, the Danish army in England had proclaimed Canute, the son of Sweyn, as king of the whole land; and in the northern provinces they and their adherents were in a condition to maintain the election they had made. Indeed, north of Watling-street, the Danes were all powerful; and Canute, though beset by some difficulties, was not of a character to relinquish his hold of the kingdom without a hard struggle. A sanguinary warfare was renewed, and, murdering and bribing, betraying and betrayed, Ethelred was fast losing ground when he died of disease, about three years after his return from Normandy.

The law of succession continued as loose as ever; and, in seasons of extreme difficulty like the present, when so much depended on the personal character and valour of the sovereign, it was altogether neglected or despised. Setting aside Ethelred's legitimate children, the Saxons chose for their king a natural son, Edmund, surnamed *Ironside*, who had already given many proofs of courage in the field and wisdom in the council. By general consent, indeed, Edmund was a hero; but the country was too much worn out and divided, and the treasons that had torn his father's court and camp were too prevalent in his own to permit of his restoring Saxon independence throughout the kingdom. After twice relieving London, when besieged by Canute and all his host, and fighting five pitched battles with unvarying valour, but with various success, Ironside proposed that he and his rival should decide their claims in a single combat, saying "it was pity so many lives should be lost and perilled for their ambition."* Canute declined the duel, saying, that he, as a man of slender make, would stand no chance with the stalwart Edmund; and he added, that it would be wiser and better for them both to divide England between them, even as their forefathers had done in other times. This proposal is said to have been received with enthusiastic joy by both armies, and, however the negotiation may have been conducted, and whatever was the precise line of demarcation settled between them, it was certainly agreed that Canute should reign over the north, and Edmund Ironside over the south, with a nominal superiority over the Dane's portion. The brave Edmund did not survive the treaty more than two months. His death, which took place on the feast of St. Andrew, was sudden and mysterious. As Canute profited so much by it, as to become sole monarch of England immediately after, it is generally believed he planned his assassination; but, judging from the old chroniclers who lived at or near the time, it is not clear who were the contrivers and actual perpetrators of the deed, or whether he was killed at all. There is even a doubt as to the place of his death, whether it was London or Oxford.

Silver Coin of Canute.—From a Specimen in the British Museum.

Canute. A.D. 1017. Although the death of Edmund removed all obstacles, and the south lay prostrate before the Danes, Canute began with a show of law and moderation. A great council of the bishops, "duces," and "optimates," was convened at London; and before them Canute appealed to those Saxons who had been witnesses to the convention and treaty of partition between himself and Edmund, and called upon them to state the terms upon which the compact was concluded. Intimidated by force, or won by promises, and the hopes of conciliating the favour of the powerful survivor, who seemed certain to be king, with or without their consent, they all loudly testified that Edmund had never intended to reserve any right of succession to his brothers, the sons of Ethelred, who were absent in Normandy, and that it was his (Edmund's) express wish that Canute should be the guardian of his own children during their infancy. The most imperfect and faint semblance of a right being thus established, the Saxon chiefs took an oath of fidelity to Canute, as king of all

* Malmsb.

England; and Canute, in return, swore to be just and benevolent, and clasped their hands with his naked hand, in sign of sincerity. A full amnesty was promised; but the promise had scarcely passed the royal lips ere Canute began to proscribe those whom he had promised to love. The principal of the Saxon chiefs who had formerly opposed him, and the relations of Edmund and Ethelred, were banished or put to death. "He who brings me the head of one of my enemies," said the ferocious Dane, "shall be dearer to me than a brother." The witenagemot, or parliament, which had so recently passed the same sentence against the Danish princes, now excluded all the descendants of Ethelred from the throne. They declared Edwy, a grown up brother of Ironside, an outlaw, and when he was pursued and murdered by Canute, they tacitly acknowledged the justice of that execution. This Edwy bore the curious title of "King of the Churls, or Peasants," concerning the proper meaning of which there have been some disputes. We incline to the opinion of a recent writer—that this designation did not imply a real dignity, and that it may be conjectured to have been merely a name given to Edwy on account of his popularity among the peasants.* Such a popularity in the Saxon prince would naturally excite the jealousy of the Danes, who, however, sought the destruction of all the race. Edmund and Edward, the two infant sons of the deceased king, Edmund Ironside, were seized, and a feeling of shame, mingled perhaps with some fear of the popular odium, preventing him from murdering them in England, Canute sent them over sea to his ally and vassal, the king of Sweden, whom he requested to dispose of them in such a manner as should remove his uneasiness on their account. He meant that they should be murdered; but the Swedish king, moved by the innocence of the little children, instead of executing the horrid commission, sent them to the distant court of the king of Hungary, where they were affectionately and honourably entertained, beyond the reach of Canute. Of these two orphans Edmund died without issue, but Edward married a daughter of the German emperor, by whom he became father to Edgar Atheling, Christina, and Margaret. Edgar will be frequently mentioned in our subsequent pages. Margaret became the wife of Malcolm, King of Scotland, and through her the rights of the line of Alfred and Cerdic were transmitted to Malcolm's progeny, after the Norman conquest of England. There were still two princes whose claims to the crown might some day disquiet Canute, but they were out of his reach in Normandy. These were Edward and Alfred, the sons of King Ethelred, by Emma. Their uncle Richard, the Norman duke, at first sent an embassy to the Dane, demanding, on their behalf, the restitution of the kingdom; but though his power was great, he adopted no measures likely to induce Canute to a surrender or partition of the territories he was actually possessed of; and, very soon after, he entered into close and friendly negotiations with that enemy of his nephews, and even offered him *their* own mother and *his* sister in marriage. According to some historians, the first overtures to this unnatural marriage, which was followed by most unnatural consequences, proceeded from Canute. However this may be, the Dane wooed the widowed "Flower of Normandy;" and the heartless Emma, forgetful of the children she had borne, and only anxious to become again the wife of a king, readily gave her hand to the man who had caused the ruin and hastened the death of her husband Ethelred. In this extraordinary transaction an old chronicler is at a loss to decide whether the greater share of dishonour falls to Queen Emma or to her brother Duke Richard.* Having soon become the mother of another son, by Canute, this Norman woman neglected and despised her first-born; and those two princes being detained at a distance from England, became, by degrees, strangers to their own country, forgot its language and its manners, and grew up Normans instead of Saxons. The Danish dynasty of Canute was not destined to take root; but the circumstance just alluded to most essentially contributed to place a long line of Norman princes upon the throne of England.

Canute was not one that loved blood for the sake of bloodshedding. When he had disposed of all those who gave him fear or umbrage, he stayed his hand, and was praised, like so many other conquerors and tyrants, for his merciful forbearance. The Danish warriors insulted, robbed, and sorely oppressed the Saxons, and he himself wrung from them more "geld" than they had ever paid before; but by degrees Canute assumed a mild tone towards his new subjects, and partially succeeded in gaining their good-will. They followed him willingly to his foreign wars, of which there was no lack, for, besides that of England, Canute now held, or pretended to, the crowns of Denmark, Sweden, and Norway. In these distant wars the Saxons, who had not been able to defend themselves, fought most bravely under their own conqueror, for the enslaving of other nations. But this is a case of very common occurrence, both in ancient and modern history. Canute's last military expedition (A.D. 1017-19) was against the Cumbrians and Scots. Duncan, the regulus, or under-king of Cumbria, refused homage and allegiance to the Dane, on the ground that he was a usurper; and Malcolm, king of Scotland, equally maintained that the English throne belonged of right to the legitimate heir of King Ethelred. Had the powerful Duke of Normandy seconded these demonstrations in favour of his nephews Canute's crown might have been put in jeopardy; but the Cumbrians and Scots were left to themselves, and compelled to submit, in the face of a most formidable army which the Dane had collected.

These constant successes, and the enjoyment of

* Palgrave, Hist. ch. xiii. We hear of no "King of the Churls" either before or after Edwy. It certainly looks like a nickname.

* Malmsb.

peace which followed them, together with the sobering influence of increasing years, though he was yet in the prime of manhood, softened the conqueror's heart; and, though he continued to rule despotically, the latter part of his reign was marked with no acts of cruelty, and was probably, on the whole, a happier time than the English had known since the days of Alfred and Athelstane. He was cheerful and accessible to all his subjects, without distinction of race or nation. He took pleasure in old songs and ballads, of which both Danes and Saxons were passionately fond; he most liberally patronised the scalds, minstrels, and glee-men, the poets and musicians of the time, and occasionally wrote verses himself, which were orally circulated among the common people, and taken up and sung by them. He could scarcely have hit upon a surer road to popularity. A ballad of his composition continued long after to be a special favourite with the English peasantry. All of it is lost except the first verse, which has been preserved in the *Historia Eliensis*, or History of Ely. The interesting royal fragment is simply this:—

Merie sungen the munecheş binnen Ely,
Tha Cnut Ching reu there by,
Roweth, cnihtes, nær the land,
And here we thes munecheş soeng.

that is:—

Merrily sung the monks within Ely,
When Cnute king rowed thereby,—
Row, my knights, row near the land,
And hear we these monks' song.

The verses are said to have been suggested to him one day as he was rowing on the river Nenne, near Ely Minster, by hearing the sweet and solemn music of the monastic choir floating over the waters.* In his days of quiet the devotion of the times had also its full influence on the character of Canute. This son of an apostate Christian showed himself a zealous believer, a friend to the monks, a visitor and collector of relics, a founder of churches and monasteries. His soul was assailed with remorse for the blood he had shed and the other crimes he had committed; and, in the year 1030, he determined to make a pilgrimage to Rome. He started on his journey to the Holy City with a wallet on his back and a pilgrim's staff in his hand. He visited all the most celebrated churches on the road between the Low Countries and Rome, leaving at every one of them some proof of his liberality. According to a foreign chronicler, all the people on his way had reason to exclaim—"The blessing of God be upon the king of the English!" But no one tells us how dearly this munificence cost the English people. Returning from Rome, where he resided a considerable time, in company with other kings (there seems to have been a sort of royal and ecclesiastical congress held), he purchased, in the city of Pavia, the arm of St. Augustine, "the Great Doctor." This precious relic, for which he paid a hundred talents of gold and a hundred talents of silver, he afterwards presented to the church of Coventry;—an act of liberality by which, no doubt, he gained many friends and many prayers.

On re-crossing the Alps, Canute did not make his way direct to England, but went to his other kingdom of Denmark, where, it appears, he had still difficulties to settle, and where he remained some months. He, however, despatched the Abbot of Tavistock to England with a long letter of explanation, command, and advice, addressed to "Egelnoth the Metropolitan, to Archbishop Alfric, to all Bishops and Chiefs, and to all the nation of the English, both nobles and commoners, greeting." This curious letter, which appears to have been carefully preserved, and which is given entire by writers who lived near the time, begins with explaining the motives of his pilgrimage, and the nature of the sacred omnipotence of the Church of Rome. It then continues,—

"And be it known to you that, at the solemn festival of Easter, there was held a great assemblage of illustrious persons; to wit,—the Pope John, the Emperor Conrad, and the chiefs of all the nations from Mount Garganus to the neighbouring sea. They all received me with distinction, and honoured me with rich presents, giving me vases of gold and vessels of silver, and stuffs and garments of great price. I discoursed with the Lord Pope, the Lord Emperor, and the other princes, on the grievances of my people, English as well as Danes. I endeavoured to obtain for my people justice and security in their journeys to Rome; and, above all, that they might not henceforth be delayed on the road by the shutting up of the mountain passes, the erecting of barriers, and the exaction of heavy tolls. My demands were granted both by the Emperor and King Rudolf, who are masters of most of the passes; and it was enacted that all my men, as well merchants as pilgrims, should go to Rome and return in full security, without being detained at the barriers, or forced to pay unlawful tolls. I also complained to the Lord Pope that such enormous sums had been extorted up to this day from my archbishops, when, according to custom, they went to the apostolic see to obtain the pallium; and a decree was forthwith made that this grievance likewise should cease. Wherefore I return sincere thanks to God that I have successfully done all that I intended to do, and have fully satisfied all my wishes. And now, therefore, be it known to you all that I have dedicated my life to God, to govern my kingdoms with justice, and to observe the right in all things. If, in the time that is passed, and in the violence and carelessness of youth, I have violated justice, it is my intention, by the help of God, to make full compensation. Therefore I beg and command those unto whom I have entrusted the government, as they wish to preserve my good will, and save their own souls, to do no injustice either to rich or poor. Let those who are noble, and those who are not, equally obtain their rights, according to the

* The meaning of the old English "merry," and "merrily," it is to be remembered, was different from that which we now attach to the words. A "merry" song was merely a sweet or touching melody, and might be plaintive as well as gay.

laws, from which no deviation shall be allowed, either from fear of me, or through favour to the powerful, or for the purpose of supplying my treasury. *I want no money raised by injustice.*" The last clause of this remarkable and characteristic epistle had reference to the clergy. "I entreat and order you all, the bishops, sheriffs, and officers of my kingdom of England, by the faith which you owe to God and to me, so to take measures that before my return among you all our debts to the church be paid up; to wit, the plough alms, the tithes on cattle of the present year, the Peter-pence due by each house in all towns and villages, the tithes of fruit in the middle of August, and the kirk-shot at the feast of St. Martin to the parish church. And if, at my return, these dues are not wholly discharged, I will punish the delinquents according to the rigour of the laws, and without any grace. So fare ye well." *

It does not clearly appear whether the old writers refer the following often-repeated incident to a period preceding or one subsequent to this Roman pilgrimage. When at the height of his power, and when all things seemed to bend to his lordly will (so goes the story), Canute, disgusted one day with the extravagant flatteries of his courtiers, determined to read them a practical lesson. He caused his throne to be placed on the verge of the sands on the sea-shore as the tide was rolling in with its resistless might, and, seating himself, he addressed the ocean, and said,—"Ocean! the land on which I sit is mine, and thou art a part of my dominion—therefore rise not—obey my commands, nor presume to wet the edge of my robe." He sate for some time as if expecting obedience, but the sea rolled on in its immutable course; succeeding waves broke nearer and nearer to his feet, till at length the skirts of his garment and his legs were bathed by the waters. Then, turning to his courtiers and captains, Canute said,—"Confess ye now how frivolous and vain is the might of an earthly king compared to that Great Power who rules the elements, and can say unto the ocean, 'Thus far shalt thou go, and no farther.'" The chroniclers conclude the apologue by adding that he immediately took off his crown, and depositing it in the cathedral of Winchester, never wore it again.

CANUTE REPROVING HIS FLATTERERS.—Smirke

This great Danish sovereign died in A.D. 1035, at Shaftesbury, about three years after his return from Rome, and was buried at Winchester. The churches and abbeys he erected have long since disappeared, or their fragments have been imbedded in later edifices erected on their sites; but the great public work called the *King's Delf*, a causeway connecting Peterborough and Ramsey, and carried through the marshes by Canute's command, is still serviceable.

On his demise there was the usual difficulty and contention respecting the succession. Canute left but one legitimate son, Hardicanute, whom he had by Ethelred's widow, the Lady Emma of Normandy. He had two illegitimate sons, Sweyn and Harold. In royal families bastardy was none, or a very slight objection in those days; but, according to the contemporary writers, it was the prevalent belief, or popular scandal, that these two young men were not the children of Canute, even illegitimately, but were imposed upon him as such by his acknowledged concubine Alfgiva, daughter of the ealderman of Southampton, who, according to this gossip, knew full well that Sweyn was the son of a priest by another woman, and Harold the offspring of a cobbler and his wife. Whoever were their fathers and mothers, it is certain that Canute intended that his dominions should be divided among the three young men, and this without any apparent prejudice in favour of legitimacy; for Harold, and not Hardicanute (the lawful son), was to have England, which was esteemed by far the best portion. Denmark was to fall to Hardicanute, and Norway to Sweyn. Both these princes were in the north of Europe, and apparently in possession of power there, when Canute died. The powerful Earl Godwin, and the Saxons of the south generally, wished rather to choose for king of England either one of the sons of Ethelred, who were still in Normandy, or Hardicanute, the son of Emma, who was at least connected with the old Saxon line. But Earl Leofric of Mercia, with the thanes north of the Thames, and all the Danes, supported the claims of the illegitimate Harold; and when the influential city of London took this side, the cause of Hardicanute seemed almost hopeless. But still all the men of the south and the great Earl Godwin adhered to the latter, and a civil war was imminent (to escape the horrors of which many families had already fled to the morasses and forests), when it was wisely determined to effect a compromise by means of the witenagemot. This assembly met at Oxford, and there decided that Harold should have all the provinces north of the Thames, with London for his capital, while all the country south of that river should remain to his real or fictitious half-brother Hardicanute.

Hardicanute, showing no anxiety for his dominions in England, lingered in Denmark, where the habits of the Scandinavian chiefs, and their hard drinking, were to his taste; but his mother, Emma, and Earl Godwin governed in the south on his behalf, and held a court at Winchester. Harold, however, who saw his superiority over his absent half-brother, took his measures for attaching the provinces of the south to his dominions; and two fruitless invasions from Normandy only tended to increase his power and facilitate that aggrandizement.

Soon after the news of Canute's death reached Normandy, Edward, the eldest of the surviving sons of Ethelred by Emma, and who eventually became king of England under the title of Edward the Confessor, made sail for England with a few ships, and landed at Southampton in the intention of claiming the crown. He threw himself in the midst of his mother's retainers, and was within a few miles of her residence at Winchester. But Emma had no affection for her children by Ethelred; she was at the moment making every exertion to secure the English throne for her son by Canute, and, instead of aiding Edward, she set the whole country in hostile array against him. He escaped with some difficulty from a formidable force, and fled back to Normandy, determined, it is said, never again to touch the soil of his fathers.

The second invasion from Normandy was attended with more tragical results, and part of the history of it is enveloped in an impenetrable mystery.

An affectionate letter,* purporting to be written by the queen mother, Emma, was conveyed to her sons Edward and Alfred, reproaching them with their apathy, and urging that one of them, at least, should return to England and assert his right against the tyrant Harold. This letter is pronounced a forgery by the old writer who preserves it; but those who are disposed to take the darkest view of Emma's character may object, that this writer was a paid encomiast of that queen's (and paid by her living self), and therefore not likely to confess her guilty of being a participator in her own son's murder, even if such were the fact. The same authority, indeed, even praises her for her ill-assorted, shameful marriage with Canute, which undeniably alienated her from her children by the former union. For ourselves, although she did not escape the strong suspicion of her contemporaries any more than Earl Godwin, who was then in close alliance with her, we rather incline to the belief that the letter was forged by the order of Harold; though, again, there is a possibility that it may have been actually the product of the queen, who may have meant no harm to her son, and that the harm he suffered may have fallen upon him through Godwin, on that chief's seeing how he came attended. However this may be, Alfred, the younger of the two brothers, accepted the invitation. The instructions of Emma's letter were to come without any armament;† but he raised a considerable force (*milites non parvi numeri*)‡ in Normandy and Boulogne. When he appeared off Sandwich, there was a far superior force there, which rendered his landing hopeless. He therefore bore round the

North Foreland, and disembarked "opposite to Canterbury," probably about Herne Bay, between the Triculvers and the Isle of Sheppey. Having advanced some distance up the country without any opposition, he was met by Earl Godwin, who is said to have sworn faith to him, and to have undertaken to conduct him to his mother Emma. Avoiding London, where the party of Harold was predominant, they marched to Guildford, where Godwin billeted the strangers, in small parties of tens and scores in different houses of the town. There was plenty of meat and drink prepared in every lodging; and Earl Godwin, taking his leave for the night, promised his dutiful attendance on Alfred for the following morning. Tired with the day's journey, and filled with meat and wine, the separated company went to bed, suspecting no wrong; but in the dead of night, when disarmed and buried in sleep, they were suddenly set upon by King Harold's forces, who seized and bound them all with chains and gives. On the following morning they were ranged in a line before the executioners. There are said to have been 600 victims, and, with the exception of every tenth man, they were all barbarously tortured and massacred. Prince Alfred was reserved for a still more cruel fate. He was hurried away to London, where, it should seem, Harold personally insulted his misfortunes; and from London he was sent to the Isle of Ely, in the heart of the country of the Danes. He made the sad journey mounted on a wretched horse, naked, and with his feet tied beneath the animal's belly. At Ely he was arraigned before a mock court of Danish miscreants, as a disturber of the country's peace, and was condemned to lose his eyes. His eyes were instantly torn out by main force, and he died a few days after in exquisite anguish. Some believe that Earl Godwin was guilty of betraying, or at least deserting, the prince after he had landed in England, without having premeditated treachery in inviting him over; and they say his change of sentiment took place the instant he saw that Alfred, instead of coming alone to throw himself on the affections of the Saxon people, had surrounded himself with a host of ambitious foreigners, all eager to share in the wealth and honours of the land. Henry of Huntingdon, a writer of the twelfth century, supports this not irrational view of the case, and says that Godwin told his Saxon followers that Alfred came escorted by too many Normans,—that he had promised these Normans rich possessions in England,—and that it would be an act of imprudence in them, the Saxons, to permit this race of foreigners, known through the world for their audacity and cunning, to gain a footing in England. The whole life of the great Earl abounds in sudden resolutions and changes; nor did he ever hesitate at bloodshed; but without going into a discussion which would fill many pages, and leave us in uncertainty at last, we will quit this horrid tragedy, of the truth of which there is no reason to doubt, by confessing that the motives of the parties concerned, and the share of guilt which each had in it, cannot be established from the accounts of the old chroniclers, who hold very different language, and contradict each other. Shortly after the murder of Alfred, Emma was either sent out of England by Harold, or retired a voluntary exile. It is to be remarked that she did not fix her residence in Normandy, where her son Edward, brother of Alfred, was living, but went to the court of Baldwin, Earl of Flanders.

HAROLD had now little difficulty in getting himself proclaimed "full king" over all the island. The election, indeed, was not sanctioned by legislative authority; but this authority, always fluctuating and uncertain, was at present almost worthless. A more important opposition was that offered by the church, in whose ranks the Saxons were far more numerous than the Danes, or priests of Danish descent; and in all these contentions the two hostile races must be considered, and not merely the quarrels or ambition of the rival princes. The question at issue was, whether the Danes or the Saxons should have the upper land. Ethelnoth, the Archbishop of Canterbury, who was a Saxon, refused to perform the ceremonies of the coronation. Taking the crown and sceptre, which it appears had been entrusted to his charge by Canute, he laid them on the altar, and said, "Harold! I will neither give them to thee, nor prevent thee from taking the ensigns of royalty; but I will not bless thee, nor shall any bishop consecrate thee on the throne." It is said that, on this, like a modern conqueror, the Dane put the crown on his head with his own hands. According to some accounts he subsequently won over the Archbishop, and was solemnly crowned. Other authorities, however, assert that he was never crowned at all,—that, out of spite to the Archbishop, he showed an open contempt for the Christian religion, absenting himself from all places of worship, and uncoupling his hounds, or calling for meat and wine at the hours when the faithful were summoned to mass and prayer. His chief amusement was hunting; and, from the fleetness with which he could follow the game on foot, he acquired the name of "Harold Harefoot." Little more is known about him, except that he died after a short reign of four years, in A.D. 1040, and was buried at Westminster.

HARDICANUTE, his half-brother, was at Bruges, and on the point of invading England, when Harold died. After long delays in Denmark, he listened to the urgent calls of his exiled mother, the still stirring and ambitious Emma; and, leaving a greater force ready at the mouth of the Baltic, he sailed to Flanders with nine ships to consult his parent. He had been but a short time at Bruges when a deputation of English and Danish thanes arrived there to invite him to ascend the most brilliant of his father's thrones in peace. The two great factions in England had come to this agreement, but, according to the chroniclers, they were soon made to repent of it by the exactions and rapacity of Hardicanute.

Relying more on the Danes, among whom he had lived so long, than on the English, and being averse to part with the companions of his revels and drinking-bouts, he brought with him a great number of Danish chiefs and courtiers, and retained an expensive Danish army and navy. This obliged him to have frequent recourse to "Danegelds," the arbitrary levying of which by his "Huscarles," or household troops, who were all Danes, caused frequent insurrections or commotions. The people of Worcester resisted the Huscarles with arms in their hands, and slew Feader and Turstane, two of the king's collectors. In revenge for this contempt, that city was burnt to the ground, a great part of the surrounding country laid desolate, and the goods of the citizens put to the spoil "by such power of lords and men-of-war as the king sent against them." It should appear that not even the church was exempted from these oppressive levies of Dane-geld, for a monkish writer complains that the clergy were forced to sell the very chalices from the altar in order to pay their assessments.

On his first arriving in England, Hardicanute showed his horror of Prince Alfred's murder, and his revenge for the injury done by Harold to himself and his relatives, in a truly barbarous manner. By his order, the body of Harold was dug up from the grave; its head was struck off, and then both body and head were thrown into the Thames. To increase the dramatic interest of the story, some of the old writers, who maintain that the great earl had murdered Alfred to serve Harold, say that Godwin was obliged to assist at the disinterment and decapitation of the corpse, the mutilated remains of which were soon after drawn out of the river by some Danish fishermen, who secretly interred them in the churchyard of St. Clement Danes, "without Temble-bar at London." Earl Godwin, indeed, a very short time after, was formally accused of Alfred's murder; but he cleared himself, in law, by his own oath, and the oaths of many of his peers; and a rich and splendid present is generally supposed to have set the question at rest between him and Hardicanute, though it failed to acquit him in popular opinion. This present was a ship of the first class, covered with gilded metal, and bearing a figure-head in solid gold: the crew, which formed an intrinsic part of the gift, were four score picked warriors, and each warrior was furnished with dress and appointments of the most costly description—a gilded helmet was on his head, a triple hauberk on his body, a sword with a hilt of gold hung by his side, a Danish battle-axe, damasked with silver, was on his shoulder, a gold-studded shield on his left arm, and in his right hand a gilded *ategar*.*

During the remainder of Hardicanute's short reign, Earl Godwin, and Emma the queen-mother, who were again in friendly alliance, divided nearly all the authority of government between them, leaving the king to the tranquil enjoyment of the things he most prized in life—his banquets, which were spread four times a day, and his carousals at night. From many incidental passages in the old writers, we should conclude that the Saxons themselves were sufficiently addicted to drinking and the pleasures of the table, and required no instructors in those particulars; yet it is pretty generally stated that hard drinking became fashionable under the Danes; and more than one chronicler laments that Englishmen learned from the example of Hardicanute "their excessive gourmandizing and unmeasurable filling of their bellies with meats and drinks."

This king's death was in keeping with the tenor of his life. When he had reigned two years all but ten days, he took part, with his usual zest, in the marriage feast of one of his Danish thanes, which was held at Lambeth, or, more probably, at Clapham.* At a late hour of the night, as he stood up to pledge that jovial company, he suddenly fell down speechless with the wine-cup in his hand: he was removed to an inner chamber, but he spoke no more; and thus the last Danish king in England died drunk. He was buried in the church of Winchester, near his father Canute.

Silver Coins of Edward the Confessor.—From Specimens in the British Museum.

Edward the Confessor. Hardicanute was scarcely in his grave when his half-brother Edward, who was many years his senior, ascended the throne (A.D. 1042) with no opposition, except such as he found from his own fears and scruples, which, had he been left to himself, would probably have induced him to prefer a monastery or some other quiet retirement in Normandy. During his very brief reign, Hardicanute had recalled the exile to England, had received him with honour and affection, granted him a handsome allowance, and even proposed, it is said, to associate him in his government. Edward was, therefore, at hand, and in a favourable position at the moment of crisis; nor, according to the *modern* laws of hereditary succession, could any one have established so good a right; for his half-nephew, Edward, who was still far away in Hungary, was only illegitimately descended from the royal line of Cerdic and Alfred, his father, Edmund Ironside, though older than Edward, being a natural son of their common father Ethelred. But, in truth, rules of succession had little to do with the settlement of the crown, which

* The same scythe-shaped weapon as the Moorish "assagay," the Turkish "yataghan," &c. It was a common weapon with the Danes, and is still so in the East.

* The name of the bride's father, in whose house the feast is supposed to have been held, was Osgod Clapa; and *Clapa-ham*, the *hame* or *home* of Clapa, is taken as the etymology of our suburban village.—*Palgrave, Hist.* ch. xiii.

was effected by a variety of other and more potent agencies. The connexion between the Danish and English crowns was evidently breaking off; there was a prospect that the two parties in England would soon be left to decide their contest without any intervention from Denmark; for some time the Saxon party had been gaining ground, and, before Hardicanute's death, formidable associations had been made, and more than one successful battle fought against the Danes. On their side, the Danes, having no descendant of the great Canute around whom to rally, became less vehement for the expulsion of the Saxon line, while many of them settled in the south of the island were won over by the reputed virtue and sanctity of Edward. If we may judge by the uncertain light of some of the chronicles, many leading Danes quitted England on Hardicanute's decease; and it seems quite certain that when the nobles and prelates of the Saxons (were there not Danes among these?) assembled in London, with the resolution of electing Edward, they encountered no opposition from any Danish faction. But the great Earl Godwin, the still suspected murderer of the new king's brother, Alfred, had by far the greatest share in Edward's elevation. This veteran politician, of an age considered barbarous, and of a race (the Saxon) generally noted rather for stupidity and dulness, than for acuteness and adroitness, trimmed his sails according to the winds that predominated, with a degree of skill and remorselessness which would stand a comparison with the manœuvres of the most celebrated political intriguers of the most modern and civilized times. In all the struggles that had taken place since the death of Canute he had changed sides with astonishing facility and rapidity,—going back more than once to the party he had deserted, then changing again, and always causing the faction he embraced to triumph just so long as he adhered to it, and no longer. Changes, ruinous to others, only brought him an accession of strength. At the death of Hardicanute, he was earl of all Wessex and Kent; and by his alliances and intrigues, he controlled nearly the whole of the southern and more Saxon part of England. His abilities were proved by the station he had attained; for he had begun life as a cow-herd. He was a fluent speaker; but his eloquence, no doubt, owed much of its faculty of conveying conviction to the power or material means he had always at hand to enforce his arguments. When he rose in the assembly of thanes and bishops, and gave it as his opinion that Edward the Atheling, the only surviving son of Ethelred, should be their king, there were but very few dissentient voices; and the earl carefully marked the weak minority, who seem all to have been Saxons, and drove them into exile shortly after. It is pretty generally stated, that his relation, William, Duke of Normandy (afterwards the Conqueror), materially aided Edward by his influence, having firmly announced to the Saxons, that if they failed in their duty to the sons of Emma, they should feel the weight of his vengeance; but we more than doubt the authenticity of this fact, from the simple circumstances of Duke William's being only fifteen years old at the time, and his states being in most lamentable confusion and anarchy, pressed from without by the French king, and troubled within by factious nobles, who all wished to take advantage of his youth and inexperience.

The case, perhaps, is not very rare, but it must always be a painful and perplexing one. Edward hated the man who was serving him; and while Godwin was placing him on the throne, he could not detach his eyes from the bloody grave to which, in his conviction, the earl had sent his brother Alfred. Godwin was perfectly well aware of these feelings, and, like a practised politician, before he stirred in Edward's cause, and when the fate of that prince, even to his life or death, was in his hands, he made such stipulations as were best calculated to secure him against their effects. He obtained an extension of territories, honours, and commands for himself and his sons—a solemn assurance that the past was forgiven, and, as a pledge for future affection and family union, he made Edward consent to marry his daughter. The fair Editha, the daughter of the fortunate earl, became queen of England; but the heart was not to be controlled, and Edward was never a husband to her. Yet, from contemporary accounts, Editha was deserving of love, and possessed of such a union of good qualities as ought to have removed the deep-rooted antipathies of the king to herself and her race. Her person was beautiful; her manners graceful; her disposition cheerful, meek, pious, and generous, without a taint of her father's or brothers' pride and arrogance. Her mental accomplishments far surpassed the standard of that age; she was fond of reading, and had read many books. Ingulphus, the monk of Croyland, who was her contemporary and personal acquaintance, speaks of her with a homely and subdued enthusiasm that is singularly touching. He says she sprung from Godwin as the rose springs from the thorn. "I have very often seen her," he continues, "in my boyhood, when I used to go to visit my father, who was employed about the court. Often did I meet her as I came from school, and then she questioned me about my studies and my verses; and, willingly passing from grammar to logic, she would catch me in the subtleties of argument. She always gave me two or three pieces of money, which were counted to me by her hand-maiden, and then *sent me to the royal larder to refresh myself.*"

If Edward neglected, and afterwards persecuted his wife, he behaved in a still harsher and more summary manner to his mother Emma, who, though she has few claims on our sympathy, was, in spite of all her faults, entitled to some consideration from him. But he could not forgive past injuries—he could not forget, that, while she lavished her affections and ill-gotten treasures on her children by Canute,

she had left him and his brother to languish in poverty in Normandy, where they were forced to eat the bitter bread of other people; and he seems never to have relieved her from the horrid suspicion of having had part in Alfred's murder. These feelings were probably exasperated by her refusing to advance him money at a moment of need, just before, or at the date of his coronation. Shortly after his coronation he held a council at Gloucester, whence, accompanied by Earls Godwin, Leofric, and Siward, he hurried to Winchester, where Emma had again established a sort of court, seized her treasures, and all the cattle, the corn, and the forage on the lands which she possessed as a dower, and behaved otherwise to her with great harshness. Some say she was committed to close custody in the abbey of Wearwell; but, according to the more generally received account, she was permitted to retain her lands, and to reside at large at Winchester, where, it appears, she died in 1052, the tenth year of Edward's reign. We omit the story of her alleged amours with Alwin, bishop of Winchester, and her exculpating herself by walking unscathed with naked feet over nine red-hot plough-shares, as rather a fabulous legend, than belonging to real history.

In the second year of Edward's reign (A.D. 1043), a faint demonstration to re-establish the Scandinavian supremacy in England was made by Magnus, king of Norway and Denmark; but the Saxons assembled a great fleet at Sandwich; the Danes in the land remained quiet, and, his last hopes expiring, Magnus was soon induced to declare that he thought it "right and most convenient" that he should let Edward enjoy his crown, and content himself with the kingdoms which God had given him. But though undisturbed by foreign invasions or the internal wars of a competitor for the crown, Edward was little more than a king in name. This abject condition arose in part, but certainly not wholly, from his easy, pacific disposition; for he not unfrequently showed himself capable of energy, and firm and sudden decisions; and although superstitious and monk-ridden, he was, when roused, neither deficient in talent nor in moral courage. A wider and deeper spring, that sapped the royal authority, was the enormous power Godwin and other earls had possessed themselves of before his accession; and this power, be it remembered, he himself was obliged to augment before he could put his foot on the lowest step of the throne. When he had kept his promises with the "Great Earl"—and he could not possibly evade them—what with the territories and commands of Godwin, and of his six sons, Harold, Sweyn, Wulnoth, Tostig, Gurth, and Leofwine, the whole of the south of England, from Lincolnshire to the end of Cornwall, was in the hands of one family. Nor had Edward's authority a better basis elsewhere, for the whole of the north was unequally divided between Leofric and the greater Earl Siward, whose dominions extended from the Humber to the Scottish border. These earls possessed all that was valuable in sovereignty within the territories they held. They appointed their own judges, received fines, and levied what troops they chose. The chief security of the king lay in the clashing interests and jealousies of these mighty vassals; and, notwithstanding the remark of a great writer,* that this policy of balancing opposite parties required a more steady hand to manage it than that of Edward, it appears to us that he for some time acquitted himself skilfully in this particular. As the king endeared himself to his people by reducing taxation, and removing the odious Dane-geld altogether,—by reviving the old Saxon laws, and administering them with justice and promptitude;—as he gained their reverence by his mild virtues, and still more by his ascetic devotion, which eventually caused his canonization, he might have been enabled to curb the family of Godwin and the rest, and raise his depressed throne by means of the popular will and affection; but, unfortunately, there were circumstances interwoven which neutralized Edward's advantages, and gave the favourable colour of nationality and patriotism to the cause of Godwin, whenever he chose to quarrel with the king. It was perfectly natural, and it would have been as excusable as natural, if the imprudence of a king ever admitted of an excuse, that Edward should have an affection for the Normans, among whom the best years of his life had been passed, and who gave him food and shelter when abandoned by all the rest of the world. He was only thirteen years old when he was first sent into Normandy; he was somewhat past forty when he ascended the English throne; so that, for twenty-seven years, commencing with a period when the young mind is not formed, but ductile and most susceptible of impressions, he had been accustomed to foreign manners and habits, and to convey all his thoughts and feelings through the medium of a foreign language. He was accused of a predilection for the French, or "Romance," which by this time had superseded their Scandinavian dialect, and became the vernacular language of the Normans; but it is more than probable he had forgotten his Saxon. It is not at the mature age of forty that a man can shake off all his previous tastes, habits, and connexions, and form new ones. Thus the king, as a matter of course, preferred the society of the Normans to that of his own subjects; and, whatever may have been the relative civilization of the two kindred people half a century before, it is quite certain that the Danish wars, from the time of Ethelred downwards, had caused the Saxons to retrograde, while it is probable the Normans had made considerable advances in refinement in the same interval. Relying on Edward's gratitude and friendship, several Normans came over with him when he was invited to England by Hardicanute: this number was augmented after his accession to the throne; and as the king provided for them all, or gave them constant entertainment

* Hume, Hist.

at his court, fresh adventurers continued to cross the Channel from time to time. It should appear it was chiefly in the church that Edward provided for his foreign favourites. Robert, a Norman, and, like most of his race, a personal enemy to Earl Godwin, was promoted to be Archbishop of Canterbury and primate of all England; Ulf and William, two other Normans, were made bishops of Dorchester and London; and crosiers and abbots' staffs were liberally distributed to the king's exotic chaplains and house-clerks, who are said to have closed all the avenues of access to his person and favour against the English-born. Those Saxon nobles who yet hoped to prosper at court learned to speak French, and imitated the dress, fashions, and manner of living of the Normans. Edward adopted, in all documents and charters, the hand-writing of the Normans, which he thought handsomer than that of the English: he introduced the use of the "great seal," which he appended to his parchments, in addition to the simple mark of the cross, which had been used by the Anglo-Saxon kings; and as his chancellor, secretaries of state, and legal advisers were all foreigners, and, no doubt, like the natives of France of all ages, singularly neglectful of the tongue of the people among whom they were settled, the English lawyers were obliged to study French, and to employ a foreign language in their deeds and papers.* Even in those rude ages fashion had her influence and her votaries. The study of the French language, to the neglect of the Saxon,† became very general, and the rich, the young, and the gay of both sexes were not satisfied unless their tunics, their *chaussés*, their streamers, and mufflers were cut after the latest Norman pattern. Not one of these things was trifling in its influence—united, their effect must have been most important; and it seems to us that historians in general have not sufficiently borne them in mind as a prelude to the great drama of the Norman conquest.

All this, however, was distasteful to the great body of the Saxon people, and highly irritating to Earl Godwin, who is said to have exacted an express and solemn promise from the king not to inundate the land with Normans, ere he consented to raise him to the throne. The earl could scarcely take up a more popular ground; and he made his more private wrongs,—the king's treatment of his daughter, and disinclination to the society of himself and his sons,—all close and revolve round this centre. Even personally the sympathy of the people went with him. "Is it astonishing," they said, "that the author and supporter of Edward's reign should be wroth to see *new* men, of a foreign nation, preferred to himself?" ‡

In 1044 a crime committed by a member of his family somewhat clouded Godwin's popularity. Sweyn, the earl's second son, and a married man, violated an abbess, and was exiled by the king; for this, of all others, was the crime Edward was least likely to overlook. After keeping the seas for some time as a pirate, Sweyn returned to England on the promise of a royal pardon. Some delay occurred in passing this act of grace; and it is said that Beorn, his cousin, and even Harold, the brother of Sweyn, pleaded strongly against him at court. The fury of the outlaw knew no bounds, but pretending to be reconciled with his cousin Beorn, he won his confidence got possession of his person, and then caused him to be murdered. In spite of this accumulated guilt Edward was fain to grant a pardon to the son of the powerful earl, and Sweyn, though he had rendered himself odious, and injured the popularity of his family, was restored to his government.

But in 1051 an event occurred which exasperated the whole nation against the Normans, and gave Godwin the opportunity of recovering all his reputation and influence with the Saxon people. Among the many foreigners that came over to visit the king was Eustace, Count of Boulogne, who had married the Lady Goda, a daughter of Ethelred, and sister to Edward. This Eustace was a prince of considerable power, and more pretension. He governed hereditarily, under the supremacy of the French crown, the city of Boulogne and the contiguous territory on the shores of the Channel; and as a sign of his dignity as chief of a maritime country, when he armed for war he attached two long aigrettes, made of whalebone, to his helmet. This loving brother-in-law, with rather a numerous retinue of warriors and men-at-arms, was hospitably entertained at the court of Edward, where he saw Frenchmen and Normans, and everything that was French and foreign, so completely in the ascendant, that he was led to despise the Saxons as a people already conquered. On his return homewards Eustace slept one night at Canterbury. The next morning he continued his route for Dover, and when he was within a mile of that town he ordered a halt, left his travelling palfrey, and mounted his war-horse, which a page led in his right hand. He also put on his coat of mail: all his people did the same; and in this warlike harness they entered Dover. The foreigners marched insolently through the town, choosing the best houses in which to pass the night, and taking free quarters on the citizens without asking permission, which was contrary to the laws and customs of the Saxons. One of the townsmen boldly repelled from his threshold a retainer who pretended to take up his quarters in his house. The stranger drew his sword, and wounded the Englishman,—the Englishman armed in haste, and he, or one of his house, slew the Frenchman. At this intelligence Count Eustace and all his troop mounted on horseback, and, surrounding the house of the Englishman, some of them forced their way in, and murdered him on his own hearth-stone. This done, they galloped through the streets with their naked

* Ingulf.

† According to Ingulf, French came to be considered as the only language worthy of a gentleman.

‡ Malmsb.

swords in their hands, striking men and women, and crushing several children under their horses' hoofs. This outrage roused the spirit of the burghers, who armed themselves with such weapons as they had, and met the mailed warriors in a mass. After a fierce conflict, in which nineteen of the foreigners were slain and many more wounded, Eustace, with the rest, being unable to reach the port and embark, retreated out of Dover, and then galloped with loose rein towards Gloucester to lay his complaints before the king. Edward, who was, as usual, surrounded by his Norman favourites, gave his peace to Eustace and his companions, and believing, on the simple assertion of his brother-in-law, that the inhabitants of Dover were in the wrong, and had begun the affray, he sent immediately to Earl Godwin, in whose government the city lay. "Set out forthwith," said the king's order,* "go and chastise with a military execution those who attack my relations with the sword, and trouble the peace of the country." "It ill becomes you," replied Godwin, "to condemn, without a hearing, the men whom it is your duty to protect." † The circumstances of the fight at Dover were now known all over the country: the assault evidently had begun by a Frenchman's daring to violate the sanctity of an Englishman's house, and, right or wrong, the Saxon people would naturally espouse the cause of their countrymen. Instead, therefore, of chastising the burghers, the Earl sided with them. Before proceeding to extremities Godwin proposed that, instead of exercising that indiscriminate vengeance on all the inhabitants, which was implied by a military execution, the magistrates of Dover should be cited in a legal manner to appear before the king and the royal judges, to give an account of their conduct. It should seem that, transported by the indignation of his brother-in-law the Earl Eustace, and confounded by the clamours of his Norman favourites, Edward would not listen to this just and reasonable proposition, but summoned Godwin to appear before his *foreign* court at Gloucester; and on his hesitating to put himself in so much jeopardy, threatened him and his family with banishment and confiscation. Then the great earl armed, and in so doing, though some of the chroniclers assert it was only to redress the popular grievances, and to make an appeal to the English against the courtiers from beyond sea, and that nothing was farther from his thoughts than to offer insult or violence to the king of his own creation, we are far from being convinced of the entire purity of his motives or the moderation of his objects.

Godwin, who ruled the country south of the Thames, from one end to the other, gathered his forces together, and was joined by a large body of the people, who voluntarily took up arms. Harold, the eldest of his sons, collected many men all along the eastern coast between the Thames and the city of Boston; and Sweyn, his second son, whose guilt was forgotten in the popular excitement, arrayed his soldiers, and formed a patriotic association among the Saxons who dwelt on the banks of the Severn and along the frontiers of Wales. These three columns soon concentrated near Gloucester, then the royal residence; and, with means adequate to enforce his wish, Godwin demanded that the Count Eustace, his companions, and many other Normans and Frenchmen, should be given up to the justice of the nation. Edward, knowing he was wholly at the mercy of his irritated father-in-law, was still firm. To gain time he opened a negotiation; and so much was he still esteemed by the people, that Godwin was obliged to save appearances, and to grant him that delay which, for a while, wholly overcast the earl's fortunes. Edward had secured the good-will of Godwin's great rivals,—Siward, Earl of Northumbria, and Leofric, Earl of Mercia: to these chiefs he now applied for protection, summoning to his aid at the same time Ranulf or Ralph, a Norman knight, whom he had made Earl of Worcestershire. When these forces united and marched to the king's rescue, they were equal or superior in number to those of Godwin, who had thus lost his moment. The people, however, had improved in wisdom; and on the two armies coming in front of each other, it was presently seen, by their respective leaders, that old animosities had in a great measure died away,—that the Anglo-Danes from the north were by no means anxious to engage their brethren of the south for the cause of Normans, and men equally alien to them both,—and that the Saxons of the south were averse to shedding the blood of the Anglo-Danes of the north. The whispers of individual ambition,—the mutterings of mutual revenge,—the aspirations of the great, were mute, for once, at the loud and universal voice of the people. An armistice was concluded between the king and Godwin, and it was agreed to refer all differences to an assembly of the legislature, to be held at London in the following autumn. Hostages and oaths were exchanged—both king and earl swearing "God's peace and full friendship" for one another. Edward employed the interval between the armistice and the meeting of the witenagemot in publishing a ban for the levying of a royal army all over the kingdom, in engaging troops both foreign and domestic, and in strengthening himself by all the means he could command. In the same time the forces of Harold, which consisted in chief part of burghers and yeomen, who had armed under the first excitement of a popular quarrel, and who had neither pay nor quarters in the field, dwindled rapidly away. According to the Saxon Chronicle, the king's army, which was cantoned within and about London, soon became the most numerous that had been seen in this reign. The chief, and many of the subordinate commands in it, were given to Norman favourites, who thirsted for the blood of Earl Godwin. At the appointed time the earl and his sons were sum-

* Chron. Sax. † Malmsb.

moned to appear before the witenagemot without any military escort whatsoever; and that, too, in the midst of a most formidable army and of deadly enemies, who would not have spared their persons, even if the king and the legislative assembly had been that way inclined. Godwin, who before now had frequently both suffered and practised treachery, refused to attend the assembly unless proper securities were given that he and his sons should go thither and depart thence in safety. This reasonable demand was repeated, and twice refused; and then Edward and the great council pronounced a sentence of banishment, decreeing that the earl and all his family should quit the land for ever within five days. There was no appeal; and Godwin and his sons, who it appears had marched to Southwark, on finding that even the small force they had brought with them was thinned by hourly desertion, fled by night for their lives. The sudden fall of this great family confounded and stupified the popular mind. "Wonderful would it have been thought," says the Saxon Chronicle, "if any one had said before that matters would come to such a pass." Before the expiration of the five days' grace a troop of horsemen were sent to pursue and seize the earl and his family; but these soldiers were wholly or chiefly Saxons, and either could not, or would not overtake them. Godwin, with his wife and his three sons, Sweyn, Tostig, and Gurth, and a ship well stored with money and treasures, embarked on the east coast, and sailed to Flanders, where he was well received by Earl Baldwin: Harold and his brother Leofwin fled westward, and embarking at Bristol, crossed the sea to Ireland.

Their property, their broad lands, and houses, with everything upon them and within them were confiscated,—their governments and honours distributed, in part, among foreigners, and scarcely a trace was left in the country of the warlike earl or his bold sons. But a fair daughter of that house remained,—Editha was still queen of England,—and on *her* Edward determined to pour out the last vial of his wrath, and complete his vengeance on the obnoxious race that had given him the throne. He seized her dower,—he took from her her jewels and her money, "even to the uttermost farthing,"—and allowing her only the attendance of one maiden, he closely confined his virgin wife in the monastery of Wherwell, of which one of his sisters was Lady Abbess,—and in this cheerless captivity she, in the language of one of the old chroniclers, "in tears and prayers expected the day of her release and comfort."

Although the whole of his thoroughly unnatural conduct to his beautiful and amiable wife is made matter of monkish laudation and jubilee, this vindictiveness does not savour of sanctity; and if he made use of the excuse for "his unprincely and unspouse-like usage," which some have attributed to him,—namely, "that it suited not that Editha should live in comfort when her parents and her brethren were banished the realm," we must have a poor opinion of his notion of the moral fitness of things—at least as far as his queen was concerned.

Released from the awe and timidity he had always felt in Earl Godwin's presence, the king now put no restraint on his affection for the Normans, who flocked over in greater shoals than ever to make their fortunes in England. A few months after Godwin's exile he expressed his anxious desire to have William Duke of Normandy for his guest; and that ambitious and most crafty prince, who already began to entertain projects on England, readily accepted the invitation, and came over with a numerous retinue in the fixed purpose of turning the visit to the best account, by personally informing himself of the strength and condition of the country, and by influencing the councils of the king, who had no children to succeed him, and was said to be labouring under a vow of perpetual chastity, even as if he had been a cloistered monk.

William was the natural son of Robert, Duke of Normandy, the younger brother of Duke Richard III., and the son of Duke Richard II., who was brother to Queen Emma, the mother of King Edward and of the murdered Alfred, by Ethelred, as also of the preceding kings Harold and Hardicanute, by her second husband, Canute the Great. On the mother's side William's descent was sufficiently obscure. One day as the Duke Robert was returning from the chase he met a fair girl, who, with companions of her own age, was washing clothes in a brook. Struck by her surpassing beauty, he sent one of his discreetest knights to make proposals to her family. Such a mode of proceeding is startling enough in our days; but in that age of barbarism and the license of power, the wonder is he did not seize the lowly maiden by force, without treaty or negotiation. The father of the maiden, who was a currier or tanner of the town of Falaise, at first received the proposals of Robert's love-ambassador with indignation; but, on second thoughts, he went to consult one of his brothers, a hermit in a neighbouring forest, and a man enjoying a great religious reputation; and this religious man gave it as his opinion that one ought, in all things, to conform to the will of the powerful man. The name of the maid of Falaise was Arlete, Harlotta, or Herleva, for she is indiscriminately called by these different appellations, which all seem to come from the old Norman or Danish compound *Herleve*, "The much loved." And the Duke continued to love her dearly, and he brought up the boy William he had by her with as much care and honour as if he had been the son of a lawful spouse. Although—or perhaps it will be more correct to say—*because* their conversion was of a comparatively recent date, no people in Europe surpassed the Normans in their devotion, or their passion for distant pilgrimages. When William was only seven years old his father, Duke Robert, resolved to go to Jerusalem, as a pilgrim, to obtain

the remission of his sins. As he had governed his states wisely, his people heard of his intention with alarm and regret; but his worldly advantage could not be put in the balance against his spiritual welfare. The Norman chiefs, still anxious to retain him among them, represented that it would be a bad thing for them to be left without a head. The native chroniclers put the following naïf reply into the mouth of Duke Robert: "By my faith, Sirs, I will not leave you without a seigneur. I have a little bastard, who will grow big, if it pleases God! Choose him from this moment, and, before you all, I will put him in possession of this Duchy as my successor." The Normans did what the Duke Robert proposed, "because," says the chronicle, "it suited them so to do." According to the feudal practice, they, one by one, placed their hands within his hands, and swore fidelity to the child. Robert had a presentiment that he should not return; and he never did: he died about a year after (A.D. 1034) on his road home. He had scarcely donned his pilgrim's weeds and departed from Normandy, when several of the chiefs, and above all the relations of the old Duke, protested against the election of William, alleging that a bastard was not worthy of commanding the children of the Scandinavians. A civil war ensued, in which the party of William was decidedly victorious. As the boy advanced in years, he showed an indomitable spirit and a wonderful aptitude in learning those knightly and warlike exercises which then constituted the principal part of education. This endeared him to his partisans; and the important day on which he first put on armour, and mounted his battle-steed without the aid of stirrup, was held as a festal day in Normandy. Occasions were not wanting for the practice of war and battles, but were, on the contrary, frequently presented both by his own turbulent subjects and his ambitious neighbours. From his tender youth upwards, William was habituated to warfare and bloodshed, and to the exercise of policy and craft, by which he often succeeded when force and arms failed. His contemporaries tell us that he was passionately fond of fine horses, and caused them to be brought to him from Gascony, Auvergne, and Spain, preferring above all those steeds which bore proper names by which their genealogy was distinguished. His disposition was revengeful and pitiless in the extreme. At an after period of life, when he had imposed respect or dread upon the world, he scorned the distinctions between legitimate and illegitimate birth, and more than once bravingly put "We, William the Bastard" to his charters and declarations;* but at the commencement of his career he was exceedingly susceptible and sore on this point, and often took sanguinary vengeance on those who scoffed at the stain of his birth. One day while he was beleaguering the town of Alençon, the besieged took it into their heads to cry out from the top of their walls, "The hide! the hide!—have at the hide!" and to shake and beat pieces of tanned leather, in allusion to the humble calling of William's maternal grandfather. As soon as the bastard heard this, he caused the feet and hands of all the Alençon prisoners in his power to be cut off, and then thrown by his slingers within the walls of the town.

The fame of William's doings had long preceded him to this island, where they created very different emotions, according to men's dispositions and interests. But when he arrived himself in England, with a numerous and splendid train, it is said that the Duke of Normandy might have doubted, from the evidence of his senses, whether he had quitted his own country. Normans commanded the Saxon fleet he met at Dover, Normans garrisoned the castle and a fortress on a hill at Canterbury; and as he advanced on the journey, Norman knights, bishops, abbots, and burgesses met him at every relay to bid him welcome. At the court of Edward, in the midst of Norman clerks, priests, and nobles, who looked up to him as their "natural lord," he was more a king than the king himself; and every day he spent in England must have conveyed additional conviction of the extent of Norman influence, and of the weakness and disorganization of the country.

It is recorded by the old writers, that king Edward gave a most affectionate welcome to his good cousin Duke William,—that he lived lovingly with him while he was here,—and that, at his departure, he gave him a most royal gift of arms, horses, hounds, and hawks.* But what passed in the private and confidential intercourse of the two princes, these writers knew not, and attempted not to divine;† and the only evident fact is, that, after William's visit, the Normans in England carried their assumption of superiority still higher than before.

But preparations were in progress for the interrupting of this domination. Ever since his flight into Flanders, Godwin had been actively engaged in devising means for his triumphant return, and in corresponding with and keeping up the spirits of the Saxon party at home. In the following summer (A.D. 1052) the great earl having well employed the money and treasure he took with him, got together a number of ships, and, eluding the vigilance of the royal fleet, which was commanded by two Normans, his personal and deadly enemies, he fell upon our southern coast, where many Saxons gave him a hearty welcome. He had previously won over the Saxon garrison and the mariners of Hastings, and he now sent secret emissaries all over the country, at whose representations hosts of people took up arms, binding themselves by oath to the cause of the exiled chief, and "promising, all *with one voice*," says Roger

* In one of his English charters, preserved in Hickes, he styles himself, with less truth, "Rex Hereditarius."

* Maistre Wace, Roman du Rou.

† Ingulf intimates, that at this visit William did not introduce the subject of his succession to the English throne, being well content to let things take their natural course, which could hardly run counter to his ambitious hopes.

of Hoveden, "to live or die with Godwin." Sailing along the Sussex coast to the Isle of Wight, he was met there by his sons Harold and Leofwin, who had brought over a considerable force in men and ships from Ireland. From the Isle of Wight the Saxon chiefs sailed to Sandwich, where they landed part of their forces without opposition, and then, with the rest, boldly doubled the North Foreland, and sailed up the Thames towards London. As they advanced, the popularity of their cause was manifestly displayed; the Saxon and Anglo-Danish troops of the king and all the royal ships they met went over to them; the burghers and peasants hastened to supply them with provisions, and to join the cry against the Normans. In this easy and triumphant manner did the exiles reach the suburb of Southwark, where they anchored, and landed without being obliged to draw a sword or pull a single bow. Their presence threw everything into confusion, and the court party soon saw that the citizens of London were as well affected to Godwin as the rest of the people had shown themselves. The earl sent a respectful message to the king, requesting for himself and family the revision of the irregular sentence of exile, the restoration of their former territories, honours, and employments,—promising, on these conditions, a dutiful and entire submission. Though he must have known the critical state of his affairs, Edward was firm or obstinate, and sternly refused the conditions. Godwin despatched other messengers, but they returned with an equally positive refusal; and then the old earl had the greatest difficulty in restraining his irritated partisans. But the game was in his hand, and his moderation and aversion to the spilling of kindred blood greatly strengthened his party. On the opposite side of the river a royal fleet of fifty sail was moored, and a considerable army was drawn up on the bank; but it was soon found there was no relying either on the mariners or the soldiers, who, for the most part, if not won over to the cause of Godwin, were averse to civil war. Still, while most of his party were trembling around him, and not a few seeking safety in flight or concealment, the king remained inflexible, and, to all appearance, devoid of fear. The boldest of his Norman favourites, who foresaw that peace between the Saxons would be their ruin, ventured to press him to give the signal for attack; but the now openly expressed sentiments of the royal troops, and the arguments of the priest Stigand and of many of the Saxon nobles, finally induced Edward to yield, and give his reluctant consent to the opening of negotiations with his detested father-in-law. At the first report of this prospect of a speedy reconciliation, there was a hurried gathering together of property or spoils, and a shoeing and saddling of horses for flight. No Norman or Frenchman of any consequence thought his life safe. Robert, the archbishop of Canterbury, and William, bishop of London, having armed their retainers, took horse and fought their way sword in hand through the city, where many English were killed or wounded. They escaped through the eastern gate of London, and galloped with headlong speed to Ness, in Essex. So great was the danger or the panic of these two prelates, that they threw themselves into an ill-conditioned small open fishing-boat; and thus, with great suffering, and at an imminent hazard, crossed the Channel to France. The rest of the foreign favourites fled in all directions, some taking refuge in the castles or fortresses commanded by their countrymen, and others making for the shores of the British Channel, where they lay concealed until favourable opportunities offered for passing over to the Continent.

In the mean time the witenagemot was summoned; and when Godwin, in plenitude of might, appeared before it, after having visited the humbled king, the "earls" and "all the best men of the land" agreed in the proposition, that the Normans were guilty of the late dissentions, and Godwin and his sons innocent of the crimes of which they had been accused. With the exception of four or five obscure men, a sentence of outlawry was hurled against all the Normans and French; and, after he had given hostages to Edward, Godwin and his sons, with the exception only of Sweyn, received full restitution; and, as a completion of his triumph, his daughter Editha was removed from her monastic prison to court, and restored to all her honours as queen. The hostages granted were Wilnot, the youngest son, and Haco, a grandson of Godwin. Edward had no sooner got them into his hands, than, for safer custody, he sent them over to his cousin William of Normandy; and from this circumstance there arose a curious episode or under-act in the treacherous and sanguinary drama. The exclusion of Sweyn from pardon, and a nominal restoration to the king's friendship, did not arise from the active part he had taken in the Norman quarrel, but was based in his old crimes, and more particularly the treacherous murder of his cousin Beorn. It seems that his family acquiesced in the justice of his sentence of banishment, and that Sweyn himself, now humble and penitent, submitted without a struggle. He threw aside his costly mantle and his chains of gold, his armour, his sword, and all that marked the noble and the warrior; he assumed the lowly garb of a pilgrim, and, setting out from Flanders, walked barefoot to Jerusalem—that great pool of moral purification, which, according to the notion of the times, could wash out the stains of all guilt. He reached the holy city in safety—he wept and prayed at all the holiest places there,—but, returning through Asia Minor, he died in the province of Lycia.

Godwin did not long survive the re-establishment of Saxon supremacy, and his complete victory over the king. According to Henry of Huntingdon and other chroniclers, a very short time after their feigned reconciliation, as Godwin sat at table with the king at Windsor, Edward again reproached the earl with his brother Alfred's mur-

der. "Oh, king!" (Godwin is made to say) "whence comes it that, at the least remembrance of your brother, you show me a bad countenance? If I have contributed even indirectly to his cruel fate, may the God of heaven cause this morsel of bread to choke me!" He put the bread to his mouth, and of course, according to this story, was choked, and died instantly. But it appears, from better authority, that Godwin's death was by no means so sudden and dramatic; that though he fell speechless from the king's table on Easter Monday (most probably from apoplexy), he was taken up and carried into an inner chamber by his two sons Tostig and Gurth, and did not die till the following Thursday. Harold, the eldest, the handsomest, the most accomplished, and in every respect the best of all the sons of Godwin, succeeded to his father's territories and commands, and to even more than Godwin's authority in the nation; for, while the people equally considered him as the great champion of the Saxon cause, he was far less obnoxious than his father to the king; and, whereas his father's iron frame was sinking under the weight of years, he was in the prime and vigour of life. The spirit of Edward, moreover, was subdued by misfortune, the fast-coming infirmities of age, and a still increasing devotion, that taught him all worldly dominion was a bauble not worth contending for. He was also conciliated by the permission to retain some of his foreign bishops, abbots, and clerks, and to recall a few other favourites from Normandy.

The extent of Harold's power was soon made manifest. On succeeding to Godwin's earldom, he had vacated his own command of East Anglia, which was bestowed by the court on Algar, the son of Earl Leofric, the hereditary enemy of the house of Godwin, who had held it during Harold's disgrace and exile. As soon as he felt confident of his strength, Harold caused Algar to be expelled his government and banished the land, upon an accusation of treason; and, however unjust the sentence may have been, it appears to have been passed with the sanction and concurrence of the witenagemot. Algar, who had married a Welsh princess, the daughter of King Griffith, fled into Wales, whence, relying on the power and influence possessed by his father, the Earl Leofric, and by his other family connexions and allies, he shortly after issued with a considerable force, and fell upon the county and city of Hereford, in which latter place he did much harm, burning the minster and slaying seven canons, besides a multitude of laymen. Rulf, or Radulf, the earl of Hereford, who was a Norman, and a nephew of the king's, made but a feeble resistance; and, it is said, he destroyed the efficiency of the Saxon troops, by making them fight the Welsh on *horseback*, "against the custom of their country." Harold soon hastened to the scene of action, and advancing from Gloucester with a well-appointed army, defeated Algar, and followed him in his retreat through the mountain defiles and across the moors and morasses of Wales. Algar, however, still showed himself so powerful, that Harold was obliged to treat with him. By these negotiations, he was restored to his former possessions and honours; and when, very shortly after, his father Leofric died, Algar was allowed to take possession of his vast earldoms. The king seems to have wished that Algar should have been a counterpoise to Harold, as Leofric had once been to Godwin; but both in council and camp Harold carried everything before him, and his jealousy being again excited, he again drove Algar into banishment. Algar, indeed, was no mean rival. Both in boldness of character and in the nature of his adventures, he bore some resemblance to Harold. This time he fled into Ireland, whence he soon returned with a small fleet and an army, chiefly raised among the Northmen who had settled on the Irish coasts, and who thence made repeated attacks upon England. With this force, and the assistance of the Welsh under his father-in-law King Griffith, he recovered his earldoms by force of arms, and held them in defiance of the decrees of the king, who, whatever were his secret wishes, was obliged openly to denounce these proceedings as illegal and treasonable. After enjoying this triumph little more than a year, Algar died (A.D. 1059), and left two sons, Morcar and Edwin, who divided between them part of his territories and commands.

While these events were in progress, other circumstances had occurred in the north of England which materially augmented the power of Harold. Siward, the great Earl of Northumbria, another of Godwin's most formidable rivals, had died, after an expedition into Scotland; and as his elder son Osberne had been slain, and his younger son Waltheof was too young to succeed to his father's government, the extensive northern earldom was given to Tostig, the brother of Harold. Siward, as will be presently related more at length, had proceeded to Scotland to assist in seating his relation Prince Malcolm, the son of the late King Duncan, upon the throne of that country, which had been usurped by Duncan's murderer, Macbeth. It was in this enterprise, and before it was crowned with final success, that, as has just been mentioned, Osberne, the pride of his father's heart, was slain. He appears to have fallen in the first battle fought with Macbeth (A.D. 1054) near the hill of Dunsinan. Checking his natural emotions, the old earl asked how the young man had fallen; and being told that he had received all his wounds in front, like a brave man, he said he was satisfied, and wished no better death for himself. He did not, however, die in battle, nor *would* he die in his bed,—a death he held to be dishonourable. Soon after his return from Scotland he was attacked by a fatal disorder. As he felt his end approaching he said to his attendants, "Lift me up, that I may die on my legs, like a soldier, and not crouching, like a cow! Dress me with my coat of mail,—cover my head with my helmet,—put my shield

on my left arm, and my battle-axe in my right hand, that I may die under arms!"*

Siward, who was a Dane, either by birth or near descent, was much beloved by the Northumbrians, who were themselves chiefly of Danish extraction. They called him *Sigward-Digr*, or Siward the Strong; and many years after his death they showed, with pride, a rock of solid granite which they pretended he had split in two with a single blow of his battle-axe. To his irregular successor, Tostig, the brother of Harold, they showed a strong dislike from the first, and this aversion was subsequently increased by acts of tyranny on the part of the new earl. In another direction the popularity of Harold was increased by a most successful campaign against the Welsh, who had inflamed the hatred of the Saxon people by their recent forays and cruel murders. Their great leader, King Griffith, had been weakened and exposed by the death of his son-in-law, and Harold's rival, the Earl Algar, in 1059; and after some minor operations, in one of which Rees, the brother of Griffith, was taken prisoner and put to death, by the order of King Edward, as a robber and murderer, Harold was commissioned, in 1063, to carry extreme measures into effect against the ever-turbulent Welsh. The great earl displayed his usual ability, bravery, and activity, and by skilfully combined movements, in which his brother Tostig and the Northumbrians acted in concert with him, by employing the fleet along the coast, by accoutring his troops with light helmets, targets, and breast-pieces made of leather (instead of their usual heavy armour), in order that they might be the better able to follow the fleet-footed Welsh, he gained a succession of victories, and finally reduced the mountaineers to such despair that they decapitated their king, Griffith, and sent his bleeding head to Harold, as a peace-offering and token of submission. The two half-brothers of Griffith swore fealty and gave hostages to King Edward and Harold. They also engaged to pay the ancient tribute; and a law was passed that every Welshman found in arms to the east of Offa's dyke should lose his right hand. From this memorable expedition, the good effects of which were felt in England, through the tranquillity of the Welsh, for many years after, Harold returned in a sort of Roman triumph to the mild and peaceable Edward, to whom he presented the ghastly head of Griffith, together with the rostrum or beak of that king's chief war-ship.

The king's devotion still kept increasing with his years, and now, forgetful of his bodily infirmities, which in all probability would have caused his death on the road, and indifferent to the temporal good of his people, he expressed his intention of going in pilgrimage to Rome, asserting that he was bound thereto by a solemn vow. The Witan objected that, as he had no children, his absence and death would expose the nation to the dangers of a disputed succession; and then the king for the first time turned his thoughts to his nephew and namesake Edward, the son of his half-brother, Edmund Ironside. The long neglect of this prince of the old race of Cerdic and Alfred, which, counting from the time of King Edward's accession, had extended over a period of more than twenty years, shows but slight affection for that Saxon family; and, as the king had never expected any children of his own to succeed him, it seems to confirm the statement of those old writers who say he had all along intended to bequeath his crown to his cousin William of Normandy. But at this moment Norman interest and influence, though not dried up, were at a low ebb: be his wishes what they might, Edward durst not propose the succession of William, and being pressed by the Witan, and his own eager desire of travelling to Rome, he sent an embassy to the German emperor Henry III., whose relative the young prince had married, requesting he might be restored to the wishes of the English nation. Edward the Atheling, or Edward the Outlaw, as he is more commonly called, obeyed the summons with alacrity, and soon arrived in London with his wife Agatha and his three young children —Edgar, Margaret, and Christina. The race of their old kings was still dear to them; Edmund Ironside was a national hero inferior only to the great Alfred; his gallantry, his bravery, his victories over the Danes, were sung in popular songs, and still formed the subject of daily conversation among the Saxon people, who therefore received his son and grandchildren with the most hearty welcome and enthusiastic joy. But though King Edward had invited over his nephew with the professed intention of proclaiming him his heir to the crown, that prince was never admitted into his presence. This circumstance could not fail of creating great disgust; but this and all other sentiments in the popular mind were speedily absorbed by the deep and universal grief and despondence caused by Prince Edward's death, who expired in London shortly after his arrival in that city, and was buried in the cathedral of St. Paul's. This sudden catastrophe, and the voluntary or constrained coyness of the king towards his nephew, have awakened horrid suspicions of foul play. The more generally received opinion seems to be that the prince was kept at a distance by the machinations and contrivances of the jealous Harold, and that that earl caused him to be poisoned, in order to remove what he considered the greatest obstacle to his own future plans. In justice, however, the memory of Harold ought not to be loaded with a crime which, possibly, after all, was never committed; for the prince might very well have died a natural death, although his demise tallied with the views and interests of Harold. His long neglect of him proved that the king had no affection for his nephew, whom he had recalled at last by compulsion of the nation. The animosities borne by sovereigns against those who are to succeed them, even when their successors

* Hen. Hunt.—Higden.

are their own children, have prevailed in all ages. These causes would sufficiently account for Prince Edward's not being readily received by his uncle, who, moreover, in many circumstances of his life, showed himself a moody, wayward man, wanting "the natural touch." There is no proof, nor shadow of proof, that Harold circumvented and then destroyed the prince. It is merely presumed that, because the earl gained most by his death, he caused him to be killed. But William of Normandy gained as much as Harold by the removal of the prince, and was, at the very least, as capable of extreme and treacherous measures. During his visit in England the king may have promised the duke that he would never receive his nephew Edward; and, while this circumstance would of itself account for the king's shyness, the coming of the prince would excite the jealousy and alarm of William, who had emissaries in the land, and friends and partisans about the court. Supposing, therefore, Prince Edward to have been murdered (and there is no proof that he was), the crime was as likely to have been committed by the orders of the duke as by those of the earl.

The demise of Edward the Outlaw certainly cut off the national hope of a continuance of the old Saxon dynasty; for, though he left a son, called Edgar the Atheling, that prince was very young, feeble in body, and in intellect not far removed from idiotcy. The latter circumstance forbade all exertion in his favour; but, had he been the most promising of youths, it is very doubtful whether a minor would not have been crushed by one or other of two such bold and skilful competitors as William and Harold. As matters stood, the king, whose journey to Rome could be no more talked of, turned his eyes to Normandy, while many of the Saxons began to look up to Harold, the brother of the queen, as the best and most national successor to the throne.

Here we again reach a point in our annals that, like so many others, is involved in mystery and the most perplexing contradictions. According to some writers, Edward now for the first time made a will, bequeathing the crown to his cousin; according to others he had made this will long before, when the recall of Prince Edward was not thought of, and had privately communicated the nature of his testament to Duke William, through the medium of Robert, the Norman Archbishop of Canterbury. On one side it is stated that Harold was, to the last, kept in the dark as to these proceedings; on another, it is as confidently asserted that, in 1065, about a year before the king's death, Harold himself was the messenger appointed to convey to William the intelligence of the will, which (according to this version of the story) was now first executed.

Harold taking Leave of Edward on his Departure for Normandy. From the Bayeux Tapestry.*

* The Bayeux Tapestry is a roll of linen 20 inches broad, and 214 feet in length, on which is worked with woollen thread, of different colours, a representation, in seventy-two distinct compartments, of the whole history of the Norman conquest of England, from the departure of Harold for Normandy to the rout of the Saxons at the battle of Hastings. It embraces all the incidents of Harold's stay in Normandy, and has preserved some that have not been noticed by any of the chroniclers. Every compartment has a superscription in Latin, indicating its subject; a specimen of these titles is given in one of the cuts below. The Bayeux tapestry is said by tradition to have been the work of the Conqueror's queen, Matilda, and to have been presented by her to the cathedral of Bayeux, of which her husband's half-brother, Odo, one of those who rendered the most effective service in the invasion of England, was bishop; and the delineations, which correspond in the minutest points with what we know of the manners of that age, afford the strongest evidence that it is of this antiquity. It was preserved in the cathedral of Bayeux till 1803, having been wont to be exhibited for some days in every year to the people, in the nave of the church, round which it exactly went. It is now in the hotel of the prefecture of that city, where it is kept coiled round a roller, from which it is unwound upon a table for inspection. An engraving of the whole, in sixteen plates, coloured like the original, and one-fourth of the original size, was published by the Society of Antiquaries, in the sixth vol. of the 'Vetusta Monumenta.' The cuts we have given are reduced from these plates.

That Harold went to Normandy at this time is certain, but it is said that his sole object in going was to obtain the release of his brother Wulnot and his nephew Haco, the two hostages for the Godwin family, whom Edward had committed to the custody of Duke William, but who the king was now willing should be restored. Another opinion is, that Harold's going at all was wholly accidental. According to the latter version, being one day at his manor of Bosenham, or Bosham, on the Sussex

HAROLD ON HIS JOURNEY TO BOSHAM. Bayeux Tapestry.

HAROLD ENTERING BOSHAM CHURCH. Bayeux Tapestry.

coast, he went into a fishing-boat for recreation with but few attendants, and those not very expert mariners, and scarcely was he launched into the deep when a violent storm suddenly arose, and drove the ill-managed boat upon the opposite coast of France; but whether he went by accident or design, or whatever were the motives of the voyage, the following facts seem to be pretty generally admitted.

Harold was wrecked or stranded near the mouth of the river Somme, in the territory of Guy, Count of Ponthieu, who, according to a barbarous practice not uncommon, and held as good law in the middle ages, seized the wreck as his right, and made the passengers his prisoners until they should pay a heavy ransom for their release. From the castle of Belram, now Beaurain, near Montreuil, where the earl and his retinue were shut up, after they had been despoiled of the best part of their baggage, Godwin made his condition known to Duke William, and entreated his good offices. The duke could not be blind to the advantages that might be derived from this accident, and he instantly and earnestly demanded that Harold should be released and sent to his court. Careful of his money, William at first em-

Harold coming to Anchor on the Coast of Normandy. Bayeux Tapestry.

ployed threats, without talking of ransom. The Count of Ponthieu, who knew the rank of his captive, was deaf to these menaces, and only yielded on the offer of a large sum of money from the duke, and a fine estate on the river D'Eaune. Harold then went to Rouen; and the bastard of Normandy had the gratification of having in his court, and in his power, and bound to him by this recent obligation, the son of the great enemy of the Normans,—one of the chiefs of the league that had banished from England the foreign courtiers, the friends and relations of William, those on whom his hopes rested, the intriguers in his favour for the royalty of that kingdom. Although received with much magnificence, and treated with great respect, and even a semblance of affection, Harold soon perceived he was in a more dangerous prison at Rouen than he had been in the castle of Belram. His aspirations

Harold's Appearance at the Court of Duke William. Bayeux Tapestry.

to the English crown could be no secret to himself, and his inward conscience would make him believe they were well known to William, who could not be ignorant of his past life and present power in the island. If he was indeed uninformed as yet as to William's intentions, that happy ignorance was soon removed, and the whole peril of his present situation placed full before him by the duke, who said to him one day, as they were riding side by side,—"When Edward and I lived together, like brothers, under the same roof, he promised me that, if ever he became king of England, he would make me his successor. Harold! I would, right well, that you helped me in the fulfilment of this promise; and be assured that if I obtain the kingdom by your aid, whatever you choose to ask shall be granted on the instant." The liberty and life of the earl were in the hands of the proposer, and so Harold promised to do what he could. William was not to be satisfied with vague pro-

mises. "Since you consent to serve me," he continued, "you must engage to fortify Dover Castle, to dig a well of good water there, and to give it up to my men-at-arms: you must also give me your sister, that I may marry her to one of my chiefs; and you, yourself, must marry my daughter Adele. Moreover, I wish you, at your departure, to leave me, in pledge of your promises, one of the hostages whose liberty you now reclaim: he will stay under my guard, and I will restore him to you in England when I arrive there as king." Harold felt that to refuse or object would be not only to expose himself, but his brother and nephew also, to ruin; and the champion of the Saxon cause, hiding his heart's abhorrence, pledged himself verbally to deliver the principal fortress of his country to the Normans, and to fulfil all the other engagements, which were as much forced upon him as though William had held the knife to his defenceless throat. But the ambitious, crafty, and suspicious Norman was not yet satisfied.

In the town of Avranches, or, according to other authorities, in the town of Bayeux, William summoned a grand council of the barons and headmen of Normandy to be witnesses to the oaths he should exact from the English earl. The sanctity of an oath was so frequently disregarded in these devout ages, that men had begun to consider it not enough to swear by the majesty of heaven, and the hopes of eternal salvation, and had invented sundry plans, such as swearing upon the host or consecrated wafer, and upon the relics of saints and martyrs, which, in their dull conception, were things far more awful and binding. But William determined to gain this additional guarantee by a trick. On the eve of the day fixed for the assembly, he caused all the bones and relics of saints preserved in all the churches and monasteries in the country to be collected and deposited in a large tub, which was placed in the council-chamber, and covered and concealed under a cloth of gold. At the appointed meeting, when William was seated on his chair of state, with a rich sword in his hand, a golden diadem on his head, and all his Norman chieftains round about him, the missal was brought in, and being opened at the evangelists, was laid upon the cloth of gold which covered the tub, and gave it the appearance of a rich table or altar. Then Duke William rose and said, "Earl Harold, I require you, before this noble assembly, to confirm, by oath, the promises you have made me—to wit, to assist me in obtaining the kingdom of England, after king Edward's death, to marry my daughter Adele, and to send me your sister, that I may give her in marriage to one of mine."

HAROLD'S OATH TO WILLIAM. Bayeux Tapestry.

Harold, who, it is said, was thus publicly taken by surprise, durst not retract: he stepped forward with a troubled and confused air, laid his hand upon the book, and swore. As soon as the oath was taken, at a signal from the duke, the missal was removed, the cloth of gold was taken off, and the large tub was discovered filled to the very brim with dead men's bones and dried up bodies of saints, over which the son of Godwin had sworn without knowing it. According to the Norman chroniclers, Harold shuddered at the sight.*

Having, in his apprehension, thus made surety doubly sure, William loaded Harold with presents, and permitted him to depart. Liberty was restored to young Haco, who returned to England

Harold's Interview with King Edward on his Return from Normandy. Bayeux Tapestry

with his uncle, but the politic duke retained the other hostage, Wulnot, as a further security for the faith of his brother the earl.

Harold had scarcely set foot in England when he was called to the field by circumstances which, for the present, gave him an opportunity of showing his justice and impartiality or his wise policy, but which soon afterwards tended to complicate the difficulties of his situation. His brother Tostig, who had been entrusted with the government of Northumbria on good Siward's death, behaved with so much rapacity, tyranny, and cruelty, as to provoke a general rising against his authority and person. The insurgents—the hardiest and most warlike men of the land—marched upon York, where their obnoxious governor resided. Tostig fled like a coward; his treasury and armoury were pillaged, and two hundred of his body-guard, the tools of his tyranny, were massacred in cold blood on the banks of the Ouse. The Northumbrians, then, despising the weak authority of the king, determined to choose an earl for themselves; and their choice fell on Morcar, one of the sons of Earl Algar, the old enemy of Harold and his family. Morcar, whose power and influence were extensive in Lincoln, Nottingham, and Derbyshire, readily accepted the authority offered him, and, gathering together an armed host, and securing the services of a body of Welsh auxiliaries, he not only took possession of the great northern earldom, but advanced to Northampton, with an evident intention of extending his power towards the south of England. But here he was met by the active and intrepid Harold, who had never yet returned vanquished from a field of battle. Before drawing the sword against his own countrymen, the son of Godwin proposed a conference. This was accepted by the Northumbrians, who, at the meeting, exposed the wrongs they had suffered from Tostig, and the motives of their insurrection. Harold endeavoured to palliate the faults of his brother, and promised, in his name, better conduct for the future, if they would receive him back as their earl lawfully appointed by the king. But the Northumbrians unanimously protested against any reconciliation with the chief who had tyrannised over them. "We were born free men," said they, "and were brought up in freedom; a proud chief is to us unbearable—for we have learned from our ancestors to live free, or die."

The crimes of Tostig were proved, and Harold, giving up his brother's cause as lost, agreed to the demands of the Northumbrians, that the appointment of Morcar as earl should be confirmed. A truce being concluded, he hastened to obtain the consent of the king, which was little more than a matter of form, and granted immediately. The Northumbrians then withdrew with their new earl, Morcar, from Northampton; but during Harold's short absence at court, to complete the treaty of pacification, and at their departure, they plundered and burned the neighbouring towns and villages, and carried off some hundreds of the inhabitants, whom they kept for the sake of ransom. The English pulse beats high at the tone of the Northumbrians' protest; but in these barbarous times the heart cannot fully enlist itself in favour of any one cause, or party, or set of men. As for the expelled Tostig, he fled to Bruges, the court of Baldwin, earl of Flanders, whose daughter he had married, and, burning with rage and revenge, and considering himself betrayed or unjustly abandoned by his brother Harold, he opened a correspondence, and sought friendship and support, with William of Normandy.

The childless and now childish Edward was dying. A recent historian* suggests that Harold's moderation in the affair of the Northumbrian insurrection may be partly attributed to a prudent regard for his own interests, which, at this moment of crisis, required his immediate presence in Lon-

* Dr. Lingard.

don, that he might look after the succession to the crown. There may be some grounds for this supposition, which, however, must add to his reputation for wisdom, policy, and command of temper, however they may detract from his impartiality and abstract love of justice. An inferior statesman would have involved the country in a civil war, at a moment when, of all others, it was most essential to him and the nation that it should be tranquil and united.

Harold arrived in London on the last day of November; the king grew worse and worse; and in the first days of January it was evident that the hand of death was upon him. The veil of mystery

THE SICKNESS AND DEATH OF EDWARD THE CONFESSOR. Bayeux Tapestry.

and doubt again thickens round the royal deathbed. The writers who go upon the authority of those who were in the interest of the Norman, positively affirm that Edward repeated the clauses of his will, and named William his successor; and that when Harold and his kinsmen forced their way into his chamber to obtain a different decision, he said to them with his dying voice, "Ye know right well, my lords, that I have bequeathed my kingdom to the duke of Normandy; and are there not those *here*, who have plighted oaths to secure William's succession?" On the other side, it is maintained, with equal confidence, that he named Harold his successor, and told the chiefs and churchmen that no one was so worthy of the crown as the great son of Godwin.

The Norman Duke, whose *best* right (if *good* or *right* can be in it) was the sword of conquest, always insisted on the intentions and last will of Edward. But, although the will of a popular king was occasionally allowed much weight in the decision, it was not imperative or binding to the Saxon people without the consent and concurrence of the Witenagemot,—the parliament or great council of the nation,—to which source of right the Norman, very naturally, never thought of applying. The English crown was in great measure an elective crown. This fact is sufficiently proved by the irregularity in the succession, which is not reconcileable with any laws of heirship and primogeniture, for we frequently see the brother of a deceased king preferred to all the sons of that king, or a younger son put over the head of the eldest. As the royal race ended in Edward, or only survived in an imbecile boy, it became imperative to look elsewhere for a successor, and upon whom could the eyes of the nation so naturally fall as upon the experienced, skilful, and brave Harold, the defender of the Saxon cause, and the near relation by marriage of their last king? Harold, therefore, derived his authority from what ought always to be considered its most legitimate source, and which was actually acknowledged to be so in the age and country in which he lived. William, a foreigner of an obnoxious race, rested his claim on Edward's dying declaration, and on a will that the king had no faculty to make or enforce without the consent and ratification of the states of the kingdom; and, strange to say, this will, which was held by some to give a plausible, or even a just title (which it did not), *was never produced*, whence people concluded it had never existed. If a signed and sealed will would have been little, the dying declaration, subject to all sorts of misinterpretation, ought to be considered as nothing. The probabilities however are, that Edward, bound by old promises and affections, and moved by old animosities, really *wished* to appoint the Duke and exclude the Earl,—that in the presence of his wife and her family he had not courage to insist on this wish, and that, when worn out by importunities, he faintly declared, as is reported, that the English

nation might name Harold or whomsoever they liked best for their king. He probably knew better than any man the resolute character of both competitors, and may therefore have trembled at the prospect of the war and misery about to befal his people, to whom, in spite of his weaknesses and foreign prejudices, he was sincerely attached. The chroniclers agree in stating that he was visited by frightful visions,—that he repeated the most menacing passages of the Bible, which came to his memory involuntarily, and in a confused manner,—and that the day before his death he pronounced a fearful prophecy of woe and judgment to the Saxon people. At these words there was "dole and sorrow enough;" but Stigand, the Archbishop of Canterbury, could not refrain from laughing at the general alarm, and said the old man was only dreaming and raving as sick old men are wont to do.

During these his last days, however, the anxious mind of the king was in good part absorbed by the care for his own sepulture, and his earnest wish that Westminster Abbey, which he had rebuilt from the foundation, should be completed and consecrated before he departed this life. The works, to which he had devoted a tenth part of his revenue, were pressed,—they were finished; but on the Festival of the Innocents, the day fixed for the consecration, he could not leave his chamber; and the grand ceremony was performed in presence of Queen Editha, who represented her dying husband, and of a great concourse of nobles and priests who had been bidden in unusual numbers to the Christmas festival, that they might partake in this solemn celebration. He expired on the 5th of January, 1066; and, on the very next day, the Festival of the Epiphany, all that remained of the last Saxon king of the race of Cerdic and Alfred was interred with great pomp and solemnity, within the walls of the sacred edifice he had just lived time enough to complete. He was in his sixty-fifth or sixty-sixth year, and had reigned over England nearly twenty-four years.

In the character of Edward the Confessor there were many amiable and excellent traits. In an age when war was considered the fittest and noblest occupation for a king, he was a sincere and consistent lover of peace. He was an enemy to all violence, force, and oppression, and studied, not unsuccessfully, to relieve the body of the people from the heavy hand of power, and to establish the mild empire of the law. The body of laws he compiled, and which were so fondly remembered in after times, when the Saxons were ground to the dust by Norman tyranny, were selected from the codes or collections of his predecessors Ethelbert, Ina, and Alfred, few or none of them originating in himself, although the gratitude of the nation long continued to attribute them all to him. He felt keenly for the privations and misfortunes of the people; he was averse to burdening them with taxes; and his own economy, together with the comparatively peaceful state in which the kingdom was kept under him, enabled him to lighten the load which had oppressed them during several preceding reigns. It is said he could never look on a heap of gold and silver in his treasury without making melancholy reflections as to the manner in which it must have been wrung from the people. On one occasion, when he was led by his courtiers to contemplate, as a pleasurable sight, the money that had just been collected by a tax, his imagination was so affected by the prodigious mass, that (says Ingulf) he fancied he saw the Devil leaping exultingly about it, and ordered it to be immediately restored to his poor subjects who had been forced to contribute it. Later historians laugh at this hallucination; but it would have been well for the people if many of the later kings had partaken of Edward's squeamishness of conscience, or even of his superstition, in this respect.

IMPRESSIONS FROM THE GREAT SEAL OF EDWARD THE CONFESSOR.
Engraved from Original Casts.

Superstition, a boundless credulity, and an ascetic and unmanly devotion were, however, the foibles and vices of Edward's character, and though they obtained him canonization from a thankful church, they certainly narrowed the limits of his usefulness in this world, unfitted him, in some essential respects, for the task of government, and entailed a legacy of misery on the Anglo-Saxon nation.

The Crown offered to Harold by the People. Bayeux Tapestry.

Harold was proclaimed king in a vast assembly of the chiefs and nobles, and of the citizens of London, almost as soon as the body of Edward was deposited in the tomb; and the same evening witnessed his solemn coronation, only a few hours intervening between the two ceremonies. The common account is, that Stigand, the Archbishop of Canterbury, who, in right of his office, should have crowned the king, having quarrelled with the court of Rome, and then lying under a sentence of suspension, the ecclesiastic next in dignity, Aldred, Archbishop of York, officiated in his stead; other authorities affirm that Harold crowned himself, or put the crown on his head with his own hands; but both William of Poictiers, a contemporary writer, and Ordericus Vitalis, who lived in the next century, assert that the act was performed by Stigand. This ac-

Coronation of Harold. Bayeux Tapestry.

count seems to be confirmed by the representation of the ceremony on the Bayeux tapestry, where Harold appears seated on the throne, with Stigand standing on his left. In this moment of excitement the strong mind of the Saxon, though not destitute of superstition, may have risen superior to the terrors of the dead men's bones, and the oaths that had been extorted from him most foully and by force in Normandy; but the circumstances, no doubt, made an unfavourable impression on the minds of most of such of his countrymen as were acquainted with them. Still all the southern counties of England hailed his accession with joy, nor was he wanting to himself in exertions to increase his well-established popularity. "He studied by all means which way to win the people's favour, and omitted no occasion whereby he might show any token of bounteous liberality, gentleness, and courteous behaviour towards them. The grievous customs also and taxes, which his predecessors had raised, he either abolished or diminished; the ordinary wages of his servants and men of war he increased, and further showed himself very well bent to all virtue and goodness."* A writer who lived near the time, adds, that from the moment of his accession he showed himself pious, humble, and affable; and that he spared himself no fatigue, either by land or by sea, for the defence of his country.†

The court was effectually cleared of the unpopular foreign favourites; but their property was respected, they were left in the enjoyment of their civil rights, and not a few retained their employments. Some of these Normans were the first to announce the death of Edward, and the coronation of Harold, to Duke William. At the moment when he received this great news he was in his hunting grounds near Rouen, holding a bow in his hand with some new arrows that he was trying. On a sudden he was observed to be very pensive; and giving his bow to one of his people, he threw himself into a skiff, crossed the river Seine, and then hurried on to his palace of Rouen without saying a word to any one. He stopped in the great hall, and strode up and down that apartment; now sitting down, now rising, changing his seat and his posture, as if unable to find rest in any. None of his attendants durst approach, he looked so fierce and agitated: they all kept themselves at a distance, staring at each other in silence. An officer of rank, and one who enjoyed the intimate confidence of the duke, having arrived at the palace, was immediately surrounded by the attendants, all eager to know from him why their prince was so sore troubled. "I know nothing certain," said the officer, "but we shall soon be well informed;" and then advancing alone to William, he thus addressed him:—"My Lord, where is the use of hiding your news from us?—what will you gain by so doing? It is a common rumour in the town that the king of England is dead, and that Harold has seized the kingdom, belying his faith towards you." "They speak the truth," replied the duke; "my spite comes from the death of Edward, and the wrong that Harold has done me." "Well, sire," continued the courtier, "be not wroth at what can be mended. For the death of Edward there is no help, but there is one for the wrongs of Harold: justice is on your side, and you have good soldiers; undertake boldly,—a thing well begun is half done."* Recovering from his reverie, William agreed that ambassadors should be immediately sent to England. When these envoys appeared before Harold, they said, "William, Duke of the Normans, reminds thee of the oath thou hast sworn him with thy mouth and with thy hand on good and holy relics." "It is true," replied the Saxon king, "that I made an oath to William, but I made it under the influence of force: I promised what did not belong to me, and engaged to do what I never could do; for my royalty does not belong to me, nor can I dispose of it without the consent of my country. In the like manner I cannot, without the consent of my country, espouse a foreign wife. As for my sister, whom the duke claims in order that he may marry her to one of his chiefs, she has been dead some time,—will he that I send him her corpse?" A second embassy terminated in mutual reproaches; and then William, swearing that, in the course of the year, he would come to exact all that was due to him, and pursue the perjured Harold even unto the places where he believed his footing the most sure and firm, pressed those preparations for war which he had begun almost as soon as he learned the course events had taken in England.

On the continent the opinion of most men was in favour of William, and Harold was regarded in the light of a sacrilegious oath-breaker, with whom no terms were to be kept. The habitual love of war, and the hopes of obtaining copious plunder, and rich settlements in England, were not without their effect. In the cabinet council which the duke assembled there was not one dissentient voice—all the great Norman lords were of opinion that the island ought to be invaded; and knowing the magnitude of the enterprise, they engaged to serve him with their body and goods, even to the selling or mortgaging their inheritance. "But this is not all," said they: "you must ask the aid, and also the advice, of the Norman people; for it is but right that those who pay the expense should be summoned to consent to it." William then convoked the great parliament or assembly of men of all conditions—warriors, priests, merchants, farmers, and others, at Lillebonne, where he explained his project, and solicited their assistance. After hearing the duke's discourse the members retired, in order that they might deliberate more freely out of the reach of any influence. The Normans were as yet a comparatively free people, and the debate which ensued was loud and stormy. Rising from

* Holingshed.

† Roger of Hoveden.

* Thierry, Hist. de la Conquête de l'Angleterre.—Chronique de Normandie.

their seats, the disputants formed themselves into separate groups, and spoke and gesticulated with much violence. The great plea of those opposed to the enterprise was, that their sovereign had no right to command any of his vassals to cross the seas on military service. In the midst of this disorder William Fitz-Osborn, the grand seneschal of Normandy, raised his voice, and said, "Why do you dispute in this sort? William is your lord; he has need of you; your duty would be to make him the offer of your services, without waiting for his asking them. If you fail him at this crisis, and he obtain his ends without you, by the living God he will remember it against you. Shew, then, that you love him, and act now with a good will." "No doubt," cried the opposition, "he is our lord; but is it not enough for us to pay him his rents? We owe him no aid in his going beyond sea: he has already overburdened us by his wars, and now, if he fails in this new enterprise, our country will be entirely ruined." After a long dispute it was agreed that the seneschal Fitz-Osborn, who was acquainted with the property and means of all of them, should be the person deputed to excuse the assembly for the smallness of its offers. The members all returned to the presence of the duke, when the seneschal, hurried on by his own ardent zeal, delivered a message very different from that which had been agreed upon, declaring nothing less than that each feudatory was ready to serve him beyond sea,—that he who hitherto had furnished only two horse-soldiers would now provide four,—and that in all things his Norman vassals would render double the service to which they were bound by their tenures. At this unexpected discourse a long shout of rage and disapprobation shook the hall. "No! no!" cried the members, "we never charged you with such an answer,—we did not say that,—that will never be. If the duke is pressed in his own country we will serve him, as it is due to him we should, but we are not bound to assist him in conquering the country of other men. Besides, if we do him double service once, and if we follow him once beyond sea, he will hold it as his right and a precedent for the future,—he would thus exact it from our children! This must not be!—this shall never be!" The assembly then broke up in a general tumult.

William was exasperated, for he never brooked an opposition to his decided will; but he was not disheartened, and was sufficiently master of his passion to have recourse to cajolery and artifice. He summoned the members of the assembly into his presence one by one, beginning with the richest and most influential; and, charming them with his condescension, and dazzling them with the certain prospect of gain and glory, he proceeded to assure them that whatever they did now should be considered as voluntary and gratuitous, and should in no sense be held as a right or established as a precedent for future times; and he offered to give them security for this by letters sealed with his great seal. The opposition of the mass was thus overcome in detail; and every person, when he himself was once engaged, endeavoured to bring over others. Some subscribed for ships, others to furnish men-at-arms, others engaged to march in person: the priests gave their gold and silver, the merchants their stuffs, and the farmers their corn and provender. A clerk stood near the duke with a large book open before him, and as the vassals made their promises he wrote them all down in his register. The ambitious William looked far beyond the confines of Normandy for soldiers of fortune to assist him in his enterprise. He had his ban of war published in all the neighbouring countries: he offered good pay to every tall, robust man who would serve him with the lance, the sword, or the cross-bow. A multitude flocked to him from all parts,—from far and near,—from the north and the south. They came from Maine and Anjou; from Poitou and Bretagne; from the country of the French king and from Flanders; from Aquitaine and from Burgundy; from Piedmont beyond the Alps and from the banks of the Rhine. Adventurers by profession, the idle, the dissipated, the profligate, the *enfans perdus* of Europe, hurried at the summons.* Of these, some were knights and chiefs in war, others simple foot-soldiers; some demanded regular pay in money; others merely their passage across the Channel, and all the booty they might make. Some demanded territory in England—a domain, a castle, a town; while others, again, simply wished to secure some rich Saxon lady in marriage. All the wild wishes, all the pretensions of human avarice, were wakened into activity. "William," says the Norman chronicle, "repulsed no one, but promised and pleased all as much as he could." He even sold, beforehand, a bishopric in England to a certain Remi of Fescamp (afterwards canonized as St. Remigius), for a ship and twenty men-at-arms.

When the pope's bull arrived, justifying the expedition, and with it the consecrated banner that was to float over it, the matrons of Normandy sent their sons to enrol themselves for the health of their souls; and the national eagerness for war was increased twofold. Three churchmen, the celebrated Lanfranc, Robert of Jumièges, archbishop of Canterbury, who had been expelled by Earl Godwin and his sons, and a deacon of Lisieux, had been sent on an embassy to Rome, where they urged the cause of William with entire success, and obtained from Alexander III. a holy licence to invade England; on the condition, however, that the Norman duke, when he had conquered our island, should hold it as a fief of the church. This measure was not carried through the consistory without opposition. The man who combated most warmly in its favour was the fiery Hildebrand, then archdeacon of the church of Rome, and afterwards the celebrated Pope Gregory VII. In after years, when William could mock the power he now courted, and quarrelled with the pope, this Gregory re-

* Thierry.—Chron. de Normandie.

minded him of these services in a vehement epistle. "Thou art not ignorant," wrote the pontiff, "of the pains I took in by-gone times for the success of thy enterprise, and that, above all, I suffered on thy account infamy and reproaches from some of my colleagues. They murmured to see me display so much warmth and zeal for the cause of such an homicide; but God knows my intention was good: I believed thee the friend of holy church, and I hoped that, by the grace of Heaven, thy bounty to the church would increase with thy power." The most valid reasons William or his ambassadors could present to the pope were the will of King Edward the Confessor, which was never produced, the perjury and sacrilege of Harold, the forcible expulsion from England of the Norman prelates, and the old massacre of the Danes on St. Brice's day by King Ethelred. But if there was any want of plausibility in the argumentative statement of his case, William, as already intimated, was most liberal and convincing in his promises to the pope, to whom, among other things, he offered an annual tribute, to be levied in England after the fashion set by Canute.

A pontifical diploma signed with the cross, and sealed, according to the Roman usage, with a seal in lead of a round form* was sent to the Norman Duke, and, in order to give him still more confidence and security in his invasion, a consecrated banner, and, a ring of great price, containing one of the hairs of St. Peter, were added to the bull. William repaired in person to St. Germain, in order to solicit the aid of Philip I., king of the French. This sovereign, though tempted by flattering promises, thought fit to refuse any direct assistance; but he permitted (what he probably could not prevent) that many hundreds of his subjects should join the expedition. William's father-in-law, Baldwin of Flanders, gave some assistance in men, ships, and stores; and the other continental princes, pretty generally, encouraged William, in the politic hope, that a formidable neighbour might be kept at a distance for the rest of his life if the expedition succeeded, or so weakened as to be no longer formidable, if it failed. But there was one state, whose history in old times had been singularly mixed and interwoven with that of Britain, which might have proved an impediment. Armorica, now called Bretagne, or Brittany, had become a sort of fief to Normandy; but Conan, the reigning chief or duke of the Bretons, sent a message to William, requiring that, since he was going to be king of England, he should deliver up his Norman duchy to the legitimate descendants of

WILLIAM GIVING ORDERS FOR THE INVASION. Bayeux Tapestry.

Rollo the Ganger,† from whom the Breton said he issued by the female line. Conan did not long survive this indiscreet demand; and his sudden death, by poison, was generally, and above all in Brittany, imputed to William the Bastard. Eudes, or Eudo, the successor of Conan, raised no pretensions, but voluntarily yielding to the influence of William, sent him two of his sons (which he was not bound to do) to serve him in his wars against the English. These two young Bretons, named Brian and Allan,‡ came to the rendezvous accompanied by a troop of men of their own country, who gave them the title of Mac Tierns (the sons of the chief), while the Normans styled them Counts. Other rich Bretons, as Robert de Vitry, Bertrand de Dinan, and Raoul de Gaël, flocked to William's standard, to offer their services as volunteers or as soldiers of fortune.

From early spring all through the summer months the most active preparations had been carried on in all the sea-ports of Normandy. Workmen of all classes were employed in building and equipping ships; smiths and armourers forged lances and made coats of mail; and porters passed incessantly to-and-fro carrying the arms from the workshops to the ships. These notes of pre-

Normans preparing Arms and Military Implements for the Invasion. Bayeux Tapestry.

paration soon sounded across the channel, where Harold became anxious to ascertain the amount and nature of the forces which William had raised. Concealment would have been difficult, and was not considered needful, the Duke probably hoping to astound his rival with the magnitude and completeness of his preparations. At least there is an old story, that a detected spy from England was permitted to see what he chose, and dismissed without hurt, with this message from William—"That Harold need not trouble himself to ascertain the Norman strength, which he should see, and feel too, before the year was at an end."

The first storm of war that burst upon England did not, however, proceed from Normandy, and, but for his own unnatural brother, Harold might possibly have derided the proud threat of William. It will be remembered how this brother, Tostig, expelled from Northumbria, fled with treacherous intentions to the court of the Earl of Flanders, and opened communications with the Duke of Normandy. Soon after Harold's coronation Tostig repaired in person to Rouen, where he boasted to William that he had more credit and real power in England than his brother, and promised him the sure possession of that country if he would only unite with him for its conquest. William was no doubt too well informed to credit this assertion; but he saw the advantage which might be derived from this fraternal hate, and gave Tostig a few ships, with which that miscreant ravaged the Isle of Wight and the country about Sandwich. Retreating before the naval force of his brother, Tostig then went to the coast of Lincolnshire, where he did great harm. He next sailed up the Humber, but was presently driven thence by the advance of Morcar, earl of Northumbria, and his brother Edwin, which two powerful chiefs were now living in friendship with Harold, who had espoused their sister Algitha, and made her queen of England. From the Humber Tostig fled with only twelve small vessels to the north of Scotland, whence, forgetful of his alliance with the Norman duke, he sailed to the Baltic to invite Sweyn the king of Denmark to the conquest of our island. Sweyn wisely declined the dangerous invitation, and then, caring little what rival he raised to his brother, he went to Norway and pressed Harold Hardrada, the king of that country, to invade England. Hardrada, who was powerful, warlike, and ambitious, could not resist the temptation, and early in autumn he set sail with a formidable fleet, consisting of two hundred war-ships, and three hundred store-ships and vessels of smaller size. Having touched at the Orkneys, where he left his queen, and procured a large reinforcement of pirates and adventurers, Hardrada made for England and sailed up the Tyne, taking and plundering several towns. He then continued his course southwards, and, being joined by Tostig, sailed up the Humber and the Ouse. The Norwegian king and the Saxon traitor landed their united forces at Riccall, or Richale, not far from the city of York. Notwithstanding his former infamous conduct, Tostig had still some friends and retainers in that country: these now rallied round his standard, and many others were won over or reduced to an unpatriotic neutrality by the imposing display of force on the part of the invaders. The earls Morcar and Edwin, true to Harold and their trust, marched boldly out from York; but they were defeated after a desperate conflict, and compelled to fly. The citizens of York then opened their gates to the Norwegian conqueror, who made himself the more formidable to Harold by the wisdom and moderation of his conduct.

Through all the summer months the last of the Saxon monarchs had been busily engaged watching the southern coasts, where he expected William to land; but now, giving up for the moment every thought of the Normans, he united nearly all his forces and marched most rapidly to the north, to face his brother and the king of Norway. This march was so skilfully managed that the invaders had no notion of the advance, and they were taken by surprise when Harold burst upon them like a thunder-bolt in the neighbourhood of York a very few days after their landing. Hardrada drew up

his forces as best he could at Stamford Bridge: as he rode round them his horse stumbled, and he fell to the ground; but he presently sprang up unhurt, and, in order to stop a contrary augury, exclaimed, that this was a good omen. Harold saw what had happened, and inquired who that Norwegian chief was in the sky-blue mantle and with the splendid helmet. He was told that it was the king of Norway; upon which he added, "He is a large and strong person, but I augur that fortune has forsaken him." Before joining battle, Harold detached twenty mail-clad horsemen to parley with that wing of the enemy where the standard of Tostig was seen; and one of these warriors asked if Earl Tostig was there. Tostig answered for himself and said, "You know he is here!" The horseman then, in the name of his brother King Harold offered him peace and the whole of Northumbria; or, if that were too little, the third part of the realm of England. "And what territory would Harold give in compensation to my ally Hardrada, king of Norway?" The horseman replied, "Seven feet of English ground for a grave; or a little more, seeing that Hardrada is taller than most men."—"Ride back, ride back," cried Tostig, "and bid King Harold make ready for the fight! When the Northmen tell the story of this day they shall never say that Earl Tostig forsook King Hardrada the son of Sigurd. He and I have one mind and one resolve, and that is either to die in battle or to possess all England." Soon after, the action commenced: it was long, fierce, and bloody; but the victory was decisive, and in favour of Harold. Hardrada fell with nearly every one of his chiefs, and the greater part of the Norwegians perished. Tostig, the cause of the war, was slain soon after Hardrada. Even the Norwegian fleet fell into the hands of the conqueror, who had the generosity to permit Olave, the son of Hardrada, to depart with all the survivors in twenty-four ships, after that prince had sworn that he would for ever maintain faith and friendship to England.

Only three days after this signal victory the Normans landed in the south. Harold received this news as he was sitting joyfully at table in the good city of York; but, taking his measures with his usual rapidity, he instantly began his march towards London. Upon his way his forces, which had suffered tremendously in the battle against the Norwegians, were weakened by discontents and desertion; and not a few men were left behind by the velocity of his march, from the effects of their wounds and from sheer fatigue. In number, spirit, discipline, appointment, and in all other essentials, the enemies he had now to encounter were most formidable. They have well been called "the most remarkable and formidable armament which the western nations had seen, since some degree of regularity and order had been introduced into their civil and military arrangements."*

By the middle of August the whole of William's fleet, with the land-troops on board, had assembled at the mouth of the Dive, a small river which falls into the sea between the Seine and the Orne. The total number of vessels amounted to about 3000, of which 600 or 700 were of a superior order. During a whole month the winds were contrary, and kept the Norman fleet in that port. Then a breeze sprang up from the south, and carried the ships as far as St. Valery, near Dieppe; but there the weather changed; a storm set in, and they were obliged to cast anchor and wait for several days. During this delay some of the ships were wrecked and their crews drowned on the coast. In the forced idleness to which the soldiers were condemned, they passed their time in

* Sir J. Mackintosh, Hist. Eng.

A SHIP OF THE FLEET OF DUKE WILLIAM TRANSPORTING TROOPS FOR THE INVASION OF ENGLAND. Bayeux Tapestry.

talking, and in making melancholy reflections on the danger of the voyage and the difficulties of the whole enterprise,—so much had their uncomfortable situation abated their spirit. They began to murmur, that though there had been as yet no battle, many men had perished; and they calculated and exaggerated the number of dead bodies which the sea had thrown upon the sands. In consequence of all this not a few of the discouraged adventurers broke their engagements, and withdrew from the army; and the rest were inclined to believe that Providence had declared against the war. To check these feelings, which might have proved fatal to his projects, William caused the bodies of the shipwrecked to be privately buried as soon as they were found, and increased their rations both of food and strong drink. But their inactivity still brought back the same sad and discouraging ideas. "He is mad!" murmured the soldiers; "that man is very mad who seeks to take possession of another's country! God is offended at such designs, and this he shows now by refusing us a fair wind." The Duke then had recourse to something more potent than bread and wine. He caused the body of St. Valery, the patron of that place, where a town had grown up around his cell, to be taken from his shrine, and carried in procession through the camp, the knights, soldiers, camp-followers, and sailors all devoutly kneeling as it passed, and praying for the saint's intercession. In the course of the ensuing night the weather changed, and the wind blew fair from the Norman to the English coast. The troops repaired to their several ships, and, at an early hour the next morning, the whole fleet set sail. William led the van in a vessel which had been presented to him for the occasion by his wife Matilda, and which was distinguished by its splendid decorations in the day, and in the darkness of night by a brilliant light at its mast's head. The vanes of the ship were gilded,—its sails were of different bright colours,—the three lions, the arms of Normandy, were painted in several places,—and its sculptured figure-head was a child with a drawn bow, the arrow ready to fly against the hostile land. The consecrated banner sent from Rome by the Pope floated at the main-top-mast, and the invader had put a cross upon his flag, in testimony of the holiness of his undertaking. This ship sailed faster than all the rest, and, in his impatience, William neglected to order the taking in of sail to lessen its speed. In the course of the night he left the whole fleet far astern. Early in the morning he ordered a sailor to the mast-head to see if the other ships were coming up. "I can see nothing but the sea and sky," said the mariner; and then they lay-to. To keep the crew in good heart, William ordered them a sumptuous breakfast, with wines strongly spiced. The sailor was again sent aloft, and this time he said he could make out four vessels in the distance: but mounting a third time shortly after, he shouted, "Now I see a forest of masts and sails!" A few hours after this the united Norman fleet came to anchor on the Sussex coast without meeting with any resistance; for Harold's ships, which so long had cruised on that coast, had been called elsewhere, or had returned into port through want of pay and provisions.* It was on the 28th of September, 1066, that the Normans landed unopposed at a place called Bulverhithe, between Pevensey and Hastings. The archers landed first: they wore short dresses, and their hair was shaved off: then the horsemen landed, wearing iron casques and tunics and *chausses* (or defences for the thighs) of mail, being armed with long and strong lances and straight double-edged swords. After them descended the workmen of the army, pioneers, carpenters, and smiths, who carried on shore, piece by piece, three wooden castles, which had been cut and prepared beforehand in Normandy. The Duke was the last man to land; and as his foot touched the sand, he made a false step, and fell upon his face. A murmur instantly succeeded this trifling mishap, and the soldiery cried out, "God keep us! but here is a bad sign!" In those days the Conqueror's presence of mind never forsook him, and, leaping gaily to his feet, and showing them his hand full of English earth or sand, he exclaimed, "What now? What astonishes you? I have taken seisin of this land with my hands, and by the splendour of God as far as it extends it is mine,—it is yours!"

From the landing-place the army marched to Hastings, near to which town he traced a fortified camp, and set up two of the wooden castles or towers that he had brought with him from Normandy, and there placed his provisions. De-

Orders given for the Erection of a fortified Camp at Hastings. Bayeux Tapestry.

tached corps of Normans then overran all the neighbouring country, pillaging and burning the

* Thierry.—Southey's Naval Hist. of Eng.—Chron. de Normand.—Guil. Pictav.

houses. The English fled from their abodes, concealed their goods and their cattle, and repaired in crowds to their churches, which they believed the surest asylum against their enemies, who, after all, were Christians like themselves. But the Normans cared little for the sanctity of English churches, and respected no asylum. William personally surveyed all the neighbouring country, and occupied the old Roman castle of Pevensey with a strong detachment. It should appear that he was presently welcomed into England by several foreigners, the remnant of the old Norman court party which had been so predominant in the days of the late king. One Robert, a Norman thane who was settled in the neighbourhood of Hastings, is particularly mentioned as giving him advice immediately after his landing. It is probable that the disembarking the army, horse and foot, and the landing of the provisions and military stores, would occupy two or three days; but sixteen days elapsed between their arrival and the battle, and in all that time William made no advance into the country, but lingered within a few miles of the coast where he had landed.

COOKING AND FEASTING OF THE NORMANS AT HASTINGS. Bayeux Tapestry.

On reaching London, where he appears to have been well received by the people, Harold manned 700 vessels, and sent them round to hinder William's escape—for he made no doubt of vanquishing the Normans, even as he had so recently vanquished the Norwegians. Reinforcements of troops came in from all quarters except from the north; and another of his Norman spies and advisers, who was residing in the capital, informed the Duke there were grounds for apprehending that in a few days the Saxon army would be swelled to 100,000 men. But Harold was irritated by the ravages committed in the country by the invaders; he was impatient to meet them, and hoping to profit a second time by a sudden and unexpected attack, he marched off for the Sussex coast by night, only six days after his arrival in London, and with forces inferior in numbers to those of William. The camp of William was well guarded, and, to prevent all surprise, he had thrown out advanced posts to a considerable distance. These posts, composed of good cavalry, fell back as the Saxons approached, and told William that Harold was rushing on with the speed and fury of a madman. On his side Harold despatched some spies, who spoke the French language, to ascertain the position and state of preparation of the Normans. Both these the returning spies reported to be formidable, and they added, with astonishment, that there were more priests in William's camp than there were soldiers in the English army. These men had mistaken for priests all the Norman soldiers that had short hair and shaven upper lips; for it was then the fashion of the English to let both their hair and their mustaches grow long. Harold smiled at their mistake, and said, "Those whom you have found in such great numbers are not priests, but brave men of war, who will soon show us what they are worth." He then halted his army at *Senlac*, since called Battle, and changing his plan, surrounded his camp with ditches and palisades, and waited the attack of his rival in that well-chosen position. One whole day was passed in fruitless negotiations, the nature of which is differently reported by the old chroniclers. According to William of Poictiers, who was chaplain to the Conqueror, and had the best means of information, and the writer or writers of the Chronicle of Normandy, a monk named Hugh Maigrot was despatched to demand from Harold, in the name of William, that he would do one of three things—resign his crown in favour of the Norman; submit to the arbitration of the pope; or decide the quarrel by single combat. Harold sent a refusal to each of these proposals, upon which William charged the monk with this last message: "Go, and tell Harold, that if he will keep his old bargain with me, I will leave him all the country beyond the river Humber, and will give his brother Gurth all the lands of his father, Earl Godwin: but if he obstinately refuse what I offer him, thou wilt tell him, before all his people, that he is perjured, and a liar; that he and all those who shall support him are excommunicated by the pope, and that I carry a bull to that effect." The Norman Chronicle says that the monk Hugh pronounced this message in a solemn tone, and at the word 'excommunication,' the English chiefs gazed upon one another in great dismay; but that, nevertheless, they all resolved to fight to the last, well knowing that the Norman had

Hastings from the Fairlight Downs.

promised their lands to his nobles, his captains, and his knights, who had already done homage for them.

The Normans quitted Hastings, and occupied an eminence opposite to the English, plainly showing that they intended to give battle on the morrow. Several reasons had been pressed upon Harold by his followers, and were now repeated, why he should decline the combat, or absent himself from its perilous chances. It was urged, that the desperate situation of the duke of Normandy forced him to bring matters to a speedy decision, and put his whole fortune on the issue of a battle, for his provisions were already exhausted, and his supplies from beyond sea would be rendered precarious both by the storms of the coming winter and the operations of the English fleet, which had already blockaded all the ships William kept with him in the ports of Pevensey and Hastings; but that he, the king of England, in his own country, and well provided with provisions, might bide his own time, and harass with skirmishes a decreasing enemy, who would be exposed to all the discomforts of an inclement season and deep miry roads; that if a general action were now avoided, the whole mass of the English people, made sensible of the danger that threatened their property, their honour, and their liberties, would reinforce his army from all quarters, and by degrees render it invincible. As he turned a deaf ear to all these arguments, his brother Gurth, who was greatly attached to him, and a man of bravery and good counsel, endeavoured to persuade him not to be present at the action, but to set out for London, and bring up the levies, while his best friends should sustain the attack of the Normans. "Oh! Harold," said the young man, "thou canst not deny, that either by force or free-will, thou hast made Duke William an oath upon the body of saints; why, then, adventure thyself in the dangers of the combat with a perjury against thee? To us, who have sworn nothing, this war is proper and just, for we defend our country. Leave us, then, alone to fight this battle—thou wilt succour us if we are forced to retreat, and if we die thou wilt avenge us." To this touching appeal Harold answered, that his duty forbade him to keep at a distance whilst others risked their lives; and, determined to fight, and full of confidence in the justice of his cause, he waited the morrow with his usual courage. The night was cold and clear: it was spent very differently by the hostile armies; the English feasted and rejoiced, singing, with a great noise, their old national songs, and emptying their horn-cups, which were well filled with beer and wine: the Normans having looked to their arms and to their horses, listened to their priests and monks, who prayed and sung litanies; and, that over, the soldiers confessed themselves, and took the sacrament by thousands at a time.

The day of trial—Saturday, the 14th of October—was come. As day dawned, Odo, the bishop of Bayeux, a half-brother of Duke William, celebrated mass, and gave his benediction to the troops, being armed the while in a coat of mail, which he wore under his episcopal rochet: and when the mass and the blessing were over, he mounted a war-

horse, which the old chroniclers, with their interesting minuteness of detail, tell us was large and white, took a lance in his hand, and marshalled his brigade of cavalry. The whole army was divided into three columns of attack; the third column, composed of native Normans, and including many great lords and the choicest of the knights, being headed by the duke in person. William rode a fine Spanish horse, which a rich Norman had brought him on his return from a pilgrimage to the shrine of St. Iago of Galicia: he wore suspended round his neck some of those revered relics upon which Harold had sworn, and the standard blessed by the pope was carried at his side by one Tonstain, surnamed "the White," or "the Fair,"* who accepted the honourable but dangerous office, after two Norman barons had declined it. Just before giving the word to advance, he briefly addressed his collected host—"Make up your minds to fight valiantly and slay your enemies. A great booty is before us;—for if we conquer we shall all be rich; what I gain, you will gain; if I take this land, you will have it in lots among you. Know ye, however, that I am not come hither solely to take what is my due, but also to avenge our whole nation, for the felonies, perjuries, and treachery of these English. They massacred our kinsmen the Danes—men, women, and children,—on the night of St. Brice; they murdered the knights and good men who accompanied Prince Alfred from Normandy, and made my cousin Alfred expire in torture. Before you is the son of that Earl Godwin who was charged with these murders. Let us forward, and punish him, with God to our aid!"

A gigantic Norman, called Taillefer, who united the different qualities of champion, minstrel, and juggler, spurred his horse to the front of the van, and sung, with a loud voice, the popular ballads which immortalized the valour of Charlemagne, and Roland, and all that flower of chivalry that fought in the great fight of Roncesvalles. As he sang he performed feats with his sword, throwing it into the air with great force with one hand, and catching it again with the other. The Normans repeated the burden of his song, or cried *Dieu aide! Dieu aide!* This accomplished bravo craved permission to strike the first blow: he ran one Englishman through the body, and felled a second to the ground; but in attacking a third cavalier he was himself mortally wounded. The English, who, in reply to the *Dieu aide!* or "God is our help!" of the Normans, shouted "Christ's rood!—the holy rood!" remained in their position on the ridge of a hill fortified by trenches and palisades; and within these defences they were marshalled after the fashion of the Danes, shield against shield, presenting an impenetrable front to the enemy. According to old privilege, the men of Kent were in the first line, and the burgesses of London had the honour of being the body guard, and were drawn up close round the royal standard. At the foot of this banner stood Harold, with his two brothers, Gurth and Leofwin, and a body of the bravest thanes of England. The Normans attacked along the line with their bowmen and crossbowmen, who produced no impression; and when their cavalry charged, the English, in a compact body, received the assailants with battle-axes, with which they broke the lances and cut the coats of mail, on which the Normans relied. The Normans, despairing of forcing the English palisades and ranks, retired in some disorder to the division where William commanded in person. The duke then threw forward all his archers, and supported them by a charge of cavalry, who shouted, as they couched their lances, "*Notre Dame! Notre Dame! Dieu aide! Dieu aide!*" Some of this cavalry broke through the English line, but presently they were all driven back to a deep trench artfully covered over with brushes and grass, where horses and riders fell in *pêle-mêle*, and perished in great numbers. According to

* The readers of Marmion will remember the brave bearing of "Stainless Tunstall's banner white," long after in the fight of Flodden.

DUKE WILLIAM ADDRESSING HIS SOLDIERS ON THE FIELD OF HASTINGS. Bayeux Tapestry.

some accounts more Normans fell here than in any other part of the field. For a moment there was a general panic: a cry spread that the duke was killed, and at this report a flight commenced. William threw himself before the fugitives, and stopped their passage, threatening them and striking them with his lance; then, uncovering his face and head, he cried, "Here I am! look at me! I am still alive, and I will conquer by God's help." In another part of the field the rout was stopped by the fierce Bishop of Bayeux, and the attacks on the English line were renewed and multiplied. From nine in the morning till three in the afternoon the successes were nearly balanced, or, if anything, seemed rather to preponderate on the English side. William had expected the greatest advantage from the charges of his numerous and brilliant cavalry; but the English foot stood firm (a thing which infantry seldom did in those days under such circumstances), and they were so well defended by their closed shields, that the arrows of the Normans had little effect upon them. The duke then ordered his bowmen to alter the direction of their shafts, and, instead of shooting point-blank, to direct their arrows upward, so that the points should come down like hail from above upon the heads of the enemy. The manœuvre took effect, and many of the English were wounded, most of them in the face; but still they stood firm, and the Normans, almost disheartened, had recourse to a stratagem. William ordered a thousand horse to advance, and then turn and fly; at the view of this pretended rout the English lost their coolness, and leaving their positions, a part of the line gave pursuit with their battle-axes slung round their necks. At a certain distance a fresh corps of Normans joined the thousand horse, who drew rein and faced about; and then the English, surprised in their disorder, were assailed on every side by lances and swords. Here many hundreds of the English fell; for, encompassed by horse and foot, they could not retreat, and they would not surrender. The latter

Battle of Hastings. Bayeux Tapestry.

word, indeed, is never once used in any of the many old accounts of the battle of Hastings. The Norman writers speak with admiration of the valour of several of Harold's thanes, who fought single-handed against a host of foes, as though each of them thought to save his country by his individual exertions. They have not preserved his name, but they make particular mention of one English thane, armed with a battle-axe, who spread dismay among the invaders. The battle-axe appears to have been the arm chiefly used by the English. This ponderous weapon had its advantages and its disadvantages; wielded by nervous men, it brake in pieces the coats of mail, and cleft the steel casques of the Normans, as no swords could have done; but from its weight and size it required both hands to wield it, and it was awkward and difficult to manage in close combat.

Battle of Hastings. Bayeux Tapestry.

The feint flight, which had succeeded so well, was repeated by the Normans in another part of the field, and, owing to the impetuosity of the English, with equal success. But still the main body maintained its position behind its stakes and palisades on the ridge of the hill; and such was their unshaken courage, that the Normans were obliged to try the same stratagem a third time;—and a third time the brave but imprudent victims fell into the snare. Then the Norman horse and foot burst into the long-defended enclosure, and broke the English line in several points. But even now the English closed again round Harold, who, throughout the day, had shown the greatest activity and bravery. At this juncture he was struck by an arrow, shot at random, which entered his left eye, and penetrated into his brain. The English then gave way, but they retreated no further than their standard, which they still sought to defend. The Normans hemmed them in, making the most desperate efforts to seize the banner. Robert Fitz-Ernest had almost grasped it, when a battle-axe laid him low for ever. Twenty Norman knights then undertook the task, and this attempt succeeded, after ten of their number had perished. The standard of England was then lowered, and the consecrated banner, sent from Rome, raised in its stead, in sign of victory. Gurth and Leofwin, the brave brothers of Harold, died at that last rallying point. The combat had lasted nine hours, for it was now six o'clock in the evening, and the sun was setting. After a desperate attempt at rallying made by the men of Kent and the East Angles, which cost the lives of many of the victors, the English troops, broken and dispirited by the loss of their leader, dispersed through the woods which lay in the rear of their position: the enemy followed them by the light of the moon; but, as they were ignorant of the country, which was in some places intersected by ditches, and as the English turned and made a stand wherever they could, they suffered severely in this pursuit, and soon gave it up. In every clause of their narrative the Norman writers express their admiration of the valour of the foe; and most of them confess that the great superiority of his forces alone enabled William to obtain the victory. During the sanguinary conflict the fortunate duke had three horses killed under him, and at one moment he was nearly laid prostrate by a blow struck upon his helmet by an English cavalier. The proud band of lords and knights that followed him from the continent was fearfully thinned, as was well proved on the morrow, when the muster-roll he had prepared before leaving the port of St. Valery was called over. He lost one-fourth of his army, and he did not gain by the battle of Hastings a fourth part of the kingdom of England; for many an after-field was fought, and his wars for the conquest of the west, the north, and the east, were protracted for seven long years. The conquest effected by the Normans was a slow, and not a sudden one.* "Thus," to use the energetic language of an old writer,† "was tried by the great assize of God's judgment in battle, the right of power between the English and Norman nations; a battle the most memorable of all others; and howsoever miserably lost, yet most nobly fought on the part of England."

* Sir J. Mackintosh, Hist. † Daniel.

DEATH OF HAROLD. Bayeux Tapestry.

IN the preceding narrative we have seen the Saxons frequently engaged in wars, and occasionally also connected by alliances, with various other nations dwelling around them in the same island. The largest as well as the fairest portion of Britain was conquered and occupied during the period we have been reviewing by these Germanic invaders; but much of it still remained in the possession of the races of other lineage, by whom it had been earlier colonized, or was seized upon by invaders like themselves, but from a different quarter. All the east and south, from the Channel

to the Tweed, was Saxon; in the west, along the whole extent of the Saxon dominion, were the alien and generally hostile tribes of Cornwall and Wales; on the north-west were the independent sovereignties of Cumbria and Strathclyde (if these were really two distinct kingdoms); and to the east and north of these was the powerful and extensive kingdom of the Picts, originally, it should seem, embracing the whole of the rest of modern Scotland. Behind the Picts, however, in the north-west, a colony of Scots from Ireland, not long after the arrival of the Saxons in the south, founded another new power of foreign origin, destined in like manner in course of time to bear down before it the elder thrones of its own part of the island.

The doubtful and confused annals of the several Cornish and Welsh principalities of those times offer nothing to detain the historian. Cornwall appears to have usually formed one kingdom, South Wales another, and North Wales a third. But the subjects of these several states, and also those of Cumbria and Strathclyde, farther to the north, may be regarded as having been in the main one people. It seems not improbable that they may have been a mixture of the old Celtic Britons who fled before the Saxons, or were the original inhabitants of this strip of country, and of Cimbrians originally from the north of Germany and Denmark, the proper progenitors of the present Welsh. At what date these Cimbrians first found their way from the east coast of Scotland, where they seem to have earliest settled, to the west coast of England, and there mixed with and established a dominion over the native British occupants, no chronicles have told us. But some ancient relation between the Welsh and the Picts seems to be indicated by the strong evidence of language; and the close connexion that subsisted between Wales and the Scottish kingdom of Strathclyde, down to the extinction of the latter, is established by abundance of historic testimony. If, in the mixture of the two races, the ascendancy remained with the Celtic Britons anywhere, it was most probably in Cornwall. Everywhere else both the government and the language appear to have become chiefly Cimbrian, the national denomination of the Welsh in their vernacular tongue to this day. One of the northern Welsh kingdoms was actually called the kingdom of Cumbria, whence our modern county of Cumberland; and if the kingdom of Strathclyde was a different state from this (which is doubtful), we know at least that in that district of Scotland also, the native land and residence of Merlin and Aneurin, and many other personages famous in Cumbrian song and story, the language, and government, and all things else, were Welsh.

At what time the various tribes of the north, often spoken of under the general appellation of the Caledonians, although that name was properly applicable only to the occupants of the woody and mountainous regions of the west and north-west, came to be united in the single monarchy of the Picts, it is impossible to ascertain. The Picts are first mentioned about the beginning of the fourth century, at which time the name appears to have been understood to comprehend all the northern tribes. Antiquaries are generally agreed that a kingdom under the name of the kingdom of the Picts, which, in pretension at least, extended over the whole of what is now called Scotland, with the exception of the district of Strathclyde in the south-west, had been established some considerable time before the evacuation of South Britain by the Romans in the middle of the fifth century. Records, the authenticity of which does not admit of any reasonable doubt, make the Pictish sovereign, when the event took place, to have been Durst, the son of Erp, for whom his warlike achievements against the provincialized Britons of the south, and the length of his reign, have obtained from the Irish annalists the poetic title of King of a Hundred Years and a Hundred Battles. The Picts, as our preceding pages have already informed the reader, came into collision with the Saxons of Northumberland not long after the establishment of the two kingdoms of Deira and Bernicia, the princes of the latter of which appear to have claimed as within their boundaries the whole of the territory along the east coast as far as to the Frith of Forth. For some time, accordingly, all this district formed a sort of debateable land, alternately subject to the Northumbrian Saxons and to the Picts. The Saxons are believed to have begun to settle in the territory as early as the middle of the fifth century, and probably from this date the population continued to be mainly Saxon; but after the great battle of Dunnechtan (supposed to be Dunnichen in Angus), fought in 685 between the Pictish king Bridei, the son of Beli, and the Northumbrian Egfrid, it became permanently a part of the Pictish dominions. This is the tract of country which in a later age came to be called by the name of Lodonia, or Laodonia, still surviving in the Lothians, the modern designation of the greater part of it. Lodonia appears to be a Teutonic word, signifying the Marches or Borders.

In the earliest times of the Pictish monarchy its capital appears to have stood near the present town of Inverness. It was here that king Bridei, or Brude, son of Merlothon, was visited soon after the middle of the sixth century by St. Columba. Afterwards, on the extension of their power towards the south, the kings of the Picts transferred their residence to Forteviot in Perthshire, and here they seem to have fixed themselves so long as the monarchy subsisted. The history of the state, so far as it has been preserved, is made up of little else than a long succession of hostilities, sometimes with the Saxons, sometimes with the neighbouring kingdom of Strathclyde, sometimes with the Scots from Ireland, who from the commencement of the sixth century continued to encroach upon the territories of the Picts, and the pressure from whom perhaps had some

share in inducing the latter eventually to remove the chief seat of their sovereignty from its ancient position in the heart of the true Caledonia. The meagre narrative is also varied by some domestic wars, principally arising out of the competition of various claimants for the crown, to which there seems to have been no definitely settled rule of succession. Bede tells us that a preference was usually given to the female line,—that is to say, the brother of the deceased sovereign by the same mother, or his uncle, who was the son of his grandmother, was preferred to his own son. This practice, which still prevails among many barbarous tribes, was probably conceived to be recommended by the double advantage of better securing the purity of the blood royal, and at the same time, of generally providing a man of mature age, instead of a boy or a child, to fill the vacant throne. In the end of the eighth and the beginning of the ninth century the Picts found a new enemy in the northern pirates or sea-kings, the same marauders who in the same age ravaged the neighbouring coasts of England and France, and indeed it may be said generally of all the north-west of Europe. The dissolution of the ancient Pictish royalty, however, and the extinction of the name of the Picts as that of an independent people, were now at hand.

The earliest colony of Irish, or Scots, as they were called, is said to have settled on the west coast of North Britain about the middle of the third century. They were led by Carbry Riada, prince or sub-regulus of a district called Dalriada in Ulster; and they were long known by the name of the Dalriadians, from this their native seat. The Dalriadians, however, do not appear to have set up any pretences to an independent sovereignty in the country of their adoption until after the beginning of the sixth century, when their numbers were greatly augmented by an immigration of their Irish kindred, under the conduct of Lorn, Fergus, and Angus, the three sons of Erck, the then prince of Dalriada. This new colonization seems to have amounted to an actual invasion of North Britain, and the design of its leaders probably was from the first to wrest the country or a part of it from its actual possessors. Very soon after this we find the Picts and Scots meeting each other in arms. A still more decided proof of the growing strength of the latter nation is, in course of time, afforded by a matrimonial alliance between the king of the Dalriadians and the Pictish royal house. This connexion took place in the reign of Achaius, who is reckoned the twenty-seventh of the Scottish kings from Fergus, in whose line and in that of the descendants of his elder brother, Lorn, the sovereign power had been all along preserved. Achaius married Urgusia, the sister of the Pictish kings Constantine and Ungus, who reigned in succession from A.D. 791 to 830. The issue of this marriage, and the successor of Achaius, was Alpin, and his son and successor was Kenneth II., who mounted the throne of his ancestors in the year 836. Three years after, the Pictish king Uven, the son and successor of Ungus, fell in battle with the Danes. Kenneth, as the near relation of its deceased occupier, immediately claimed the vacant throne: a contest of arms between the two nations appears to have ensued; but at last, in A.D. 843, Kenneth, having subdued all opposition, was acknowledged king both of the Scots and the Picts. There is no reason to suppose, as is asserted by some of the Scottish chroniclers who wrote in a comparatively recent age, that the Pictish people were upon this event either destroyed or driven from their country; it is probable enough that the chiefs of the faction that had resisted the claim of Kenneth, and also perhaps many of their followers, may have fled from the vengeance of the conqueror, and taken refuge in the Orkney islands and elsewhere; but the great body of the inhabitants no doubt remained the subjects of the new king. It appears that Kenneth and his immediate successors styled themselves, not kings of Scotland and of Pictavia or Pictland, but kings of the Scots and the Picts; and the Picts are spoken of as a distinct people for a century after they thus ceased to form an independent state.*

Meanwhile the kingdom of Strathclyde, the capital of which was Alcluyd, the modern Dunbarton, still subsisted, and withheld a large portion of the present Scotland from the sway of the Dalriadian prince. There is some appearance of Kenneth Mac Alpin having attempted to possess himself of that additional throne by the same combination of policy and force by which he had acquired the dominion of the Picts. After long fighting, he concluded a peace with Cu or Caw, the king of Strathclyde, and gave him his daughter in marriage. No opportunity, however, was found of turning this arrangement to account in the manner which its projector probably contemplated; and the kingdom of Strathclyde, though distressed and weakened both by the pressure of its powerful neighbour and the frequent predatory and devastating attacks of the Danes from beyond seas, con-

* The account here given is that which is now generally received; but it is proper to notice that the whole story of the conquest of the Picts by Kenneth, and also Kenneth's extraction from the old royal line of the Irish Scots, have been called in question and denied by Pinkerton in his "Enquiry into the History of Scotland preceding the reign of Malcolm III.," a work of much learning and acuteness, and also of great value for the quantity of materials collected in it from previously unexplored sources, but disfigured by many precipitate assertions and a pervading spirit of prejudice and paradox. The author founds his scepticism as to the events mentioned in the text principally upon the silence of certain contemporary authorities. He admits it to be "clear, however, that the opinion that Kenneth vanquished the Picts is as old as the eleventh century." (Enquiry, ii. 152, Edit. of 1814.) He conceives it to be more probable that the Picts subdued the Scots, than the Scots the Picts; but on the whole is persuaded that all that really took place was a union on equal terms between the two nations. Then, to account upon this hypothesis for the unquestionable fact that the whole territory fell under the dominion of Kenneth Mac Alpin, he conceives that Kenneth and his father Alpin were not descendants of the old Dalriadic kings at all, but of a new line of Pictish princes that had been imposed upon the Dalriadians by the Picts about a century before this first amalgamation of the one people with the other. An assumption so gratuitous as this last, and so directly opposed to the uniform testimony of chronicles and records, it is quite impossible to admit. In our abstract we have principally adhered to the dates and order of events as settled by the latest investigator of this part of our national history, Chalmers, in his Caledonia, i. pp. 374—428.

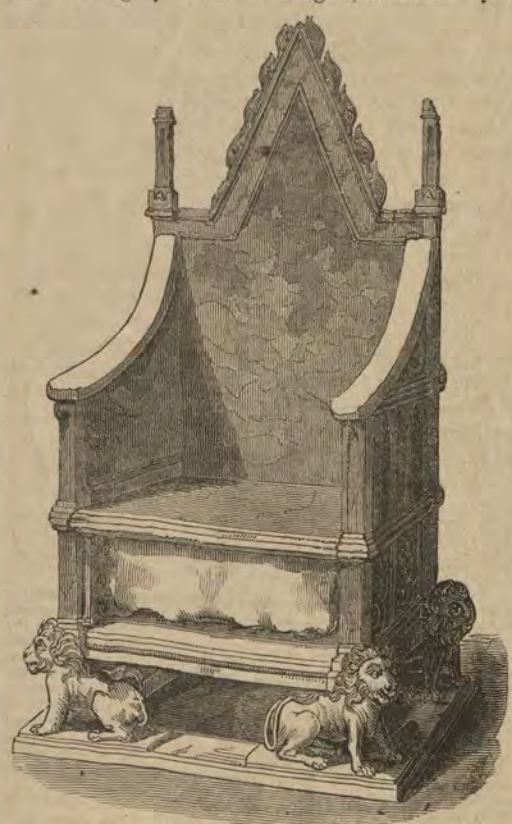
tinued to maintain a nominal independence till the native government was finally subverted, and the country incorporated with the rest of the Scottish dominions, by the defeat of its last king, Dunwallon, by Kenneth III., the king of the Scots (the great-great-grandson of Kenneth Mac Alpin), at the battle of Vacornar, in A.D. 973. Even before this event, however, North Britain had begun to be known, after its Irish conquerors, by the name of Scotland. It is so called for the first time in the Saxon Chronicle under the year 934.

Meanwhile the united Scottish kingdom founded by Kenneth Mac Alpin continued to consolidate and strengthen itself under the sway of his descendants. Kenneth himself, in the remaining part of his reign, had to make good his position by his sword, sometimes in defensive, sometimes in aggressive contests, both with the Danes, the Saxons, and his neighbours of Strathclyde; but he died at last in bed at his capital of Forteviot, A.D. 859. He was succeeded by his brother Donald III., who reigned till A.D. 863. Constantine II., the son of Kenneth, followed, and, during a reign of eighteen years, was engaged in almost uninterrupted warfare with the Danes, who harassed him both from Ireland and from the Continent, and penetrated into the heart of the kingdom by all its maritime inlets,—by the Clyde from the west, and by the Friths of Moray, Tay, and Forth from the east. It is asserted by the old historians that these invaders were first called in by the fugitive or subjugated Picts, a fact which may be taken as some confirmation of the common northern origin of both. The enemy, therefore, with whom Constantine had to contend had friends and supporters in the heart of his dominions; and while he endeavoured to repel the foreigners with one hand, he must have had to keep down his own subjects with the other. Nor were the Picts altogether defrauded of their revenge on the son of their conqueror. They and their allies the Danes appear to have wrested from the Scottish king not only the Orkney and Western islands, but also the extensive districts of Caithness, Sutherland, and part of Ross-shire, on the continent of Scotland; and these acquisitions continued to be governed for many ages by Norwegian princes entirely independent of the Scottish crown. The traditionary ac-

Sculptured Stone lately dug up in the ancient chapel of St. Regulus, at St. Andrew's. This is given as a specimen of many stones of a similar kind which are found in various places along the east coast of Scotland, where the Pictish dominions lay. The present stone has not been before engraved, and is, besides, remarkable as being, we believe, the only specimen of these stones which has been found to the south of the Tay. In the county of Angus, on the other side of that river, they are very numerous; and they have been found as far north as the county of Sutherland. As this range of country constituted the principal part of the dominions of the Picts, they have generally been supposed to be monuments of that people. But all sorts of conjectures have been formed respecting them: and both the people by whom, and the age in which they were erected, must be considered as still remaining undiscovered. While some antiquaries have been disposed to refer them chiefly to the ninth and the two or three following centuries, and to connect them with the events of the Danish invasions of those times; others have carried them back to the age in which the famous King Arthur is supposed to have flourished, with whose history and exploits, real or mythological, some of them are certainly connected in the popular traditions. Notwithstanding the figure of the cross, which is not unfrequently found on these shores, it must be considered doubtful if they are Christian memorials; for that symbol is undoubtedly more ancient than Christianity. A very remarkable circumstance is, that various oriental figures, the elephant especially, appear in several instances among their decorations. The serpent is also not an unusual figure. In one instance only, as far as we are aware, has any inscription in literal, or apparently literal characters, been found—namely, on one of two stones discovered a few years ago at Pitmachie, in Aberdeenshire, and engraved in the last (1814) edition of Pinkerton's 'Inquiry into the Early History of Scotland.' "The characters," Mr. Pinkerton observes, "seem to resemble the Anglo-Saxon, as published by Hickes, especially those on the coins of the kings of Northumbria of the ninth century."

count, repeated by the later historians, of the termination of Constantine's disastrous reign is, that he was killed in a battle with the Danes, or put to death by them immediately after the battle, near Crail, in Fife. A cave in which he was massacred is still shown, and called the Devil's Cave. The older writers, however, place his death in A.D. 882, a year after the great battle in Fife.

Constantine's immediate successor was his brother Hugh; but he was dethroned the same year by Grig, the chieftain of the district now forming the shires of Aberdeen and Banff, who, associating with himself on the throne Eocha, or Eth, son of the king of Strathclyde by a daughter of Kenneth Mac Alpin, is said to have reigned for about twelve years with a more extensive authority than had been enjoyed by any of his predecessors. The monkish chroniclers, indeed, who designate him by the pompous title of Gregory the Great, absurdly make him not only to have held his own with a strong hand, but to have actually reduced to subjection all the neighbouring states, including both the English and the Irish. He appears to have been a favourer of the church, upon which he probably leant for support in the deficiency of his hereditary title. However, he and his partner in the sovereignty were at length dethroned by a popular insurrection, A.D. 893; on which their place was supplied by Donald IV., the son of Constantine II. A succession of combats with the Danes, again, one of the most memorable of which was fought at Collin, near Scone, for the possession of the famous Stone of Destiny which Kenneth Mac Alpin had transferred thither from the original British nestling-place of his antique race in Argyleshire, form almost the only recorded events of his reign. The northern invaders were beaten at Collin; but a few years after, in 904, Donald fell in fight near Forteviot, against another band of them from Ireland. He was succeeded by Constantine III., the son of his uncle Hugh. This was the Scottish king who, as related in a preceding page, made an inroad, in 937, into the dominions of the Saxon Athelstane in conjunction with Olave or Anlaf, the Danish chief of Northumberland, when their united forces were routed in the bloody day of Brunanburgh, and Constantine with difficulty escaped from the slaughter in which his eldest son fell. A few years after this humiliating defeat, in A.D. 944, he exchanged his crown for a cowl, and he passed the last eight or nine years of his life as Abbot of the Culdees of St. Andrews. Meanwhile the throne was ascended by Malcolm I., son of Donald IV. The most important event of this reign was the cession by the Saxon king Edmund of the district of Cumbria, which he had recently conquered from its last king Dunmail, to Malcolm, to be held by him on condition of his arming when called upon in the defence either of that or of any other part of the English territory. Cumberland remained an appanage of the Scottish crown from this time till 1072, when it was recovered by William the Conqueror.



CORONATION CHAIR OF THE KINGS OF ENGLAND, KEPT IN WESTMINSTER ABBEY. Beneath the seat is the "Stone of Destiny," carried off from Scone by Edward I., in 1296.

Malcolm I. came to a violent death at the hands of some of his own subjects in 953, and left his sceptre to Indulf, the son of his predecessor Constantine III. The reign of Indulf was grievously troubled by repeated attacks of the Northmen; and he at last lost his life in what the old writers call the Battle of the Bauds, fought in 961, near the Bay of Cullen, in Banffshire, where several barrows on a moor still preserve the memory of the defeat of the foreigners. Duff, the son of Malcolm I., now became king, according to what appears to have been the legal order of succession at this time, when each king for many generations was almost uniformly succeeded not by his own son, but by the son of his predecessor. But the effects of the natural disposition of the sovereign in possession to retain the succession exclusively in his own line now began to show themselves; and the right of Duff was disputed from the first by Indulf's son Culen, whose partizans, although defeated in the fair fight of Duncrub, in Perthshire, are asserted to have afterwards opened the way to the throne for their leader by the assassination of his rival. This event took place at Forres in 965. But Culen did not long retain his guiltily acquired power. Disregarding all the duties of his place,

he abandoned himself to riot and licentiousness, and soon followed up the murder of Duff by an act of atrocious violence, committed on another near relation, the daughter of the king of Strathclyde. The nation of the injured lady took arms against her violator; and Culen fell in a battle fought with them at a place situated to the south of the Forth in A.D. 970.

The crown now fell to Kenneth III., another son of Malcolm I., and the brother of Duff. The reign of Kenneth III. is one of the most important in the early history of Scotland. He was a prince of remarkable ability, and of a daring and unscrupulous character; he occupied the throne for a sufficient length of time to enable him to lay a deep foundation for his schemes of policy, if not to carry them into complete effect; and he came at a crisis when the old order of things was naturally breaking up, and the most favourable opportunity was offered to a bold and enterprising genius like his of establishing, or at least originating, a new system. It was one of those conjunctions of circumstances and of an individual mind fitted to take advantage of them, by which most of the great movements in national affairs have been produced. His first effort was to follow out the war with the declining state of Strathclyde until he wound it up, as has been intimated above, with the complete subjugation of that rival kingdom and its incorporation with his hereditary dominions. With the exception, therefore, of the nominal independence, but real vassalage in everything except in name, of the Welsh, the whole of Britain was now divided into the two sovereignties of England and Scotland. The Saxon power of Wessex had swallowed up and absorbed everything else in the south, and in the north every other royalty had in like manner fallen before that of the Celtic princes of Dalriada. Peace and intimate alliance, also, had now taken place of the old enmity between the two monarchies; and an opening must have been made for the passage to Scotland of some rays from the superior civilization of her neighbour, which would naturally be favourable to imitation in the arrangements of the government as well as in other matters. It was in this position of affairs that Kenneth proceeded to take measures for getting rid of what we have seen was the most remarkable peculiarity of the Scottish regal constitution, the participation of two distinct lines in the right of succession to the throne, a rule or custom to which, notwithstanding some advantages, there would seem to exist an all-sufficient objection in its very tendency to excite to such attempts as that which Kenneth now made. Kenneth's mode of proceeding was characteristically energetic and direct. To put an end in the most effectual manner to the pretensions of Malcolm, the son of his brother Duff, he had that prince put to death, although he had been already recognized as Tanist, or next heir to the throne, and had as such been invested, according to custom, with the lordship of Cumberland. We shall see, however, that this deed of blood was after all perpetrated to no purpose. Another of Kenneth's acts of severity, and perhaps also of cruelty and vengeance, recoiled upon him to his own destruction. After the suppression of a commotion in the Mearns, he had thought it necessary to signalize the triumph of the royal authority by taking the life of the only son of the chief of the district, either because the young man had been one of the leaders of the vanquished faction, or perhaps because his father had not shown sufficient energy in meeting and putting down their designs. By some means or other, however, Kenneth was some time after induced to trust himself in the hands of Fenella, the mother of his victim, by visiting her in her castle near Fettercairn. Here he was murdered either by her orders, or not improbably by her own hands, for it is related that she fled the instant the deed was done, although she was soon taken, and suffered the same bloody death she had avenged and inflicted. The reign of Kenneth was thus terminated A.D. 944.

We ought not to omit to notice that it was in the early part of this reign that the Danes were defeated in the great battle of Luncarty, near Perth, still famous in Scottish story and tradition for what we fear must be designated the fable of the origin of the nobility of the Hays Earls of Errol, from the incident of their ancestor, a husbandman, who chanced to be busy at work in a neighbouring field, having, accompanied by his two sons, armed only with their ploughbeams, opposed a chief division of their countrymen when flying from the fight in a moment of panic, and driven them back to victory. The armorial bearing of this ancient family, which exhibits three escutcheons, supported by two peasants, carrying each the beam of a plough on his shoulder, is appealed to in proof of the story; but it is just as likely that the story may have been invented to explain the arms. At all events the arms are of much less antiquity than the battle of Luncarty, at the date of which event armorial ensigns were unknown. It is well established that the Hays are a branch of the Norman De Hayas, whose ancestor came over to England with the Conqueror,—that they did not come to Scotland till more than a hundred years after the battle of Luncarty,—and that they only obtained the lands of Errol from King William the Lion of Scotland, about the middle of the twelfth century. It was not till the middle of the fourteenth century that they were ennobled.

The throne left vacant by the death of Kenneth appears to have been contested from the first by three competitors. Of these, a son of Culen, under the name of Constantine IV., is regarded as having been first crowned; but, within a year, he fell fighting against one of his rivals, a son of King Duff, and younger brother of the murdered Prince Malcolm, who immediately assumed the sovereignty as Kenneth IV. The Scottish chroniclers call him Kenneth the Grim. There was still, however, another claimant to the succession of Kenneth III., Malcolm, the son of that king, whom his father

had designed to be his heir, and invested as such with the principality of Cumberland after the violent removal of his cousin, the other Malcolm. The two competitors met at last, in A.D. 1003, at Monivaird, when a battle took place, in which Kenneth the Grim lost both the day and his life along with it.

The vigorous line of Kenneth III. was now again seated on the throne in the person of Malcolm II. The earlier part of Malcolm's reign appears to have been consumed in a long succession of fierce contests with the Danes, in the course of which these persevering invaders are said to have been defeated in the several battles of Mortlach in Moray, in the parish church of which place the skulls of the slaughtered foreigners were, not many years ago, to be seen built into the wall,—of Aberlemno, where barrows and sculptured stones are held still to preserve the memory and to point out the scene of the conflict,—of Panbride, where the Danish commander Camus was slain,—and of Cruden, near Forres, where a remarkable obelisk, covered with engraven figures, is supposed, but probably erroneously, to have been erected in commemoration of the Scottish victory. It was in 1020, also, in the reign of this king, that a formal cession was obtained from Eadulf, the Danish Earl of Northumberland, of the portion of modern Scotland south of the Forth, then called Lodonia, the possession of which had for a long period been disputed between the Scots and the Saxons, although in the mean time such numbers of the latter had settled in it that its population appears already to have become in the greater part Saxon, and the country itself was often called Saxonia or Saxony. Malcolm II., the ability of whose administration was long held in respectful remembrance, died in 1033.

The sculptured stone, commonly called Sueno's Pillar, at Forres. This stone, which is twenty-five feet in length by about four feet in breadth at the base, is the most remarkable of the ancient sculptured stones found along the east coast of Scotland. The side here represented is the east side, on which the sculptures are the most numerous. No satisfactory explanation has been given of the figures; but in this instance the popular name by which the stone is known, would seem to point out its connexion with the Danish invasions. Yet what can we make of the elephant by which the whole delineation is surmounted?

This king, unfortunately for the peaceful success of his father's scheme of changing the old rule of succession, left no son; but, imitating his father's remorseless policy, he had done his utmost to make a similarity even in that respect between himself and the rival branch of the royal stock by having, a short time before his decease, had the only existing male descendant of Kenneth the Grim, a son of his son Boidhe, put in the most effectual manner out of the way. In these circumstances no opposition appears to have been made in the first instance to the accession of Duncan, the grandson of Malcolm II., by his daughter Bethoc or Beatrice, who was married to Crinan, Abbot of Dunkeld,—in those days a personage of great eminence in the state. Boidhe, however, besides the son who was murdered, had left a daughter, Gruoch; and this lady had other wrongs to avenge besides those of the line from which she was sprung. Her first husband, Gilcomcain, marmor or chief of Moray, having been defeated in an attempt to support the cause of his wife's family by arms against King Malcolm, had been burnt in his castle along with fifty of his friends, when she herself had to fly for her life, with her infant son Lulach. She sought shelter in the remoter district of Ross, of which the famous Macbeth appears to have then been the hereditary lord, maintaining probably within his bounds an all but nominal independence of the royal authority, if he and his people indeed even professed to acknowledge the sovereignty of the Scottish king. This part of Scotland, it may be remembered, had been torn scarcely a century before from Constantine II. by the Danes, and Macbeth himself may possibly have been of Danish lineage. Be this as it may, to him the Lady Gruoch now gave her hand. She is the Lady Macbeth, made familiar to us all by the wonderful drama of Shakspeare. It would appear that for some time after the accession of Duncan, Macbeth and his wife had feigned an acquiescence in his title, and had probably even won the confidence of the good and unsuspecting king (the pure-breathed Duncan, as he is designated in Celtic song) by their services or professions. The end of their plot, however, was, that Duncan was barbarously assassinated in 1039, not as Shakspeare has it, in Macbeth's castle at Inverness, but at a place called

Bothgouanan, near Elgin.* Macbeth immediately mounted the throne, and the accounts of the oldest chroniclers give reason to believe that he filled it both ably and to the general satisfaction of the people. A usurper may be considered to give proof of ability by his successful attempt; and the original defect of his title will often force him to seek support by the wisdom and beneficence of his government. The partizans of the race of Kenneth III., however, resisted the new king from the first; for Duncan had left two sons, the elder of whom, Malcolm, fled on his father's assassination to Cumberland, and the younger, Donald, to the Western Isles. One revolt in favour of Malcolm's restoration was headed by his grandfather, the Abbot of Dunkeld; but this and several other similar attempts failed. At length, in 1054, Macduff, marmor or chief (improperly called by later writers Thane) of Fife, his patriotism inflamed, it is said, by some personal injuries, called to arms his numerous retainers; and Siward, the Danish Earl of Northumberland, whose sister Duncan had married, having joined him at the head of a formidable force, the two advanced together upon Macbeth. Their first encounter appears to have taken place, as tradition and Shakspeare agree in representing, in the neighbourhood of Dunsinan Hill in Angus, on the summit of which Macbeth probably had a stronghold.† Defeated here, the usurper retreated to the fastnesses of the north, where he appears to have protracted the war for about two years longer. His last place of refuge is supposed to have been a fortress in a solitary valley in the parish of Lunfanan, in Aberdeenshire. In this neighbourhood he was attacked by the forces under the command of Macduff and Malcolm, on the 5th of December, 1056, and fell in the fight, struck down, it is said, by the hand of Macduff. His followers, however, did not even yet everywhere throw down their arms. They immediately set up as King Lulach, the son of Lady Macbeth, who indeed, as descended from Duff the elder son of Malcolm I. in the same degree in which his rival was descended from Malcolm's younger son, Kenneth III., might be affirmed to have had the better right to the throne of the two. Lulach, however, a fugitive all the while that he was a king, did not long bear the empty title that thus mocked his fortunes. His forces and those of Malcolm met on the 3rd of April, 1057, at Eassie, in Angus; and that day ended his life, and also broke for ever the power of his faction. In a few days after this (on the 25th of April, the Festival of St. Mark) Malcolm III. was crowned at Scone. But the history of his reign belongs to the next period.

* "The word Bothgouanan means in Gaelic, the Smith's Dwelling. It is probable that the assassins lay in ambush, and murdered him at a smith's house in the neighbourhood of Elgin."—Hailes's Annals, i. 1. (Edit. of 1819.)

† The foundations of an ancient stone building are still to be found buried in the soil on the top of the hill. Dunsinan is about eight miles north-east from Perth; the hill is of very regular shape, and although more than a thousand feet above the level of the sea, it has been supposed to be in great part artificial.—See Chalmers's Caledonia, vol. i.

It will be convenient, also, before we close the present chapter, to turn for a few moments to the course of events in Ireland, which, although not politically connected with England in the period under review, had already acquired a remarkable celebrity, and begun to maintain a considerable intercourse both with Britain and with continental Europe. Taking up the history of Ireland at the point where we left it in the Introduction, we find the country at the commencement of our era subjected to the rule of the Scots, a foreign people, who had wrested the supreme dominion of it from the Tuath de Danans, in the same manner as the latter had displaced their predecessors the Firbolgs, with which last-mentioned occupants the first glimmerings of historic light break through the confusion and darkness of the national traditions. The fables of the bards, indeed, make mention of three still earlier races by whom the island was successively colonised,—the Partholans, so called from their leader Partholan, a descendant of Japhet, who arrived four hundred years after the flood;—the Nemedians, who came from the Euxine three centuries afterwards;—and the Fomorians, from Africa, who were the immediate predecessors of the Firbolgs. But all that can be gathered from the chaos of wild inventions which forms this first part of the Irish story is, that probably before the arrival of the Firbolgs the country had been peopled by that Celtic race to which the great body of its population still continues to belong. These primitive Celtic colonists, whose blood, whose speech, whose manners and customs remain, in spite of all subsequent foreign infusions, dominant throughout the island to this day, would seem to be the Partholans of the legendary account. The Fomorians, again, who came from Africa, were perhaps the Phenicians or Carthaginians. The Nemedians, the Tuath de Danans, the Firbolgs, and the Scots or Milesians, are affirmed to have all been of the same race, which was different from that of the Partholans; a statement which is most easily explained by supposing that all these subsequent bodies of colonists or invaders were of the Gothic or Teutonic stock, and came, as indeed the bardic narrative makes them to have done, from the north of continental Europe. It seems, at all events, to be most probable that the Scots were a Gothic people; Scythæ, Scoti, Gothi, Getæ, indeed, appear to be only different forms of the same word.* The Scots are supposed, by the ablest inquirers, not to have made their appearance in Ireland very long before the commencement of our era, if their colonization be not, indeed, a still more recent event; for we believe no trace of their occupation is to be discovered before the second or third century. From the fourth century down to the eleventh,—that is, during the whole of the period with which we are at present engaged,—Ireland was known by the name of Scotia or Scotland, and the Irish generally by that of the Scoti

* See this matter very ably treated in Pinkerton's Dissertation on the Origin and Progress of the Scythians or Goths, Part i. chap. 1.

or Scots; nor till the close of the tenth century were these names ever otherwise applied.* If the Scots of North Britain were spoken of, they were so designated as being considered to be a colony of Irish.

The bardic account, however, carries back the arrival of the Scotic colony, under the conduct of Heber and Heremon, the sons of Milesius, to a much more ancient date; and the modern inquirers who have endeavoured to settle the chronology of that version of the story have assigned the event, in the most moderate of their calculations, to the fifth or sixth century before the birth of Christ. Others place it nearly a thousand years earlier. It is related that the two brothers at first divided the island between them, Heber, the elder, taking to himself Leinster and Munster, and Heremon getting Ulster and Connaught; but, in imitation of Romulus and Remus (if we ought not rather to suppose the Irish to have been the prototype of the classic incident), they afterwards quarrelled, and, Heber having been slain, Heremon became sole sovereign. From him is deduced a regular succession of monarchs of all Ireland down to Kimbaoth, who is reckoned the fifty-seventh in the list, and is said to have reigned about two hundred years before our era. Besides the supreme monarch, it is admitted that there were always four subordinate kings, reigning each over his province; and the history is made up in great part of the wars of these reguli, not only with one another, but frequently also with their common sovereign lord. Tacitus relates that one of the reguli of Ireland, who had been driven from his country by some domestic revolution, came over to Britain to Agricola, who kept him with him under the semblance of friendship, in the hope of some time or other having an opportunity of making use of him. It was the opinion of Agricola that Ireland might have been conquered and kept in subjection by a single legion and a few auxiliaries. Tacitus observes, however, that its ports and harbours were better known than those of Britain, through the merchants that resorted to them and the extent of their foreign commerce.†

We need not further pursue the obscure and undoubtedly in great part fabulous annals of the country before the introduction of Christianity. It is probable that some knowledge of the Christian religion had penetrated to Ireland before the mission of St. Patrick; but it was by the labours of that celebrated personage that the general conversion of the people was effected in the early part of the fifth century. The first Christian king of Ireland was Leogaire, or Laogaire Mac Neil, whose reign is stated to have extended from A.D. 428 to A.D. 463. The twenty-ninth king, counting from him, was Donald III., who reigned from A.D. 743 to A.D. 763. It was in his time (in A.D. 748) that the Danes or Northmen made their first descent upon Ireland. In 815, in the reign of Aodhus V., these invaders obtained a fixed settlement in Armagh; and thirty years afterwards, their leader, Turgesius, or Turges, a Norwegian, was proclaimed king of all Ireland. At length a general massacre of the foreigners led to the restoration of the line of the native princes. But new bands speedily arrived from the north to avenge their countrymen; and in a few years all the chief ports and towns throughout the south and along the east coast were again in their hands. The struggle between the two races for the dominion of the country continued with little intermission and with various fortune for more than a century and a half, although the Danes, too, had embraced Christianity about the year 948. The closing period of the long contest is illustrated by the heroic deeds of the renowned Brien Boroimhe, or Boru, the "Brien the Brave" of song, who was first king of Munster, and afterwards king of all Ireland. He occupied the national throne from 1003 to 1014, in which latter year he fell, sword in hand, at the age of eighty-eight, in the great battle of Clontarf, in which, however, the Danish power received a discomfiture from which it never recovered. Brien, however, though his merits and talents had raised him to the supreme power, not being of the ancient royal house, is looked upon as little better than a usurper by the Irish historians; and the true king of this date is reckoned to have been Maelsechlan Mac Domhnaill, more manageably written Melachlan, or Malachi, whom Brien deposed. Malachi, too, was a great warrior;—the same patriotic poet who in our own day, and in our Saxon tongue, has celebrated "the glories of Brien the Brave," has also sung,—

> "Let Erin remember the days of old,
> Ere her faithless sons betray'd her,
> When Malachi wore the collar of gold
> Which he won from her proud invader;"—

and on the death of Brien, Malachi was restored to the throne, which he occupied till 1022. He is reckoned the forty-second Christian king of Ireland.* The interruption of the regular succession, however, by the elevation of Brien, now brought upon the country the new calamity of a contest among several competitors for the throne; and the death of Malachi was followed by a season of great confusion and national misery. The game was eventually reduced to a trial of strength between Donchad, the son of Brien, and Donchad's nephew, Turlogh; and in 1064 Turlogh succeeded in overpowering his uncle; who, bidding farewell to arms and to ambition, retired across the sea, and ended his days as a monk at Rome. Turlogh, reckoned a usurper by the native annalists, but acknowledged to have ruled the country ably and well, occupied the Irish throne at the epoch of the Norman conquest of England.

* See this completely established, and all the authorities collected, in Pinkerton's Inquiry, Part v. chap. 4.

† Agric. 24.

* In these dates we have followed the authority of the "Catalogus Chronologicus Regum Christianorum Hiberniæ," in O'Connor's "Rerum Hibernicarum Scriptores Veteres," vol. i. pp. lxxv., &c.

CHAPTER II.

THE HISTORY OF RELIGION.

Section I.—Saxon Paganism.

F the heathenism of the Angles, Jutes, and Saxons, the three tribes of northern Germany that supplied the invaders and conquerors of Britain in the fifth and sixth centuries, if these races had any system of superstition peculiar to themselves, we can hardly be said to know anything. But there is reason to believe that their mythology was the same which is known to have flourished at the same period, or not long after, among their kindred who remained in their original seats around the Baltic. The historic traditions of the Saxons as well as of the ancient Danes and Swedes, all ascend to and terminate with Woden, or Odin, the celebrated head of that mythology. This system is preserved to us in the two books of the Edda, the first compiled about A.D. 1057 by Soemund Sig-fusson; the second about A.D. 1180 by Snorro Sturleson, from such sacred poems of the ancient scalds, or bards of northern paganism, as still survived either in the memory of the people, or in a written form. A more compendious view of the religion of Odin is also given in the singular poem entitled the Voluspa, that is, the Prophecy of Vola, which is certainly more ancient than the second Edda, in which it is often quoted as an authority, and is believed, as well as the first Edda, to be the composition of Soemond. In describing the religion of the north, therefore, we are not, as in the case of the Druids, left to the vague inferences that may be drawn from a few notices, probably in many respects mistaken, left to us by writers of another creed, of doctrines which their votaries anxiously endeavoured to conceal from the uninitiated; but we have the fullest information on all the particulars of the system from the most competent authorities, its believers and professors themselves.

When we attempt, however, to investigate its earliest history, we are encountered by the same difficulties that are found to exist in the case of every similar creed. The source from whence it issued, the period of its first promulgation, and the agents by whom it was planted in the several countries where it flourished, are historical difficulties that still remain to be settled. Instead of facts, we are here presented with fables which it is impossible to restore to their original truth; and for the earthly founder of a religion, we have a shadowy form armed with the attributes of divinity, and receiving divine honours, after a life of miracles on earth. The most probable account that can be given of the matter appears to be the following:—Sigge, the son of Fridulph, chief of the Asi, a Scythian tribe, originally perhaps from the north of Persia, being oppressed, in common with the other chieftains of the country to the north of the Euxine, by Pompey, at the close of the Mithridatic war, in the century immediately preceding our era, resolved to maintain his liberty by abandoning the land of his fathers. Gathering, therefore, his people together, he led them in safety from the Euxine to the shores of the Baltic. There he found a country far wilder than that he had abandoned, and a scanty population, inferior in arts and arms to his warlike Scythians. The result of superior knowledge was soon exhibited. The houseless fugitive became a conqueror—the martyr to liberty an enslaver of nations. In a short period the subjugation of the surrounding regions attested the power of his arms, while, by his superior intelligence, he endeavoured to civilise those tribes which his valour had subdued.*

It was natural, under these circumstances, that the son of Fridulph should become a god. A rude and credulous people would easily be persuaded to deify a mortal who had come thus strangely among them, and wrought so wonderful a revolution in their social condition. The resistless conqueror was also a poet, a sage, a legislator, and a priest; and while his powers of persuasion are described as miraculous, he is supposed also to have distinctly claimed a divine commission. Political expediency might suggest to him such a step, to bind more firmly the tribes he had conquered by a common religion. In this manner Sigge, the conqueror and lawgiver of the north, is supposed to have become Odin, its presiding deity. Whether this was the name of the supreme Being whom the northern tribes had worshipped before his arrival, and which he was afterwards pleased to assume, is uncertain.† His children, who were numerous, were invested by him with the government of the conquered provinces; and

* Mallet's Northern Antiquities, chap. iv. † Ibid. ch. vi.

it was natural that they should subsequently find a place in the same mythology which had originated in the deification of their sire. This was but a new form of the Cretan Jupiter and his offspring. The end of the ambitious Scythian was well fitted to complete and consolidate his fabric of delusion. Finding his death approaching, he inflicted nine wounds in a circle upon his body, and telling his people that he was departing to his native land to become a god, he expired.*

In considering the career of this remarkable personage, the imagination naturally turns to the mysterious history of the first Peruvian Inca. But a still closer parallel is to be found between the Scythian Odin and the Arabian Mohammed. Both were impostors upon a gigantic scale, and influenced the destinies of a large portion of the human race. Under their auspices, the tribes of the East and the North were brought together, and inspired for the momentous part they were in due season called upon to act in the drama of the world, when they came in their irresistible might to destroy, that they might regenerate. The philosophy of history scarcely presents a more interesting subject of conjecture than the probable fate of the civilised world, had the two great superstitions sent forth their myriads simultaneously. What would have been the issue to the human race, had they met upon the great battle-field of the Roman empire, to contend with equal valour and fanaticism, while the possession of the earth itself was the prize in question?

It is proper to mention, however, that the chronology of Odin's emigration has been a subject of much controversy. While Mallet has placed the event as early as the time of Pompey,† others have postponed it till the beginning of the fourth century. It is probable that more than one victorious conqueror or subtle priest assumed the name of Odin, and that in process of time their several qualities and exploits came all to be attributed to the first, just as the achievements of several Greek champions, all assuming the name of Hercules, were bestowed upon a single hero. This supposition will also explain the circumstance of several northern warriors having asserted their descent from Odin at the distance of only four or five generations, at a date so recent as the Saxon invasion of England.‡

The religious system which the Scythian legislator established was, no doubt, amplified in a more advanced age by the united efforts of priests and poets, although in every stage it continued to correspond with the character of its ferocious votaries. Its breath is that of a furnace, and its "voice is still for war." A wild grandeur as well as a solemn gloom pervades it, harmonising with the scenery of its native home; and its fantastic array of tales and miracles was well adapted to the understandings of a people too ignorant to philosophise, and too indolent to cavil. Occasionally, too, there irradiate from its darkness those emanations of truth which are found in mythologies even the most depraved, and which appear to evince by their purity that they are light from heaven. These are most probably the relics of the simple theism of the patriarchal era. Even the Edda, here probably following the original belief of the rude children of the North, before the arrival of the Scythian, describes the supreme Divinity as "The author of everything that exists; the eternal, the ancient, the living and awful Being; the searcher into concealed things; the Being who never changes—who lives and governs during the ages; who directs everything that is high and everything that is low." But far different are the attributes of Odin. He is called "The terrible and severe god; the father of slaughter; the god that carries desolation and fire; the active and roaring deity; he who gives victory and revives courage in the conflict; who names those that are to be slain." Such a divinity was more suited to the imaginations of a people who continually rushed like eagles to the slaughter. The former could rule alone; and, therefore, by his simple votaries he was contemplated without the intervention of a delegate, and worshipped without an image. But the Odin of the subsequent mythology required the aid of associates, and therefore his followers liberally furnished him with deputies, for the various operations of heaven and earth. Frigga, or Frea, his wife, was the goddess of love, pleasure, and sensuality. Thor controlled the tempests, Balder was the god of light, Kiord of the waters, Tyr of champions, Brage of orators and poets, and Heimdal was the janitor of heaven, and the guardian of the rainbow. Eleven gods in all, and as many goddesses, all the children of Odin and Frea, assisted their parents, and were, like them, objects of worship.

These, however, would still have formed but a scanty polytheism; and when fancy assumes the right of creating gods, the limits are only determined by its own activity. An immense array of inferior divinities followed. There were three Fates by whom the career of men was predestined; and every individual was supposed, besides, to have a Fate attending him, by whom his life was controlled and its end determined. There were also the Valkeries, a species of inferior goddesses, who acted as celestial attendants, and who were also employed by Odin to determine victory and select the warriors who were to perish. And in addition to all these there was the usual corruption of the idea of an all-pervading Providence in the Genii and Spirits, who mingled in every event, and were possessed of supernatural power whether to bless or injure. The necessary concomitant of infernal agents was also appended to the creed. Their personification of the evil principle was

* Mallet's Northern Antiquities, ch. iv.

† This opinion is favoured by Snorro Sturleson, the Icelandic historian who flourished in the thirteenth century, and by the modern Torfæus.

‡ Another theory, however, is, that Odin never existed, and is merely a mythological personage,—the god of war. See this view supported by Pinkerton in his "Dissertation on the Scythians," Part ii. chap. 5.

Lok, sometimes deprecated as a god, and always dreaded as an enemy, whom the deities, in consequence of his malignity, had been constrained to shut up in a cavern. He is described in the Edda as beautiful in form, but depraved in character; "the calumniator of the gods, the grand contriver of deceit and frauds, the reproach of gods and men." The goddess Hela, the wolf Fenris, the great Dragon, the Giants, and the malignant Genii, completed the dark array of their mythology.

On the subject of a future state, the religion of the North was particularly explicit; and a heaven was formed congenial to a people whose chief employment and greatest pleasure was battle. Those who had led a life of heroism or perished bravely in fight, ascended to Valhalla, and the felicity which awaited them there was rapture to the imagination of a Dane or a Saxon. The day was spent in furious conflict, amidst the struggle of armies and the cleaving of shields; but at evening the conflict ceased; every wound was suddenly healed; and the contending warriors sat down to the banquet, where they feasted on the exhaustless flesh of the boar Scrimner, and drank huge draughts of mead from the skulls of their enemies. But the wicked, by which term the cowardly and the slothful were chiefly intimated, were doomed to the miseries of Niflheim.* There Hela dwelt, and exercised her terrible supremacy. Her palace was Anguish, her table Famine, her waiters Expectation and Delay, the threshold of her door was Precipice, her bed was Leanness, and her look struck terror into every beholder.

It is here that a creed generally terminates; but at this point the northern mythology only finds a resting-place for a moment. A fresh flight is commenced, and a new revelation more mysterious and more august than the former is unfolded. That bliss and those punishments are not eternal, but only for a season. After ages have revolved, and when time has arrived at its close, terrible signs in heaven and earth are to announce the coming dissolution; while the human race, unsuspicious of the danger, shall be involved in universal depravity. And then comes the end. The malignant powers, so long constrained, are to burst from their enthralment; the gods are to perish beneath their fierce assault, or in despair, and by mutual wounds; even Odin himself expires, while a conflagration bursts forth, in which Valhalla, and the world, and the place of penal anguish, with all their divine and human inhabitants, are to be consumed and pass away. But from this second chaos a new world is to emerge in its youthful grandeur, with a heaven more glorious than Valhalla, and a hell more fearful than Niflheim; while over all a God appears pre-eminent and alone, possessed of greater might and nobler attributes than Odin. Then, too, the human race are finally to be tried, when higher virtues than bravery, and heavier guilt than cowardice, are to form the standard of good and evil. The righteous shall then be received into Gimle, while the bad shall be doomed to the unutterable punishments of Nastrande; and either state shall continue through eternity, under the reign of Him who is eternal.

In this strange system it is interesting to mark the existence of two distinct creeds, united, yet not incorporated; the one simple and spiritual, the other extravagant and sensual. In other creeds a complete amalgamation has been accomplished between the first principles of pure religion and the adventitious corruptions of succeeding periods, because, in these, the progress from primeval truth to error has been the gradual work of ages. In that case, though a few of those original principles are suffered to remain, which form the common basis of every system of religious belief, yet the fables that gather upon them become gradually so identified with the whole, that they can scarcely be recognised or separated from the general mass. But in the system of Odin there is nothing of this complete intermixture and amalgamation. Here there is only one system superinduced upon another, while each remains separate and distinct. The coming of the ferocious and popular creed from Scythia resembled the sudden rush of a lava torrent rather than the gradual concretion of a fresh soil; and under its hard and gloomy surface we can discover the layer of earth still unmixed that, before the inundation, was the source of beauty and sustenance. The son of Fridulph, though he found in his new home a people far inferior to his own, yet found them possessed of a higher system of religion than was known to his more accomplished countrymen; and some of its principles he adopted, while the rest he tacitly sanctioned, or left undisturbed, in the propagation of his new creed. It is thus, perhaps, that we are to account for the discourse ascribed to him called the "Havamaal,"* containing a morality not only superior to his general precepts, but even at variance with their tenor; and thus also in the Edda have the singularly clear traditions of chaos, the creation of man, the deluge, and the restoration of the world, come to be mingled with the wildest fables. Thus, above all, may we solve the otherwise incomprehensible anomaly of the Northern creed, where we recognise so distinctly the existence of two chief deities, the one a warrior-god surrounded by his assistant powers, and doomed to perish,—the other a more spiritual and exalted Being, who reigns alone, and shall live for ever; together with the two-fold standard of good and evil, the double heaven, and the double hell. When truth and error thus come into competition the result may easily be anticipated. The former, severe and uncompromising in its authority, is supplanted by the indulgences of the latter; and the primitive simplicity of its ritual is soon eclipsed by gay festivals and splendid processions. It is for this reason that, among the fierce worshippers of Odin, we can discover no practical results of that patriar-

* Even the god Baldor, because he died a natural death, was consigned to the dominion of Hela. Edda, Fab. 29.

* Mallet's Northern Antiquities, vol. ii.

chal faith that lay immediately beneath the surface of their own system. Their tempest-breathing god, and his paradise of battles, though these were finally to be consumed, were more attractive than the excellencies of a more spiritual deity, and the eternity of a purer heaven.

The rites of the popular worship accorded with the spirit of such a grim theology. In Germany, in Denmark, in Sweden, and Norway, there were temples of colossal size but rugged workmanship, in which Odin was represented by a gigantic image armed, and crowned, and brandishing a naked sword; his wife Frea as an hermaphrodite; Thor wearing a crown of stars, and wielding his terrible mace; and the other gods and goddesses delineated according to their respective attributes. Songs composed under that wild inspiration which characterised the muse of the north were chanted in their praise; and, as in other rituals, animals deemed most acceptable to each god were sacrificed, while the blood was sprinkled upon the worshippers. But sterner offerings than these were sometimes deemed necessary, when the emergency was urgent, or when an extraordinary boon was asked of heaven. Human victims drenched the altar;* and while crowds of captives and slaves were frequently immolated, for the welfare of the people at large, princes often sacrificed their own children, either to avert a mortal sickness or secure an important victory.† As they believed that the exclusion from Valhalla, which a natural death entailed, could be avoided by the sacrifice of a substitute, every warrior who could procure a slave to put to death with this object, had a motive peculiarly powerful for so horrid a practice. This fearful practice of human sacrifice, which seems to have been common to every ancient creed of superstition, was merely the climax of the principle that ascended from a handful of fruits and flowers, to offerings the most costly and valued. When a sacrifice was regarded as a price, it was supposed that the magnitude of the gift should correspond with the importance of the petition, and in this view human life was tendered as the highest offering of all.

As females among the northern nations were regarded with a veneration elsewhere unknown, and were supposed to be chosen receptacles of divine inspiration, they were therefore considered as well fitted to preside over the worship of the gods. The daughters of princes officiated as priestesses of the national faith, were consulted as the oracles of heaven, and were frequently dreaded as the ministers of its vengeance; while those who cultivated the favour of the malignant divinities were held to be witches of mightier power and wilder terrors than the classical enchantresses of Thessaly. On the subject of the authority of the priests among the German nations we are less distinctly informed. Those of the Saxons were not permitted to mount a horse, or handle a warlike weapon;* and this prohibition has been supposed to have been a mark of disrespect among a people so devoted to arms; but probably it originated rather in their ideas of the superior sanctity of the sacerdotal office than in any intention to degrade it. This view seems to be confirmed by the account of Tacitus, who represents the German priests as also invested with magisterial authority. He informs us that they settled controversies, attended the armies in their expeditions, and not only awarded punishments, but inflicted them with their own hands, while the fierce warriors who received their stripes endured them as inflictions from the hand of heaven.

The gloomy regions of the north, and the lives of its inhabitants, alternating between the extremes of activity and repose, had a strong tendency to nurse a superstitious temperament. Among vast forests of perpetual twilight, among mountains rugged with rocks of ice and crested with storms, and the dismal vicissitudes of northern winters, the flitting shadows that traverse the wild scenery become spiritual visitants, while the mysterious sounds of hill and valley are regarded as their supernatural voices. The northern nations were superstitious, not only from the scenery in the midst of which they lived, but from their religion, which gave to every object and event a presiding spirit; and it was believed that from these supernatural intelligences might be extorted, not only counsel for the present, but premonition of the future. The direction of the wind, the aspect of the sky, the flight or voice of birds, the entrails of a victim, were all heavenly indications, in which the inquirers took counsel of the gods as to the course of an enterprise, and endeavoured to read its issue. The graves were invoked with vehemence, and the dead entreated to answer. The warrior, frequently scorning gentler methods, and resolving to force a reply, rushed, with his sword brandished, into the storm, that he might subdue its guardian spirit, and compel its reluctant utterance. When the knowledge desired was of high importance, the mode of consultation was proportionally solemn. Men were stabbed or thrown into the water; and from the manner in which the blood flowed, or the body sank, a satisfactory reply was elicited.† They also placed great reliance upon incantations; and they had songs by which the elements were controlled, and every evil averted, as well as every benefit obtained. The smith, an important personage everywhere in the earliest age of civilization, had a song by which the glowing iron beneath his hammer became a breastplate impenetrable to every earthly weapon, and another by which the sword received a charmed edge that nothing could resist. And when the bark, filled with its armed adventurers, was ready to rush forth wherever fortune might direct its course, a sure promise of favourable

winds and a rich harvest of plunder was supposed to be secured, from the chant of some withered beldame sent after it as it left the port. The same superstition that inspired the most transcendent daring could also depress its votaries into childish timidity. Those cheeks would turn pale at the untoward chattering of a bird, which no earthly danger could blanch; and an adverse fold in the entrails of a sacrifice stayed that projected expedition, of which the danger and the difficulty composed the highest charm.

Such were the general principles and observances of that religion which appears to have generally prevailed among the inhabitants of the North. We find, however, that they were subject to great modifications, according to the situation and circumstances of the several tribes. They were of a more sanguinary complexion, and clothed with wilder terrors, among the reckless followers of the sea-kings, than among those who dwelt on shore; and amidst the dark recesses of Norway, where the mind brooded over their horrors, unvisited and unrelieved, they were more extravagant than among the less isolated tribes of Germany. Perhaps the Saxon invaders of Britain might be classed with those among whom the religion assumed its least revolting shape, while the Danes, who afterwards followed in their track, exhibited the worship of Odin in its fiercest and most pernicious aspect. With them the primitive superstition was fearfully amplified by the principles and tales of the Scalds, who clothed it in their songs with horrors of which its first founders had probably no conception. Thus, though both Saxons and Danes worshipped the same gods, and believed in the same future state, yet the former, even while they continued heathens, became peaceful cultivators of the soil which their swords had won, while the latter did not subside into the same social condition until after they had abandoned their original creed.

Christianity.

When Hengist and Horsa, and their followers, arrived in Britain, in the middle of the fifth century, still pagans themselves, they found Christianity professed both by the inhabitants of the southern part of the island, the late Roman province, and also by a portion of the natives of the north, the modern Scotland, then known by the name of the Picts. The Christianity of the South Britons, however, there is reason to believe, had, in the distractions and miseries of the time, both ceased to exert much influence over the lives of its professors, and likewise become mixed with many corruptions of doctrine. Gildas has painted the manners of both

* This building, it need scarcely be observed, belongs to an age much more recent than that of Columba.

people and clergy in the darkest colours; and whatever allowance we may make for an apparently atrabilious temper, and a very vehement and declamatory style, his representations, which are in part adopted by Bede, have all the air of having a foundation of truth. In addition to general profligacy of conduct, he charges the British clergy with what he calls infidelity, by which he would seem to imply something beyond mere heresy or unsoundness of faith. From the oldest remains of the early Welsh poetry, which belong probably to an age not much later than that of Gildas, it would appear as if the ancient religion of Britain, which had no doubt lingered in the remoter corners of the country, had now shot up again into new life in the upsetting of the whole social system which took place at this crisis; for these poems are pervaded by a tone of sentiment and expression which betrays a strange intermixture of Christianity and Druidism —the latter, however, of the two combined elements, as was to be expected in such a case, being by far the more prevalent. On the part of the Bards, indeed, whose order enjoyed so important a station in the old pagan hierarchy, the design of restoring Druidism to its former ascendancy seems for a long period to have been systematically and perseveringly pursued. Throughout the protracted struggle with the Saxons it would appear to have been in the spirit and through the ritual of this Neo-Druidism, and not of Christianity, that the national feeling was chiefly appealed to, and the resistance to the foreigners sustained and directed.

In the northern division of the island, Ninian, according to Bede, had converted the Picts to the south of the Grampian range, about the year 412. Ninian is called Bishop of Whithern, in Wigtonshire, where he founded a monastery, and died A.D. 432. About the same time the heathenism of Ireland had been swept away, and Christianity established there as the national religion, by the exertions of the celebrated St. Patrick. The year 422 is assigned as the date of the arrival of that illustrious missionary in the country with which his name was destined to be so honourably connected for all succeeding ages. About the middle of the sixth century Kentigern, or St. Mungo, appeared among the Britons of Strathclyde, and is supposed to have founded the see of Glasgow. But the most distinguished of the missionaries to Caledonia, during this period, was Columba, venerated as the national saint of Scotland until that honour was conferred upon St. Andrew. He was born at Garten, a village now included in the county of Donegal in Ireland, and landed in Scotland, with twelve companions, in the year 563. Illustrious by his birth, being connected with the royal families of Ireland and of the Scots of North Britain, and possessed of those personal endowments that gain an ascendancy over a rude people, he addressed himself with great advantage to his self-imposed task of converting the heathen Picts to the north of the Grampians. Their king, Brude II., to whose court Columba proceeded, was the first who was baptized, and his subjects immediately followed the royal example. Columba then settled in Iona, where he founded his celebrated monastery, and established a system of religious discipline which became the model of many other monastic institutions. Much controversy has been waged upon the nature of the system of ecclesiastical polity founded by Columba; one class of writers, at the head of whom is the acute and learned Selden, maintaining it to have been strictly Presbyterian, while others contend that the Culdees, as the clergy generally were called, were subject to episcopal authority. The former is the opinion that has been most generally held, and that seems most conformable to the expressions of Bede, the earliest authority on the subject.* The small and barren island of Iona, after this, soon became illustrious in the labours and triumphs of the Christian church; and the Culdees, animated with the zeal of their founder, not only devoted their efforts to enlighten their own country, but became adventurous missionaries to fields the most dangerous and remote. It is gratifying also to observe that, with all the disputation there has been as to their form of church government, there is a general agreement as to the purity and simplicity both of their doctrines and of their lives. Even Bede, though indignant at their rejection of the authority of the Roman bishop, testifies that "they preached only such works of charity and piety as they could learn from the prophetical, evangelical, and apostolic writings." Of the care with which they were trained to be the guardians of learning and instructors of the people, we may form some idea from the fact that eighteen years of study were frequently required of them before they were ordained.*

In the south of Britain, in the first fury of the Saxon invasion, the storm had burst with equal violence upon tower and temple. Amidst the havoc of an exterminating warfare the churches were destroyed and the ecclesiastics massacred, so that at length the former Christianity of the country was chiefly to be traced by heaps of ashes and tokens of devastation. Yet there is no probability, as we have observed in another place, in the common notion that all the native Britons were swept from the soil which was thus overrun; and as the great body of the labouring population were in all likelihood allowed to remain as the bondmen of the conquerors, we may suppose that such of them as were Christians, and most, if not all of them must have been so, would be permitted to retain their faith in peace. Without a clergy, however, or any apparatus of which a trace can be discovered for the administration among them of the ordinances of religion, for we find no notice of even a single Christian church being anywhere kept up as a place of worship, it is not easy to conceive that they would very generally or very long retain their knowledge and profession of the truth. But meanwhile, as their position in the country

* Hist. Eccles. lib. iii. c. 4.

* Adomnani. Vit. Sti. Columbæ.

became easier and more secure, the Saxons, naturally turning their swords to ploughshares, were themselves gradually losing something of their old ferocity, and acquiring a disposition and habits more favourable for their own conversion to the religion of love and peace. When things were in this state an incident occurred which, simple in itself, led to great results. Gregory, afterwards Pope, and surnamed the Great, passing one day through the streets of Rome, was arrested at the market-place by the sight of some young slaves from Britain, who were publicly exposed for sale. Struck with the brightness of their complexions, their fair long hair, and the remarkable beauty of their forms, he eagerly inquired to what country they belonged; and being told that they were Angles, he said, with a sigh, "They would not be Angles, but Angels, if they were but Christians." Continuing his inquiries, he played in the same whimsical manner upon the name of the district from whence they had been brought, and that of the king who reigned over it. But never, perhaps, were puns expressed in a spirit of purer benevolence or attended with more important consequences. Anxious that a people so endowed by nature should no longer be left without a knowledge of divine truth, he resolved, at every hazard, to carry the gospel to their shores, and actually set off upon the dangerous pilgrimage. His friends and countrymen, by whom he was enthusiastically beloved, were dismayed at his departure, and prevailed upon the Pope to command his return. When, some years after, however, he succeeded to the Popedom, and found a fitting opportunity, he appointed Augustin, prior of the convent of St. Andrew's at Rome, with forty monks, to proceed on a mission to England. The holy men departed accordingly upon their journey, but when they had reached Aix, in Provence, they were so dismayed by accounts of the ferocity of the Anglo-Saxons, that they refused to proceed, and sent to Gregory to ask permission to return. The benevolent pontiff, in his reply, adjured them by every Christian motive to persevere in their enterprise; and, to facilitate its success, he wrote letters in their behalf to the kings and prelates of France. By these they were received with kindness, and supplied with interpreters, the language of the Franks and Saxons being nearly the same;* and in the year 597 they landed in the Isle of Thanet. Augustin immediately despatched one of his companions to the court of Ethelbert, the king of

Gregory and the Angles.—Singleton.

Kent, announcing the purpose of his coming, and entreating the countenance and protection of the king.

No selection of place could have been more happy for the commencement of the good work. Ethelbert held the important rank of Bretwalda, and his authority extended to the shores of the Humber.* His queen, Bertha, as we have already mentioned,† was a Christian princess; and having stipulated at her marriage for the liberty of professing her own religion, she had several French priests in her train, and a bishop of the name of Liudhard, by whom the rites of the Christian faith were performed in a ruined church that had been repaired for her use, without the walls of Canterbury.* The king was thus not only in some measure acquainted with the religion of the strangers, and perhaps inclined in its favour, but possessed of power to protect them in teaching it; while in the queen they could avail themselves of an assured and influential friend. On the other hand, the opposition of the Pagan priesthood was feeble and momentary. They advised the king to meet the strangers, not under a roof, but in the open air, as he would there be safe from their magical contrivances—an idea perhaps suggested by those miraculous powers which Christian missionaries, at this period, were but too ready to claim. This

AUGUSTIN PREACHING BEFORE ETHELBERT.—Tresham.

precaution Ethelbert adopted. Augustin and his companions advanced to the important interview in solemn procession; a silver crucifix, and a banner on which was painted a picture of the Redeemer, were borne before him, while the attendant monks made the air resound with their melodious anthems, which they sang in alternate choirs. After this impressive commencement, Augustine, through the medium of an interpreter, gave the king a summary delineation of the nature of the Christian faith; and after describing the triumphs it had achieved, and the blessings it had conferred upon the nations among whom it was established, he implored him to receive this beneficent religion, and allow it to be taught to his subjects. The reply of Ethelbert was cautious, but encouraging. He said that he had no intention to forsake the gods of his fathers for a new and uncertain worship; but since the purposes of the strangers were good, and their promises inviting, they should be suffered to instruct his people, while he would secure them from interruption, and maintain them at his own expense. On receiving this favourable answer, the monks joyfully directed their procession towards the neighbouring city of Canterbury; and as they entered within its walls, they chanted these words of solemn intercession: "We beseech thee, O Lord, of thy mercy, let thy wrath and anger be turned away from this city, and from thy holy place; for we have sinned. Hallelujah!"*

They now began to preach among the Saxons of Kent,—the purity of their lives and the simplicity of their manners forming powerful arguments in favour of their doctrines. The idolaters were compelled to venerate a faith so illustrated, and converts began to crown the labours of the missionaries. At last Ethelbert himself, persuaded by their reasoning, and probably induced by the entreaties of his queen, consented to be baptized. This important event happened on the day of Pentecost; and on the ensuing Christmas ten thousand of the people followed the royal example. The joy of Gregory, when he heard these tidings, was so great, that he conferred the primacy of the whole island upon the capital of Kent, and sent the pall to Augustin, who had already been consecrated archbishop of Canterbury by the prelate of Arles, to whom he had repaired for that purpose.† As emergencies arose in this sudden success which Augustin had not foreseen, he sent to the pope a series of questions for solution, some of which appear sufficiently strange in the present day.‡ He asks, among other things, if a pregnant woman may be baptized?—what interval of time should elapse, after her confinement, before she could be admitted into the church?—and also, lest an infant should die, after how many days it might be baptized? These queries, which were gravely propounded, were as gravely answered. But a more important difficulty presented itself respecting the abolition of heathen festivals and ceremonies, to whose allurements the simple converts were still fondly attached. It was feared that their entire abrogation would be too violent a change in the rude habits of the people, and might provoke a relapse into idolatry. By the advice of Gregory, Augustin, instead of destroying the heathen temples, consecrated them as Christian churches; and while the festivals were suffered to remain, they were held in honour of the saints—the same number of animals as before being still eaten, and sober, religious joy assuming the place of outrageous conviviality.

From the facility with which the Christian faith had thus been established in Kent, Augustin hoped for a similar conversion of the whole island. But though Gregory had sent him additional aids, his resources for this great work were still inadequate. In this emergency he resolved to endeavour to secure the assistance of the Welsh ecclesiastics. Unfortunately, however, these heads of the more ancient British church were indignant at the metropolitan authority which the Roman missionary assumed in virtue of his papal appointment, and the subserviency he demanded to the bishop of Rome, whose claim to universal supremacy in the church they could not comprehend. With this might be connected a lurking feeling of envy at the success of Augustin among the Saxons, and of shame at the rebuke it administered to their own supineness. There were other grounds of difference also between the native British and the Italian priests, the chief of which was regarding the proper period for the celebration of Easter.* This state of matters made co-operation between the parties hopeless. At the first meeting, which was attended by only a small number of the Welsh clergy, nothing was concluded. It was agreed, however, that another meeting should take place, at which the native priests promised to assemble in greater force. During the interval, they consulted a hermit, one of their countrymen, famed for his sanctity and wisdom, respecting the claims of Augustin, and received this sententious

* Bed. i. 25. † Ibid. i. 27-29. ‡ Ibid. i. 27.

* As this matter has been generally misunderstood and misstated, it may be well to quote the following correct explanation: "The difference between the Roman and Eastern church concerning Easter, which began about the year 200, lay in this. The churches of Asia observed this feast on the fourteenth moon, upon whatsoever day of the week it fell out, being the day on which the Jews offered their Paschal lamb. The church of Rome celebrated it on the Sunday following that day, if it chanced not to fall on Sunday; but did not, as the Eastern churches had, from perpetual practice and tradition, ever done, celebrate Easter on a week day. Thus the difference between the Roman and Eastern church only consisted in *six days* at most; and the only question was, whether Easter was to be celebrated on the week day on which it fell, or on the Sunday following. At the Council of Nice A.D. 325, Asia was forced to follow the European mode; and from that time till 532, all the world kept Easter alike. Very different was the dispute between the Roman church and those of Britain and Ireland, concerning Easter. It began in the sixth century upon this ground. In 532, Dionysius Exiguus, a Roman priest, introduced a great variation into the mode of computing Easter, of which the technical terms would neither instruct nor entertain the reader. Suffice it to say, that his rule, adopted by the Roman church, threw the celebration of Easter a whole *month* further back than before. But Britain and Ireland were as obstinate for their old Easter as they were lately for the old style; and thus kept Easter a whole month before the Roman church. Cuminius, who lived at the time, specially mentions this difference of a month (Ussor. Sylloge, p. 34); and the dispute between the Roman and the British and Irish churches was not known till Augustin the monk was sent to convert the Saxons, in 597."—*Pinkerton's Inquiry into the Early History of Scotland*, ii. 265. (Edit of 1814).

advice: "If the stranger be a man of God, follow him." "But how," said they, "shall we know that he is a man of God?" "By his humility," replied the anchorite. As this reply was still vague, he furnished them with the following criterion, by which the humility of Augustin might be tested. "When you repair," he said, "to the appointed conference, observe the manner in which he receives you. If he rise at your approach, be sure that he is the leader whom God has appointed you to follow; but if he receive you seated, reject him for his pride." Furnished with this index, the synod, consisting of seven bishops, and the abbot of Bangor, repaired to the conference; but Augustin did not rise at their approach. This instance, whether of arrogance or oversight, set the seal upon his rejection. He limited his demands to three particulars, which were, that they should agree with the Roman church in the time of keeping Easter; that they should use the same ceremonies in the sacrament of baptism; and unite their efforts with his in the conversion of the Saxons. But to these proposals they returned an abrupt and unqualified negative. The indignation of Augustin now burst forth. Assuming the tone of a prophet, he declared to them, that since they refused their aid in converting the Saxons, by the swords of the Saxons they should perish. It has been insinuated by Jeffrey of Monmouth, and the imputation has been re-echoed by successive historians, that the archbishop, by his intrigues, procured the fatal accomplishment of his prophecy, in the slaughter some time after of the monks of Bangor by the Northumbrian king Edilfrid. But that appears to have been a sudden and accidental, not a premeditated act of devastation, and it did not occur till some years after the death of Augustin.

Notwithstanding the failure of this negotiation with the Welsh church, the commencement of Christianity among the Saxons had been too prosperous for the progress of the faith to be now permanently checked. In the converted Bretwalda himself it found a zealous and efficient advocate. Sebert, king of Essex, his nephew, moved by the example and arguments of Ethelbert, abjured his idols, and received the rite of baptism: this event happened in the year 604. Numbers of the people having as usual immediately followed the example of their king, a Christian church was erected in London, Sebert's capital, upon the rising ground formerly the site of the Roman temple of Diana. This church was dedicated to St. Paul; and each successive building, upon the same site, has retained the name to the present day. A second royal convert rewarded the zeal of the Bretwalda, in the person of Redwald, the king of East Anglia. We have already related the compromise he made between his own convictions and the opposition of his queen and nobility, by setting up a Christian altar and an idol in the same temple, and leaving his people to judge for themselves between the rival religions.* This strange and perilous experiment is said to have been attended with full success. The contrast was so striking, that the ancient faith was gradually forsaken, and East Anglia was numbered among the Christian kingdoms of England.

In this same year (604) Augustin died, after having thus seen the gospel firmly established in the kingdoms of Kent and Essex. The early historians of the English church have adorned him with every apostolic virtue, and the honour of canonization has been awarded to him by the gratitude of the Roman pontiffs. At this distant period it is difficult to form a proper estimate of his character; but we may venture to affirm, that while he felt the paramount importance of Christianity, and laboured devotedly for its extension, he showed himself, in many instances, but little scrupulous as to the means by which he sought to accomplish so desirable an end. Such, indeed, was too generally the conduct of the saints and missionaries of that period. While they compassed sea and land with all the zeal of the apostolic ages, they never lost sight of Rome and its spiritual supremacy. Augustin consecrated Justus bishop of Rochester, and Mellitus bishop of the East Saxons, and appointed his faithful follower Laurentius to be his successor in the see of Canterbury.

Laurentius had to contend with still more serious difficulties than those which had impeded the efforts of Augustin; and the faith, so lately planted among the Anglo-Saxons, was soon doomed to sustain a violent shock. Sebert, the protector of the Christian church in the kingdom of Essex, died; and his three sons endeavoured to re-establish the ancient superstition. In consequence of the violent measures which followed, Mellitus was banished, and obliged to flee for shelter to his friend Justus. Here, however, he found the church in a condition equally perilous. It has been already related * how Eadbald, the son and successor of Ethelbert, had married the youthful widow of his father, and in consequence of the remonstrances of the ecclesiastics, had become hostile both to their persons and their religion. In this gloomy posture of affairs Laurentius, Mellitus, and Justus, hastily concluded that their cause was hopeless: the two latter retreated with precipitancy to Gaul, and Laurentius himself prepared to follow them. In such an emergency, which threatened the extinction of Christianity in England, it seemed as if nothing short of a miracle could have saved it; and, if we may believe the early writers, a miracle was vouchsafed. On the night previous to his intended departure, Laurentius passed the night in the church dedicated to St. Peter and St. Paul. At midnight the prince of the Apostles appeared to him; and after reproaching him for his lack of zeal in thus abandoning his spiritual charge, he bestowed a severe flagellation upon the trembling archbishop. On the next morning, when Laurentius repaired to the palace, he threw off his cloak, and displayed before the king his back and

* See ante, p. 145.

* See ante, p. 145.

shoulders, bloody and waled. Eadbald, dismayed at the spectacle, and apprehending a worse visitation for himself, made haste to repair the consequences of his apostacy. He cursed the idolatry into which he had relapsed, and dissolved the unnatural union in which it had originated. In consequence of his repentance, Mellitus and Justus were recalled, and the cause of Christianity was restored with fresh lustre. Such is the tale which Bede has delivered, and which he would have thought it impiety to question. We may venture, without any breach either of faith or charity, to regard the flagellation of Laurentius as one of those well-intended stratagems, or pious frauds, which abound in the proceedings of persons of that age, pursuing evidently the worthiest ends and actuated by the highest and purest motives.

The most important event in the history of the Saxon church, after the conversion of Ethelbert, is that of Edwin, by which Christianity was introduced into the powerful kingdom of Northumberland. Here, too, we are encountered by miracles, which indeed make up so much of the story as given by the original authorities, that it is impossible now to separate what is fact from what is fiction. We must repeat the legend, therefore, as Bede has recorded it. Edwin had passed the greater part of his youth as a fugitive and an exile, continually exposed to the machinations of his relentless enemy Edilfrid, who then occupied the Northumbrian throne. Driven from the protection of Cadwallon, the king of North Wales, he wandered from court to court, until at last he seemed to have found a permanent shelter with King Redwald in East Anglia. But his haunt was discovered by Edilfrid, who thereupon immediately sent to Redwald demanding that Edwin should be given up. As the power of Edilfrid was terrible throughout the Heptarchy, the heart of Redwald failed, and he resolved to secure his safety at the expense of hospitality, justice, and religion. A faithful friend advertised Edwin of the deliberation within the palace, and exhorted immediate flight, offering, withal, to conduct him to a place of safety; but the spirit of the noble exile, that had contended so long against misfortune, was weary of the struggle. He declared that he would fly no further; and that it was better to perish by the treachery of his host, and the cruelty of his enemy, than continue the life of disquietude which he had hitherto led. In this gloomy spirit of resignation he sat down near the gate of the palace, prepared for whatever might await him.

In the mean time, while his friend left him to gain further intelligence of the deliberation, and Edwin remained thoughtful and alone, revolving the bitterness of his fate, amidst the gloom of the approaching midnight, a stranger (continues the story) advanced, and demanded wherefore he sat there, and awake, at an hour when other men were asleep? Edwin, raising his head, abruptly asked, in turn, how it could concern his questioner whether he passed the night under shelter or in the open air? The stranger then told him that he knew well the nature of his present condition, and the causes of his disquietude. "Now tell me," he said, "what thou wouldst give to him, whoever he might be, who should deliver thee from these calamities, and so persuade Redwald that neither he nor his enemies should do thee hurt?" Edwin, encouraged by the prospect, replied that he would show all the gratitude in his power to him who should render him such a benefit. "And what wouldst thou give," again demanded the mysterious stranger, "if he should truly promise thee the destruction of thy enemies, and the possession of a kingdom, so that thou shouldst surpass not only all thy predecessors, but all the kings of England who have gone before thee?" To which Edwin replied, that to him who should render him such favours, he would answer by corresponding actions. A third time the strange visitant propounded a prophetic question: "If he who procured such blessings should truly foretell to thee what is to come, and give thee, for the security of thy life and fortunes, such counsels as none of thy fathers and kindred ever heard, wouldst thou follow them? and dost thou promise to receive his salutary directions?" Edwin joyfully declared that he who conferred upon him such distinguished benefits should from thenceforth be his guide. The stranger then placed his right hand upon the head of Edwin: "When this sign," he said, "shall come upon thee, remember this time, and our conversation, and the promises thou hast made." When he had uttered these words he suddenly disappeared; so that Edwin perceived he had been talking, not with a man, but a spirit.

His friend who had lately left him now returned from the palace with joyful intelligence. The timid Redwald had been awakened to shame, and roused to courage, by the remonstrances of his high-spirited consort, so that he determined rather to brave the vengeance of Edilfrid than incur the reproach of treachery, and had dismissed the ambassadors with a bold refusal of their demands. Aware of the position in which he had placed himself, he lost no time in mustering his army, and marching against Edilfrid. The victory which followed, and the death of Edilfrid, placed Edwin on the throne of Northumbria. The persecuted wanderer thus suddenly raised to an eminent station among the kings of the Heptarchy, evinced the excellence of the lessons of adversity by the prudence and prosperity of his government. After a reign of nine years he sought in marriage Ethelberga, the daughter of the late Ethelbert of Kent. But the princess was a Christian, and Eadbald, her brother, was averse to her union with an idolater. This difficulty was removed by the agreement of Edwin that she should be allowed the free profession of her religion; and he even promised to embrace the same faith himself, if, on examination, he should find it worthy of adoption. The queen was accompanied to Northumbria by Paulinus, one of the last of the missionaries whom

Gregory had sent to Augustin; and as, by rather a rare chance, the prudence of this ecclesiastic was equal to his zeal, he forbore to press the subject of Christianity prematurely upon the mind of Edwin, but left the matter to time and opportunity. On the other hand, the king still adhered to his idolatry, and seemed to have forgotten both the vision and his marriage agreement. At length a narrow escape which he made from the dagger of an assassin happening at the same time with the birth of a daughter, appeared to Paulinus to afford a fit occasion for remonstrance, and in such a susceptible moment the heart of the king was touched. He allowed the infant to be baptized; and he promised that, should he return victorious from an expedition on which he was about to set out against the king of Wessex, he would himself submit to the same ceremony. He was successful; but still he hesitated. A thoughtfulness and caution, unusual among the royal converts of the Heptarchy, retained him in painful suspense,* to the great regret of the Pope, his consort, and Paulinus. At length Paulinus one day entered the apartment while Edwin was absorbed in thought, and, laying his right hand upon the head of the king, he solemnly said, "Dost thou remember this sign, and the engagement it betokened?" In an instant the king fell down at the feet of Paulinus, who, immediately raising him up, reminded him that all which had been promised by the heavenly-stranger was now fulfilled. The result was Edwin's instant determination to fulfil also his own part of the engagement. Such is the story. How far it is a mere fiction, or how far the facts related were the result of contrivance or of chance, it is now impossible to determine. It comes down to us, as has been observed, on the authority of Bede, who was incapable of inventing it, but whose credulity was equal to any demands of that superstitious age. Bede was born within half a century of the date (A.D. 627) assigned to the conversion of Edwin.

Before he was actually baptized, however, Edwin called an assembly of his nobles, that they might discuss the claims of the new faith and the old; and, having announced his sentiments, he desired each member to deliver his opinion upon the subject. Coifi, the high-priest, was the first to speak, and, to the surprise of the whole assembly, he declared that the gods whom they had hitherto worshipped were utterly useless. None, he proceeded, had served them with greater zeal than himself, and yet others had prospered in the world far more than he had done; he was, therefore, quite ready at least to give a trial to the new religion. One of the nobles followed in a wiser and purer spirit. Comparing the present life of man, whose beginning and end is in darkness, to a swallow entering a banqueting-hall to find refuge from the storm without, flitting for a moment through the warm and cheerful apartment, and then passing out again into the gloom, he proposed that if Christianity should be found to lighten this obscurity, and explain whence we came and whither we departed, it should immediately be adopted. Coifi, upon this, moved that Paulinus should be called in to explain to them the nature of Christianity, which was immediately done; and so cogent were the arguments of the missionary, that the impatient Coifi declared there was no longer room for hesitation. He proposed that the national idols should be immediately overturned; and, as he had hitherto been the chief of their worshippers, he offered to be now the first to desecrate them. He therefore threw aside his priestly garments, called for arms, which the Saxon priests were forbidden to wield, and for a horse, which they were not permitted to mount, and thus accoutred he galloped forth before the amazed multitudes, who thought he had become frantic. Advancing to a temple in the neighbourhood, where the chief idol stood, he hurled his lance within the sacred enclosure, by which act the building was profaned. No lightning descended, no earthquake shook the ground; and the crowd, encouraged by the impunity of the daring apostate, proceeded to second his efforts. The temple and its surrounding enclosures were levelled with the ground. This event happened at a village still called Godmundham, which means the home or hamlet of the enclosure of the god.*

The conversion of the king was followed by that of multitudes of his subjects; so that Paulinus, who was afterwards consecrated Archbishop of York, is said to have baptized twelve thousand converts in one day in the river Swale. During the short remainder of his reign Edwin continued to second the efforts of the archbishop in advancing the cause of religion among his subjects. Being offered the crown of East Anglia, on the death of his benefactor Redwald, he refused it in behalf of Eorpwald, the son of Redwald, whom he persuaded to embrace Christianity. He now, however, succeeded to the supreme dignity of Bretwalda, which he retained till he fell, while yet in the vigour of his days, in battle against the terrible Penda, in the year 634. In consequence of this calamitous event the cause of Christianity in Northumberland was arrested in the midst of its triumphs; and such was the general apostacy of the people, that Paulinus was obliged to abandon his see, and retire into Kent. This general apostacy, however, was counteracted on the accession of Oswald. Having spent his youth in Iona, to which northern sanctuary he had repaired for shelter, and having been taught Christianity among that primitive community of Culdees, he naturally sent thither for spiritual instructors to his people when he was established upon the throne. Corman, a monk, was accordingly sent from the monastery of Iona to Northumberland, but, disheartened by the difficulties of his office, he quickly returned. While he was descant-

* "Sed et ipse cum esset vir natura sagacissimus, sæpe diu solus residens, ore quidem tacito, sed in intimis cordis multa secum conloquens, quid sibi esset faciendum, quæ religio servanda, tractabat." Bed. ii. 9.

* Bed. ii. 12, 13.

ing to the assembled chapter of his order on the barbarous dispositions and gross intellect of the Northumbrians, and vindicating, on that score, his abandonment of his task, a voice of rebuke was heard from amidst the throng,—"Brother, you seem to have forgotten the apostolic injunction, that little children should be fed with milk, that they might afterwards be fitted for stronger food!"* Every eye was turned upon the speaker, who was Aidan, a monk of the order; and he was immediately appointed to the mission, and sent to the court of Oswald. The learning and piety of the ardent Culdee vindicated the choice of his brethren. He addressed himself with zeal and patience to reclaim the apostate Northumbrians; and in these labours he was well seconded by the king, who interpreted his sermons to the people. Aidan, in the year 635, fixed his seat, and founded a monastery upon the bleak island of Lindisfarne, directed perhaps in his choice by its resemblance to his beloved Iona; and there his religious community flourished for more than two centuries, until it fell beneath the fury of the Danes. Oswald,

* Bed. iii. 5.

who as well as Aidan has been honoured with the title of saint, was solicitous for the conversion not only of his own people, but of those of the other states of the Heptarchy; and, having repaired to the court of Wessex, to demand the daughter of King Cynegils in marriage, he prevailed upon both the king and the royal bride to embrace the Christian faith. Berinus, a missionary, sent from Rome to the court of Wessex, was thus enabled to preach successfully to the West Saxons, and an episcopal see was founded at Dorchester, of which he was consecrated bishop.*

The introduction of the gospel into the powerful kingdom of Mercia was the next event by which its progress was distinguished; and, as in several preceding cases, it was the consequence of a royal marriage. Peada, the son of the terrible Penda, in whom the Christianity of England had hitherto found its deadliest enemy, solicited, while his father was yet alive, the hand of Alchfleda, the daughter of Oswy, king of Northumberland; but the princess refused to be united to an unbelieving husband. The prince, in consequence, abjured

* Bed. iii. c. 6.

Consecration of a Saxon Church. From the Cottonian MS. of Caedmon's Metrical Paraphrase of parts of Scripture.

his idols, and became a Christian; and on his return to Mercia, he brought with him four missionaries, who were successful in converting many of his father's subjects. The aged monarch, though he refused to be himself baptized, tolerated the labours of the Christian priests; and he even required consistency of conduct in those of his court who professed the Christian faith.* The small kingdom of Sussex was now the only state of the Heptarchy the subjects of which still remained idolaters; but they, too, were converted about the close of this century, by the exertions of Wilfrid, bishop of York, who found shelter among the South Saxons when driven from his see, and is said to have obtained a great influence over them by instructing them, among other things, in the art of fishing. Thus, in less than ninety years from the arrival of Augustin, Christianity was established over the whole of England.

The conversion of a great country, inhabited by different tribes, and divided into several kingdoms, often at war with each other, was thus accomplished with a rapidity and facility resembling more the miraculous triumphs of the apostolic age, than the progress of Christianity in after times. It is evident, from the view already given of the northern mythology, that it was only fitted for predatory savages. Its element was carnage, its morality a code of strife, and its rewards plunder and revenge; and however, therefore, such a ferocious system might have suited the Saxons when they were wont to rush from the gloom of the forest into the storms of the ocean, it lost much of its influence when they sat down quietly in a conquered kingdom, to enjoy their spoils. Nay, the Saxons, thus situated, may have begun to regard even with a jealous eye a religion that might animate, in turn, a more adventurous people than themselves to land upon their shores, and bereave them of the fruits of their victories. All the local attachments also which endear a national faith to a people were completely broken, when the roving Saxons became stationary cultivators of the soil. The sanguinary sacrifices, the wild rites, and turbulent festivals of the system of Odin, could only flourish in their native north, and amidst its hurricanes and storms, and must have drooped, when transplanted into the "gay greenwood" and tranquil atmosphere of England. While the conquerors of Britain were thus loosely held by a religion unsuitable to their new condition, and whose chief attractions were left behind, the Christian faith was brought to their shores. Their peculiar wants, and the general circumstances of the time, were equally favourable to its acceptance. It was fitted for the settled occupants of a land, because it was a religion of love, and peace, and order; and it was the established faith of that civilized world around them in which it was now

* Bed. iii. 21.

A CHRISTIAN MISSIONARY PREACHING TO THE BRITISH PAGANS,—Mortimer.

necessary for them to become naturalized. Fully admitting, therefore, the piety and sincerity of the first royal converts of the Heptarchy, we may still be inclined to conjecture that they were in some degree also favourably disposed towards the new faith by their conviction of the advantages they would derive from its adoption, in forwarding the civilization of their kingdoms, and their adoption into the family of Europe.

Further, the importers of Christianity into England were not a handful of obscure adventurers. They came from Rome, still a mighty name, and regarded as the metropolis of all that was intellectual and venerable; and they came recommended by kings and prelates. Their arrival was, therefore, a great national embassy. Thus highly accredited, the Roman ecclesiastics were certain, not only of a safe reception, but also of a patient hearing. Their principal task which remained, therefore, and for which they were well qualified, was to show the superiority of knowledge over ignorance, and of a true religion over one that was false. It was then that their intrepidity, their lofty ambition, and persuasive powers, combined with purity of character and religious zeal, gave them their due superiority, and produced the natural results.

The missionaries wisely addressed themselves, in the first instance, to the kings of the Heptarchy; and these having readily embraced a religion so attractive as Christianity, and so advantageous for their political circumstances, their subjects were naturally eager to follow the example. Each royal convert was earnest to secure the conversion of his allies, and frequently accomplished, by a friendly visit, or a political convention, the religious change of a whole kingdom. It has often been observed, that wherever the Christian faith has entered, it has found its most zealous advocates among the female sex, to whom in particular it recommends itself, not only by its intrinsic excellence, but by the equality to which it raises them with the other sex. This was remarkably exemplified among the Anglo-Saxons. The women here, possessing an influence in society unknown to the most refined nations of antiquity, were enabled powerfully to promote the extension of the faith; and while the princesses refused to espouse idolatrous kings, unless they consented to be baptized, we can well imagine that, in numberless instances, among persons of inferior rank, the "unbelieving husband was converted by the believing wife." Nor was the influence of the Saxon females impaired by the adoption of Christianity. A prioress might preside over a meeting of ecclesiastics, and legislate for the government of the church; and might take precedence in rank of all the assembled presbyters, as was the case in the council of Becanceld, convoked in the year 694. *

A variety of powerful causes were thus combined in behalf of Christianity, and their effect was exhibited in its rapid and cordial adoption. It is also worthy of remark, that all was accomplished without violence on either side. No convert seems to have been compelled; no preacher was required to seal his testimony by martyrdom. The fervent proselytising zeal of missionaries and kings was met by the spontaneous assent of the people, and the conversion of the land was accomplished with a peacefulness to which it would be difficult to find a parallel.

When Christianity thus became the religion of Saxon Britain, its rude inhabitants were prepared for the further blessings of learning and civilization, and these were now introduced in the train of Theodore, Archbishop of Canterbury, who was consecrated to the primacy by Pope Vitalian in 668. Like St. Paul, he was a native of Tarsus in Cilicia, and eminent for his extensive learning. Though already sixty-six years old, yet such was the energy of his character, that a life of usefulness was still expected from him; and these hopes were not disappointed, for he governed the English church for twenty-two years. He brought with him a valuable library of Latin and Greek authors, among which were the works of Homer, and established schools of learning to which the clergy and laity repaired. The consequence was, according to Bede, that soon after this many English priests were as conversant with the Latin and Greek languages as with their native tongue.*

Scarcely, however, was the national faith thus settled, when controversies arose in the bosom of the infant church on certain points of ceremonial practice, the triviality of which, of course, did not prevent them from being agitated with as much heat and obstinacy as if they had involved the most essential principles of morality or religion. One of the subjects of dispute was the same difference as to the mode of computing Easter that had already prevented the union of the English and Welsh churches; it now in like manner threatened to divide the two kingdoms of Mercia and Northumberland, which, as already related, had been converted by Scottish missionaries, from the other states of the Heptarchy, which had received their instructors from Rome and France. To this was added the difference between the Romish and Scottish churches, upon the form of the ecclesiastical tonsure. While the priests of the former wore the hair round the temples in imitation of a crown of thorns, they were horror-struck at the latter, who, according to the custom of the Eastern church, shaved it from their foreheads into the form of a crescent, for which they were reproached with bearing the emblem of Simon Magus.† A council had been summoned with the view of accommodating these dissensions by Oswy, king of Northumberland, in the year 664; but the only result of this attempt was to increase the animosity of the two factions, the clergy of the Scottish persuasion, in fact, retiring from the assembly in dis-

* Bed. iv. 2.

† Theodore who, when he was called to the primacy, wore the eastern tonsure, was obliged to wait four months, that his hair might grow so as to be shaven according to the orthodox fashion. Bed. iv. 1.

gust.* The zeal and prudence of Theodore, however, triumphed over these difficulties. He visited the several churches throughout England, and so effectually employed authority and conciliation, that at a council called at Hertford, in the year 673, the bishops generally consented to the canons which he had brought with him from Rome, by which a complete agreement in faith and worship was established.†

Theodore now addressed himself with vigour to the vindication of his authority as primate of all England, a pre-eminence with which he contended the Archbishop of Canterbury had been invested by Pope Gregory, and in right of which he claimed for himself scarcely less than a papal supremacy over the British church. In the prosecution of this object he was involved in a long contest with Wilfrid, the Bishop of York, whose extensive diocese he wished to divide, on the pretext that it was too large for the superintendence of one man. But Wilfrid was not a character to submit tamely to such a stretch of power. Appealing from the Archbishop to the Pope, he set off for Rome, where he was graciously received; and he soon obtained a decree rescinding the partition of his bishopric. Though the papal mandate was so little regarded that King Egfrid, on Wilfrid's return, committed him to prison, yet this precedent was afterwards followed by ecclesiastical appeals to Rome, which terminated, as in other countries, in the universal supremacy of the Pope. Our limits do not permit us to trace the singular career of Wilfrid, so full of vicissitudes, or to delineate his character that apparently combined so many inconsistencies. With his haughtiness in power, and his restless ambition, he united, in the hour of adversity, the meekness and self-denial of an apostle. Being shipwrecked on his voyage to Rome upon the shores of Friesland, he embraced the opportunity of preaching the faith to the barbarous natives; and when driven into Sussex by the resentment of Egfrid, he there also, as already noticed, turned his ill-fortune to an occasion of usefulness, and, engaging with ready zeal in a new work of conversion, succeeded in gaining over to Christianity the last district in England in which the ancient superstition survived.

In the mean time, Theodore being delivered from the presence of so formidable an adversary, was enabled to proceed with his division of the larger dioceses. That of Mercia, in particular, which had till now embraced the whole of the state so called, was divided by King Ethelred, at his instigation, into the four dioceses of Lichfield, Worcester, Hereford, and Chester. Many other reforms were also prosecuted by the energetic Primate. He encouraged the wealthy to build parish churches, by conferring upon them and their heirs the right of patronage. The sacred edifices, till now for the most part of timber, began to give place to larger and more durable structures of stone; the beautiful chanting, hitherto confined to the cathedrals, was introduced into the churches generally; and the priests who had been accustomed, in the discharge of their office, to wander from place to place, had fixed stations assigned to them. They and the churches had as yet been maintained solely by the voluntary contributions of the people; but, because this was a precarious resource when the excitement of novelty had ceased, Theodore provided for the regular support of religion, by prevailing upon the kings of the different states to impose a special tax upon their subjects for that purpose, under the name of kirk-scot.* By these and similar measures, all England, long before the several kingdoms were united under one sovereign, was reduced to a state of religious uniformity, and composed a single spiritual empire. After living to witness many of the benefits of his important labours, this illustrious Primate died in 690, after a well-spent and active life of nearly ninety years.

The age of the Christian church in England that immediately succeeded its establishment was distinguished by the decline of true religion, and the rapid increase both of worldly-mindedness among the clergy, and of fanaticism and superstition among the people. From the humble condition of a dependence upon the alms of the faithful, the church now found itself in the possession of revenues which enabled its bishops to vie in pomp and luxury with the chief nobility, and even conferred no small consideration upon many of its inferior ministers. It is generally held that tithes were first imposed upon the Mercians in the latter part of the eighth century by their king Offa, and that the tax was extended over all England by King Ethelwulf, in 855. But the subject of this assumed donation of Ethelwulf to the church is involved in great obscurity.† All that is certain is, that in after ages the clergy were uniformly wont to refer to his charter as the foundation of their claim. The tithes of all England, however, at this early period, if such a general tax then existed, would not have been sufficient of themselves to weigh down the church by too great a burden of wealth. A great portion of the soil was still composed of waste or forest land; and the tithes appear to have been charged with the repair of churches, the expenses of worship, and the relief of the poor, as well as with the maintenance of the clergy. It was from the lavish benevolence of individuals that the church principally derived its large revenues. Kings, under the influence of piety or remorse, were eager to pour their wealth into the ecclesiastical treasury, to bribe the favour of Heaven, or avert its indignation; and wealthy thanes were in like manner wont to expiate their sins, as they were taught they might do, by founding a church or endowing a monastery. Among other consequences of these more ample resources, we find that the walls of the churches became covered with foreign paintings and tapestry; that the altars and sacred vessels were formed of the precious metals,

and sparkled with gems; while the vestments of the priests were of the most splendid description. Other much more lamentable effects followed. Indolence and sensuality took the place of religion and learning among all orders of the clergy. The monasteries in particular, founded at first as abodes of piety and letters, and refuges for the desolate and the penitent, soon became the haunts of idleness and superstition. Many of the nunneries were mere receptacles of profligacy, in which the roving debauchee was sure of a welcome.* In the year 747 the Council of Cloveshoe found it necessary to order that the monasteries should not be turned into places of amusement for harpers and buffoons; and that laymen should not be admitted within their walls too freely, lest they might be scandalised at the offences they should discover there.† Most of the monasteries in England, too, were double houses,‡ in which resided communities of men and women; and the natural consequences often followed this perilous juxtaposition of the sexes, living in the midst of plenty and idleness. These establishments also continued to multiply with a rapidity that was portentous, not only from the tendency of the idle and depraved to embrace such a life of indulgence, but from the doctrine current at the end of the seventh century, that the assumption of the monastic habit absolved from all previous sin. Bede, who saw and lamented this growing evil, raised a warning voice, but in vain, against it; and expressed his fears that, from the increase of the monks, soldiers would at last be wanting to repel the invasion of an enemy.§ Many nobles, desirous of an uninterrupted life of sensuality, pretended to devote their wealth to the service of Heaven, and obtained the royal sanction for founding a religious house; but in their new character of abbots, they gathered round them a brotherhood of dissolute monks, with whom they lived in the commission of every vice; while their wives, following the example, established nunneries upon a similar principle, and filled them with the most depraved of their sex.‖ To these evils was added the bitterness of religious contention. Men, thus pampered, could scarcely be expected to live in a state of mutual harmony; and fierce dissensions were constantly raging between the monks, or regulars, as they called themselves, and the seculars, or unmonastic clergy, about their respective duties, privileges, and honours.

It was natural enough that the grossest superstition should accompany and intermingle with all this gross profligacy. So many Saxon kings accordingly abandoned their crowns, and retired into monasteries, that the practice became a proverbial distinction of their race;¶ while other persons of rank, nauseated with indulgence, or horror-struck with religious dread, often also forsook the world of which they were weary, and took refuge in cells or hermitages. The penances by which they endeavoured either to expiate their crimes or attain to the honours of saintship, emblazoned though they are in chronicles, and canonised in calendars, can only excite contempt or disgust, whether they ascend to the extravagance of St. Gurthlake, who endeavoured to fast forty days after the fashion of Elias,* or sink to the low standard of those noble ladies who thought that heaven was to be won by the spiritual purity of unwashed linen. In addition to the feeling of remorse by which such expiations were inspired, a profligate state of society will multiply religious observances as a cheap substitute for the practice of holiness and virtue; and men will readily fast, and make journeys, and give alms, in preference to the greater sacrifice of amendment of life. We need not, therefore, wonder to find Saxon pilgrims thronging to the continent and to Rome, who do not seem to have considered a little contraband traffic, when opportunity offered, as detracting from the merits of their religious tour; while ladies of rank, who undertook the same journey, frequently parted with whatever virtue they possessed by the way.†

While such was the state of the English church, the invasions of the Danes commenced at the end of the eighth century, and were continued in a succession of inundations, each more terrible than the preceding. These spoilers of the north, devoted to their ancient idolatry, naturally abhorred the Christianity of the Saxons, corrupted though it was, as a religion of humanity and order; and as the treasures of the land, at the first alarm, were deposited in the sacred edifices, which were fondly believed to be safe from the intrusion even of the most daring, the tempest of the Danish warfare was chiefly directed against the churches and monasteries. Those miracles lately so plentiful, and so powerful to deceive, were impotent now to break or turn back the sword of the invader. The priest was massacred at the altar; the monk perished in his cell; the nuns were violated; and the course of the Northmen might be traced by the ashes of sacred edifices, that had been pillaged and consumed. The effects of these devastations upon both religion and learning may be read in the mournful complaint of Alfred. At his accession, he tells us, in the interesting preface to his translation of Pope Gregory's tract on the Duties of Pastors he could find very few priests north of the Humber, who were able to translate the latin service into the vulgar tongue; and south of the Thames, not one.

After the land had begun to recover from the immediate effects of this visitation, and the church had resumed its wonted position, the celebrated Dunstan appeared. He was born in Wessex, about the year 925. Although he was of noble birth, and remotely related to the royal family, as well as connected with the church through two uncles, one

of whom was primate, and the other bishop of Winchester, these signal advantages were not deemed enough for the future aspirant to clerical supremacy, without the corroboration of a miracle. His career was, therefore, indicated before he was born. While his mother Cynedrith attended divine service, in the church, at the festival of Candlemass, the lights which the worshippers carried were suddenly extinguished, and a supernatural darkness involved the whole building. But in the midst of the consternation which such a portent excited, her candle was rekindled by fire which seemed to descend from heaven. Of course, the interpretation was easy, and all were thus taught what a light would proceed from her, to illuminate the church and kingdom.* While a boy, he was also honoured by divine manifestations. The church of Glastonbury, still humble in its dimensions, needed enlargement, and sought it at the hands of the embryo saint; for this purpose, a venerable man appeared to him in a vision, led him over the building, explained the scale on which it was to be enlarged, and stamped the whole plan so indelibly upon his mind, that he could not forget it. His early studies having been pursued with an intensity that soon exhausted his feeble constitution, a fever ensued, and, under the delirium it produced, he escaped from his bed during the night, and hurried to the church. Having found the doors locked, he scaled the walls by the help of a ladder, reached a scaffolding—the building being under repair—and safely descended into the body of the church, where he was found asleep next morning. His fortunate escape from the danger of an attempt upon which no sane person would have ventured, appeared to others, and perhaps to himself, as nothing less than miraculous; and his restored health, which the excitement might have produced, gave countenance to the supposition. The story was, therefore, amplified and embellished in the spirit of the age. It was an angel that had visited his couch by night, and suddenly restored him to health. An impulse of holy gratitude had hurried him to church, that he might return thanks to heaven for the miracle; but here, it was added, his adversary, the devil, accompanied by his dogs, had opposed his path, and endeavoured to drive him back; however, the intrepid youth, with pious ejaculations and a staff, routed the fiend and his formidable hell-hounds, when angels came to his aid, and wafted him into the church in safety.

Thus heralded in his career, Dunstan was careful to omit no efforts on his own part that might aid his claims to the character he proposed to assume; and therefore he accomplished himself in all the learning that might give him an influence in society. He was an excellent composer in music; he played skilfully upon various instruments; was a painter, a worker in design, and a calligrapher; a jeweller and a blacksmith. After he had taken the clerical habit, he was introduced by his uncle Adelm, the primate, to king Athelstane, who seems to have been delighted with his music.* But Dunstan's character for saintship, attested though it had been, was still imperfect. To his other endowments, he had added a familiarity with the heathen songs of the ancient Saxons; and this acquisition was considered by many as not a little unprofessional and profane. A miracle that would have canonized him in the cloister, almost brought about his ruin in the court. Upon one occasion, when he had hung his harp upon the wall, it was heard to utter, of itself, the words and tune of an anthem. Whether this effect was produced by ventriloquism on the part of Dunstan, or an excited imagination in the hearer, or whether the harp was one of those called Æolian, of which the circumstance has obtained for him, with some, the credit of being the inventor, it is impossible to conjecture; but if he here actually attempted a miracle, the occasion was ill chosen, and the effect unfortunate. The courtiers, who envied him the favour of the king, loudly denounced him as a dealer in sorcery, and procured his expulsion from the court; and, not contented with this victory, they pursued him, bound him hand and foot, trampled upon him, and threw him into a marsh, where they left him to perish. He escaped, however, from this imminent peril, and sought refuge with his uncle, the bishop of Winchester.

A new scene now opens in the life of this extraordinary person. Contiguous to the church of Glastonbury he erected a cell, five feet in length by two in breadth, the floor of which was sunk beneath the surface, while the roof, on the outside, was only breast high, so that he could stand upright in it, though unable to lie at full length. This strange *sepulchre*† was at once his bed-chamber, his oratory, and his workshop; and it was here that one of his most celebrated combats with the prince of darkness took place. One evening, while the saint was employed at his forge, the devil thrust his head in at the window, and began to tempt him with some immoral propositions. Dunstan patiently endured the annoyance until his tongs were red-hot in the fire, when, snatching them suddenly up, he seized with them the nose of the foul fiend, who bellowed in agony till the neighbourhood resounded with his clamour. Such were the gross ideas at this time entertained of the nature and agency of spirits. In this and many similar legends Satan appears merely as the clown in the pantomime, and generally to be outwitted and baffled.‡ By all this mortification Dunstan gradually repaired the error or misfortune into which he had fallen. His character for sanctity became

* Osbernus de Vit. S. Dunst. in Anglia Sacra, ii. p. 90; et Eadmer in Vit. Dunst., ibid., ii. 213.

* "Iterum cum (Dunstanus) videret dominum regem sæcularibus curis fatigatum psallebat in tympano sive in cythara," &c. Osberne.

† So Osberne, who had seen the cell, is pleased to term it, after describing its dimensions.

‡ In the narrative of Dunstan's feat, the cry of Satan, at his departure, was, "O quid fecit calvus iste! O quid fecit calvus iste!" Anglia Sacra, ii. 97. In another conflict the saint struck the devil so fiercely with his pastoral staff that it broke in three pieces. Ibid. p. 105.

more illustrious than ever; and Ethelfleda, a noble lady who occupied a cell near his own, made him, at her death, her sole executor. He distributed the personal property among the poor, and bestowed the lands upon the church of Glastonbury, endowing that establishment at the same time with the whole of his own patrimony, which had lately fallen to him. His ambition, indeed, however inordinate and reckless, was certainly of too lofty a character to stoop to lucrative considerations.

Ruins of Glastonbury Abbey, as they appeared in 1785;—St. John's Church, and St. Michael's Tower, on the Torr Hill, in the Distance.

Edmund having now succeeded to the throne, Dunstan was recalled to court; but, in spite of his recent exploits and penances, he was still opposed by the courtiers, who probably saw his ambition, and dreaded his talents. Their intrigues again procured his dismission, but once more he was recalled through the opportune interference of a miracle; and the king not only made him Abbot of Glastonbury, but greatly increased the privileges of that monastery. Edred, the successor of Edmund, showed him equal favour, and would have made him bishop of Crediton; but Dunstan, who seems to have contemplated a still higher elevation, refused the offer. The following day he declared that St. Peter, St. Paul, and St. Andrew had visited him in the night in a vision; and that the last, having severely chastised him with a rod for rejecting their apostolic society, commanded him never to refuse such an offer again, *or even the primacy*, should it be offered him; assuring him, withal, that he should one day travel to Rome.

It is probable that Dunstan's ultimate aim all this while was to effect what he deemed a reformation of the church, and that, according to the morality of the times, he justified to himself the means to which he resorted by the importance of the object he had in view. The ecclesiastical reformation to which his efforts were directed was such as might have been expected from his character. A fierce champion for the fancied holiness of celibacy, he determined to reduce the clergy under the monastic yoke; and, as during the late political troubles many both of the secular and the regular priests had married when they were driven from their homes, he insisted that those who had so acted should put away both their wives and families. Those clergy also who dwelt with their respective bishops were required to become the inmates of a monastery. In these views he was happy in having for his coadjutor Archbishop Odo. This personage, born of Danish parents, and distinguished in the early part of his life as a soldier, retained ever after the firmness and ferocity of his

PORTRAIT OF DUNSTAN IN FULL ARCHIEPISCOPAL COSTUME. From an Illumination in the Cottonian MS. Claud. A. iii.

first calling. We have already related the part he acted along with Dunstan in the tragedy of the unhappy Elgiva. When Dunstan, soon after this, was obliged to fly from England on being accused of embezzlement in the administration of the royal revenues, it is related that while the officers were employed at the Abbey of Glastonbury, in taking an inventory of his effects, his old adversary, the devil, made the sacred building resound with obstreperous mirth at the discomfiture of its abbot. But Dunstan checked his triumph by the prophetic intimation of a speedy return.* He then hastened to leave the kingdom, and was so fortunate as to escape the pursuit of the queen's messengers, who, it is said, were commissioned to put out his eyes.

The death of Edwy immediately brought about the recal of Dunstan, and the restoration of his influence, and he was appointed by Edgar Bishop of Worcester, in 957. Three years afterwards, on the death of Odo, he was promoted to the Archbishopric of Canterbury, when, according to custom, he repaired to Rome to receive the pall at the hands of the Pope, thus fulfilling the prediction of his vision.

He was now possessed of unlimited ecclesiastical authority; and though he no longer enjoyed the powerful co-operation of Odo, he was seconded by the no less zealous efforts of Oswald and Ethelwald, the former of whom he had promoted to the see of Worcester, and the latter to that of Winchester, and both of whom were afterwards canonized with their principal. He had also the superstitious Edgar under his control, and afterwards the youthful Edward. Being thus surrounded with political and spiritual coadjutors, he proceeded with merciless zeal in his projects of reformation, and alternately adopted force and stratagem for the accomplishment of his purposes. The clergy were now imperiously required to dismiss their wives and conform to the law of celibacy, or resign their charges; and when they adopted the latter alternative, they were represented as monsters of wickedness by whose presence the church was polluted. The secular canons were driven out of the cathedrals and monasteries, and their places were filled with monks. On one occasion Ethelwald entered his cathedral during the celebration of mass, and causing his servants to throw a heap of cowls which they had brought with them upon the floor, he commanded the astonished canons to assume these habits or resign. In vain they pleaded for time to deliberate; the command was imperative, and must be instantly obeyed. Eventually a few only complied with the haughty mandate.* Miracles were necessary for such obstinate recusants, and therefore, besides the wonderful legends that were devised and propagated in praise of St. Bene-

* Anglia Sac. ii. p. 105.

* Eadmer in Anglia Sac. ii. p. 219.

dict and his institution, the Archbishop vouchsafed to them a sign for their conviction. A synod having been held at Winchester in 977, at which the canons hoped that the sentence against them would be reversed, all at once a voice issued from a crucifix in the wall, exclaiming, "Do it not! do it not! you have judged well, and you would do ill to change it." * This miracle, however, so far from convincing the canons, only produced confusion, and broke up the meeting. A second meeting was held, but with no better result. A third was appointed at Calne, and there a prodigy was to be exhibited of a more tremendous and decisive character. The opponents of Dunstan had chosen for their advocate Beornelm, a Scotch bishop, who is described as a person of subtle understanding and infinite loquacity. Dunstan, perplexed by the arguments of such an antagonist, produced his final demonstration. "I am now growing old," he exclaimed, "and you endeavour to overcome me. I am more disposed to silence than contention. I confess I am unwilling that you should vanquish me; and to Christ himself, as judge, I commit the cause of his church." At these words, the floor suddenly gave way, and fell to the ground with his adversaries, of whom some were crushed to death, and many grievously injured, while the part which Dunstan occupied, with his adherents, remained unmoved. It is no violation of charity to suspect, from this incident, that the archbishop was skilled in the profession of the carpenter as well as in that of the blacksmith.

Dunstan lived for ten years after this sanguinary deception, and spent them in still prosecuting his favourite schemes of ecclesiastical reform. His last moments are irradiated in the legend of his life by a whole galaxy of miracles; but enough of this sort of matter has been already quoted. He died in the reign of Ethelred in A.D. 988.

The history of the Anglo-Saxon church, from the death of Dunstan to the Norman conquest, presents little to interest the general reader. The cause for which Dunstan and his coadjutors had laboured remained completely in the ascendant; monasteries continued to be founded or endowed in every part of the kingdom; and such were the multitudes who devoted themselves to the cloister, that the foreboding of Bede was at length accomplished—above a third of the property of the land was in possession of the church, and exempted from taxes and military service. It is probable that an increase of superstition of a certain kind was one of the consequences of the invasions of the Danes. In a canon of the reign of King Edgar we find the clergy enjoined to be diligent in withdrawing the people from the worship of trees, stones, and fountains, and other heathen practices which are therein specified; and the laws of Canute prohibited the worship of heathen gods, the sun, moon, fire, rivers, fountains, rocks, or trees; the practice of witchcraft, or the commission of murder by magic, firebrands, or any infernal devices. The penitential by some ascribed to Dunstan requires that penitents shall confess whatever sins have been committed by their bodies, their skin, their flesh, their bones, their sinews, their veins, their gristles, their tongues, their lips, their palates, their hair, their marrow—by everything soft or hard, moist or dry. The penances imposed upon the laity for their sins had a reference to the spirit of the age and people. They chiefly consisted in a prohibition from carrying arms; in abstinence from flesh, strong liquors, soft beds, and warm baths; in not polling the head and beard, or paring the nails; and if they were rich, they were required to build and endow monasteries. Some of the prescribed fastings would appear intolerable, but for the methods which they had discovered of vicarious penance in this particular. The abstinence of another, which might be obtained by purchase, was carried to the account of the offender; so that he upon whom was imposed a cessation from food for seven years, might finish the whole in three days, if he could procure eight hundred and fifty men to fast along with him on bread, water, and vegetables. Exemption, too, was to be directly bought at a stipulated price; so that a year's fasting would be remitted on payment of a fine of thirty shillings to the church.

In the canons of Elfric, who was Archbishop of Canterbury from 995 to 1005, we learn that there were seven orders of clergy in the church, whose names and offices were the following:—1st. The Ostiary, who took charge of the church doors and rang the bell. 2nd. The Lector, or reader of Scripture to the congregation. 3rd. The Exorcist, who drove out devils by sacred adjurations or invocations. 4th. The Acolyth, who held the tapers at the reading of the gospels and the celebration of mass. 5th. The Sub-deacon, who produced the holy vessels, and attended the deacon at the altar. 6th. The Deacon, who ministered to the mass-priest, laid the oblation on the altar, read the gospel, baptized children, and gave the eucharist to the people. 7th. The Mass-priest, or Presbyter, who preached, baptized, and consecrated the Eucharist. Of the same order with the last of these, but higher in honour, was—the Bishop.

During this long period the history of the Church of Scotland is involved in much obscurity. While the remoteness and barbarism of the country, however, protected it from the extending influence of Rome, it appears that the Culdees diffused themselves over the territory to the south as well as over that to the north of the Grampians, and in course of time came to form exclusively, or almost exclusively, the national clergy. Of either the doctrines or ecclesiastical government of the Culdees we know little positively, although the subject has given rise to a great deal of angry disputation. But it would appear that whatever may have been the principles of their founder, Columba, they eventually came to be considered as opposed to many of the claims of the Roman see.

* Anglia Sac. ii. pp. 112 and 219.

On this account, although a great part of the north of England was converted by missionaries sent from Iona, it was decreed at the Council of Cealhythe, in the year 816, that no Scottish priest should for the future exercise his functions in England. The English writers of that age, nevertheless, bear testimony to the purity of their lives and the zeal of their apostolic labours, while they denounce their exclusive devotedness to the authority of Scripture, their rejection of the Romish ceremonies, doctrines, and traditions, the nakedness of their forms of worship, and the republican character of their ecclesiastical government. It has been maintained also by some Protestant writers that the Culdees rejected the practice of auricular confession, and various other points of ceremony and doctrine peculiar to the Romish church. It is certain that, as had happened in every part of the Christian world, even those of them who belonged to monasteries came at length to marry, although there is much reason to suspect that this was a corruption of the rule originally established by St. Columba. The office of Culdee in Scotland would even in some cases appear to have become hereditary. The attitude of opposition into which the Scottish priests were thrown, by circumstances, to the English church founded by Augustine and his companions upon the Roman model, naturally fixed them to the maintenance of their own creed, worship, and discipline, and consolidated their church into an establishment nearly if not altogether independent of that of Rome. Their separation from the Roman church, and opposition to its doctrines, was so strong, that Margaret, the Anglo-Saxon queen of Malcolm Canmore, was shocked, on her arrival in Scotland, to find the faith and worship of the people so different from the rules of that church in which she had been educated. She therefore endeavoured to rouse, against what she considered a profane schism, the influence of her husband, and for a time succeeded; but the Scottish church appears to have reverted, after her death, to its former condition. It is from the debates which she held with the king upon the subject that we learn a considerable portion of the little we know respecting the religious opinions of the Culdees.*

CHAPTER III.

HISTORY OF THE CONSTITUTION, GOVERNMENT, AND LAWS.

THE Roman civilization, such as it was, passed away, and a long, dreary tract of disorder and darkness succeeded. Yet that chaotic mass which then constituted society contained the elements of modern European civilization; and in proportion to that very confusion, to the number and heterogeneous character of the component elements of that chaos, are the richness and completeness of the civilization which has been the result of them. Our business in the present chapter is with the particular element that belonged to those wild, free, warlike barbarians who, in the fifth and sixth centuries, overran and conquered the larger portion of the Roman world.

"Tacitus," says M. Guizot, "painted the Germans, as Montaigne and Rousseau did the savages, in a fit of spleen against his country; his book is a satire upon Roman manners; the eloquent outbreak of a patriot philosopher who desires to see virtue there where he does not find the disgraceful effeminacy and elaborate depravity of an old society."* Not that M. Guizot infers that Tacitus stated facts that were inaccurate. On the contrary, he admits that all subsequent inquiries have gone to prove the general accuracy of his statements. But from

* Guizot, Cours d'Histoire Moderne, tom. ii. p. 253.

the circumstance above alluded to, what Guizot calls the moral colouring of the picture has in it somewhat of a false and misleading tinge. Several German writers in modern times have followed the course of Tacitus, though from a motive different from his, giving a highly-coloured picture of the virtues of their rude ancestors, who differed, however, as is satisfactorily shown by M. Guizot, very little from other communities similarly situated.

We perceive among the Saxons, as among other Germanic tribes, the germs of three great systems of institutions which, from the fall of the Roman empire, have divided Europe amongst them.—1. Assemblies of freemen, in which the common affairs of the nation are debated. 2. Kings; some hereditary, others elective. 3. The principle of aristocratic patronage; either of a military chief over his companions in arms, or of a landed proprietor over his family and his husbandmen.*

When the bands of Saxons arrived and took possession of any tract of country, the chiefs appropriated to themselves extensive domains, while the larger portion of the warriors who accompanied them continued to live around them. Gradually, however, the distance between the chief and his companions—at first not very great—increased, partly from the circumstances natural to their respective positions, and partly from a circumstance upon which it will be necessary to bestow a few words of explanation.

The only kings of the continental Saxons appear to have been temporary leaders, appointed to hold the general command in time of war. This is the statement made by Cæsar respecting all the German nations in his time, and it is repeated nearly eight centuries afterwards by Bede as still applicable to the Saxons who remained in their original seats. The king, according to Bede, when a war broke out, was elected by lot from among the chiefs: as soon as the war was ended, all the chiefs became again of equal power. In like manner, there is every reason to believe, the first kings of the Saxons in England were merely the captains of the several invading bands, or those appointed to succeed them in the conduct of the war with the Britons. The long continuance of that contest first made the office permanent, and converted the military commander into the supreme magistrate of his nation. The Saxon word *cyning*, of which our modern *king* is an abbreviation, appears to have meant the offspring or creature of the community.† That in early times, among the Anglo-Saxons, the person of the king was not sacred, is proved by the fact that the law afforded him the same security (in kind, though different in degree) for his life that it did to the meanest of his subjects. It gave him the protection of his weregild,—that is, a certain pecuniary value put upon his life,—and nothing more.

We have said that the Roman civilization passed away; but it was not probable that that vast power which had overshadowed the earth for so many centuries with its mighty wings should disappear, like the unreal fabric of a dream, without leaving a wreck behind. On the contrary, the Roman empire left marks that are indelible, not merely such as, like the vast material relics of its greatness, only affect the senses, but such as sink deep into the mind and influence the actions. Those things borrowed by the northern nations from the Roman civilization, which are most important to be here noted for their effect on modern European civilization were, 1st. the idea of imperial power; and, 2nd. the municipal institutions.

This idea of imperial power found much favour in the sight of our Anglo-Saxon kings, as it did in that of their Teutonic brethren in whatever part of the earth they had succeeded the Roman occupants of the soil.

But though the Anglo-Saxon princes might assume some of the external insignia, they had but little of the substance of the imperial sovereignty. The Anglo-Saxon government would seem to have been an aristocracy in a somewhat wide meaning of the term. Thus, instead of the purely monarchical form of the Roman imperial legislation, their style runs thus: "Ego Dei gratia, &c. cum consilio et cum doctrina—Episcopi mei, et—Episcopi mei, et cum omnibus meis Senatoribus, et Senioribus sapientibus populi mei, et multa cum societate ministrorum Dei," &c. &c.—that is, "I, by the grace of God, &c., with the advice and consent of certain of my bishops (naming them), and along with all my senators and the wise elders of my people, and a large associated number of the ministers of God," &c. Whence it appears that the laws were made by the king and a national assembly or parliament, composed of the nobility and others. This was called the Witenagemot,—literally, the meeting of the wise men; but before proceeding to examine its constitution, it will be necessary to say a few words respecting the several classes of the Saxon population.

As the Saxons conquered Britain, every warrior obtained a number of captives, and a portion of land, proportioned to the services which he had performed. It is at least probable, however, that something similar took place in Britain to what is known to have happened in other parts of the Roman empire, where, on the settlement of the northern conquerors, though of the former inhabitants many were reduced to slavery, many retained their liberty; and though the estates of some were totally confiscated, in general the vanquished were left in possession of part of their land. This was the mode adopted by the Burgundians in Gaul, the Visigoths in Spain, and the Ostrogoths in Italy.* Owing to the vigorous opposition made by the Britons, which was much beyond what the conquerors had to encounter in other parts of the Roman empire, such as Gaul and Italy, a much larger

* Guizot, Cours d'Histoire, tom. ii. p. 268.
† Allen's Inquiry into the Rise and Growth of the Royal Prerogative in England, 8vo. 1830.

* Allen's Inquiry, pp. 138—9.

number of invaders, in proportion to the native inhabitants, was required to effect the conquest than in the case of Gaul. This would be one good reason, even if no other could be found, for the ordinary divisions of land among the Saxon conquerors not being very large ones; and we find accordingly that the land was divided into "hides," each comprehending as much as could be cultivated by a single plough. It is likely that this circumstance may have something to do with the more popular character of the Anglo-Saxon institutions as compared with those of their continental brethren, whether remaining in Germany or transplanted to France and Italy.

When the estate of an Anglo-Saxon was large, one part of it was occupied by the kindred and free retainers of the proprietor, who gave in return military service; another part was parcelled out into different farms, and committed to the management of particular bondmen, from whom, at the end of the year, he required an account of the produce. The former came eventually to receive the name of "vassals," the latter of "villains."

The distinction between the original proprietor and his vassals gave rise to the division of landed estates into "allodial" and "feudal," the former being those held without, the latter those held with, a lord superior. The feudal estates, *beneficia*, or fiefs, or feuds, appear to have been held originally during the pleasure of the superior, then for a determinate time, afterwards for life, and at length to have become hereditary. M. Guizot, who has treated this subject with his usual ability and research, has come to the following conclusions:—1. Originally the grants were generally made in usufruct and for life, provided that the grantee remained faithful to the grantor. 2. The course of events constantly tended to render them hereditary.* We may here add that the constant tendency also was, during the turbulence of the middle ages, to convert allodial into feudal property, in consequence of the more effectual protection afforded by that description of tenure. †

Connected with this subject is the celebrated Saxon distinction of land into "folcland" and "bocland," upon which Mr. Allen has the merit of having thrown a considerable quantity of new light. When the Saxons had secured a territory, after appropriating certain portions to individuals according to their claims (as stated above), they considered what remained as belonging to the state or community at large, and called it "folcland," which is interpreted by Spelman "terra popularis," that is, the land of the public. ‡ It corresponded to the *fisc* of the continental nations. When a particular portion of land was severed from the folcland, and appropriated, provided the conveyance was made by a written instrument, it received the name of "bocland." The proprietor of bocland, unless specially fettered, appears to have had an unlimited power to dispose of it as he chose. Moreover, when once severed from the folcland or property of the community, whatever were the burdens and services imposed upon it, provided it was alienated by writing, an estate received the name of bocland.* However, it is, as Mr. Allen remarks, not quite correct to say that all the lands of the Anglo-Saxons were either folcland or bocland, because land was not properly bocland unless conveyed by a written instrument, and at an early period conveyances were made by the delivery of a staff, a spear, an arrow, &c.

That the Anglo-Saxon kings had private property in land, that is, bocland, is decisively proved by the will of King Alfred, still extant. When the kings in process of time began to be considered as the representatives of the state, the term *terra regis*, or crown land, took the place of the word folcland. This is the *terra regis* of Domesday.† In time the bocland, or private estate of the king, came to be mixed up with it.

The Anglo-Saxons, like the other Teutonic nations, were divided into various castes. The highest of these was that out of which their kings were taken; for though the Anglo-Saxon kings were elective, not hereditary, they were usually chosen out of a certain particular family or race. The Anglo-Saxon chieftains of this family were all descended from the deified monarch of the Asi, Odin or Woden. "It may be admitted," observes Sir Francis Palgrave, "that their proud genealogies had no foundation in truth." ‡ Nevertheless these pretensions of theirs may probably have had some share in originating the Divine right doctrine of later times.

The second great caste among the Anglo-Saxons were the nobility, who bore the title of eorls, or eorlcundmen, or thane-born. § The pervading principle, as we have already remarked, of the Anglo-Saxon government, was aristocratic. But among the Anglo-Saxons, nobility, to have its full pre-eminence, required the addition of property. Noble birth, though it raised a man above the condition of villainage, did not place him on a level with those who possessed land in absolute dominion, as well as nobility of birth. We have already spoken of the system of hlafords and men, or, in the feudal phrase, lords and vassals. If a noble did not possess the property sufficient to constitute a lordship, he was then "ranked," says Sir Francis Palgrave, "in the very numerous class, whose members in Wessex and its dependent states were originally known by the name of Sithcundmen; an appellation which we may paraphrase by the heraldic expression of 'gentle by birth and blood.'" The Sithcundman appears to have originally had the privilege of choosing his own lord or superior. After the reign of Alfred, the Sithcundmen came to be commonly known by the name of Sixhaendmen,—a denomination, as Sir Francis

‡ Rise and Progress of the English Commonwealth, vol. i. part i. p. 10. § Ibid. p. 11.

Palgrave remarks, "indicating their position between the highest and lowest law-worthy classes of society;"—the former, the landed nobility, being called Twelfhaendmen; the latter, forming the third caste, Twihaendmen.

This third caste was composed of the remainder of the people, and consisted of the ceorls, or villains, already mentioned. The distinctions between the eorl and the ceorl were numerous and strongly marked. The declaration of one eorl was equal to that of six ceorls; the life of one eorl was equal in value to the lives of six ceorls; and so for other matters in proportion.* The ceorls were known by various other names, of which Sir Francis Palgrave quotes several. "But," he continues, "the ceorl or villain, however named, may be defined as a tenant ascribed to the glebe; one who, performing prædial or agricultural services, was unable to depart from the land which he held; and who, either by law or by long established custom equivalent to law, had acquired a definite and recognised estate in the soil. So long as the villain performed his services he was not to be removed from his land, nor was a higher rent or a greater proportion of labour to be exacted from him than what was due and of right accustomed."† And yet the ceorl was in some sense free. Nevertheless, "a ceorl thus circumstanced—a freeman—could, according to the legal language of the Anglo-Saxons, be given and bequeathed, bought and sold. These expressions, which sound so harsh, and seem so inconsistent with any degree of personal liberty, bore, however, a meaning differing essentially from that which we should now assign to them. In no instance can we find the ceorl separated from his land,—*he was always a villain appurtenant;* and, notwithstanding the language which was employed, it must be understood that the gift, the bequest, or the sale, was in effect the disposition of the land and of the ceorl, and of the services which the ceorl performed for the land; all of which passed by virtue of the will or the charter,—a transaction widely differing from the transfer of a slave, whose person is the subject of the purchase. The assertion, therefore, not unfrequently made, that a great proportion of the population of England was in a state of absolute servitude, cannot be warranted; and the most convincing proof that the rights of the lord over the ceorl and his goods and chattels, however burdensome, were limited and certain, is founded in the fact that the ceorl, even when in actual vassalage, could purchase his own freedom and the freedom of his wife and offspring: he, therefore, had the means of acquiring wealth, and the power of retaining it."‡ This last fact does not prove so much, we think, as Sir Francis supposes. The slaves of the Spaniards in some of their West India settlements had the same privilege; yet it will scarcely be thence inferred that the rights of their masters over them, while in actual slavery, were limited. The ceorls were entirely destitute of political power,* and consequently *their* rights could not, however well ascertained, be very well protected.

It has been doubted whether the ceorls were generally of British or Saxon origin. Sir Francis Palgrave, who has examined the subject with care, seems to incline to the supposition "that the ceorls were originally the British cultivators of the soil, but into whose class individuals and families of Anglo-Saxon birth and blood may have been from time to time aggregated and introduced."†

The Theowes, the Servi of Domesday, were entirely destitute of political rights,—they did not rank among the people. Their condition was similar to that of the negro or the Roman slave. Some of the theowes may have been the offspring of British serfs, but by far the greatest portion consisted of freemen who had forfeited their liberty by their crimes. "A culprit who could not discharge the penalty or wite, became a wite theow. He might be redeemed by his kinsmen; but if he was abandoned by them,—if, in the words of the law, he clasped his hands, and knew not who should make amends for him, then slavery was his doom."‡ During one year he might be redeemed, but not afterwards.

There is much discrepancy and confusion among writers on the subject of the territorial divisions of the Anglo-Saxons. What is tolerably certain is, that the division of the country into counties, hundreds, and tithings, goes back to the first age of the settlement of the Saxons in England. Over each of these territorial divisions there presided a magistrate: over the county a count, earl, or alderman: over the hundred a centenary, or hundreden: over the tithing a decanus, or tithingman.

There prevailed at one time pretty generally an opinion§ that the tithing consisted of ten families, and consequently the hundred of a hundred families. This opinion Professor Millar has, we think, succeeded in showing to be erroneous.‖

Each of these officers held a court, in which justice was administered, and all the affairs of the district discussed. In these courts the military assemblies to provide for defence against a foreign enemy were held. There also took place sales and many other transactions in which publicity was of importance.¶

These courts were subordinate one to another; so that from the decision of that of the tithing there lay an appeal to that of the hundred, and from that of the hundred to that of the shire.

These courts were at first held frequently, and by all the allodial proprietors of each district.**

** Millar, ib.

On the continent the vassals of the king or of the count were called upon to be present as well as the allodial proprietors;* and probably this was also the case in England as soon as feuds were introduced there. The power of the court belonged to the assembly, not to the magistrate. The function of the magistrate was limited to convoking the assembly and presiding in it. "It is now," observes M. Guizot, "a fact agreed upon among the writers the most versed in the antiquities of the modern nations, that the free men, *ahrimanni, rachimburgi, boni homines* (Anglice, '*good men and true*') present in the assembly of the hundred or the county, alone judged the causes, *in point of law as well as in point of fact;* that the count or centenary had no other function but to convoke the meeting, to preside in it, and cause its judgments to be put in execution."†

We see, then, that the institution of tithings, of hundreds, and of counties or shires, was not confined to England, but had place in most, if not all of the feudal countries. To this we would add a remark of M. Guizot,—that the graduated organization of the local courts above described is no more than the application to their new situation of the old principles, according to which the Germans governed themselves in Germany. We shall see by and by the great importance of the knowledge of the above fact towards the solution of the question, how it happened that principles of liberty and popular institutions were found in England at a time when they were utterly unknown in almost every other European country.

There is one regulation connected with the administration of justice among the Anglo-Saxons that has excited a good deal of attention. "The members of every tithing," says Professor Millar, "are said to have been responsible for the conduct of one another; and the society, or its leader, might be compelled to make reparation for an injury committed by any individual. If we look upon a tithing as regularly composed of ten families, this branch of its police will appear in the highest degree artificial and singular; but if we consider that society as of the same extent with a town or village, we shall find that such a regulation is conformable to the general usage of barbarous nations, and is founded upon their common notions of justice."‡ Professor Millar then shows that a similar custom prevailed among the Jews, among the Scottish Highlanders, among the ancient Irish, among the ancient inhabitants of Hindostan, and among various other tribes of human beings in a similar stage of civilization; and he arrives at the conclusion that this noted regulation concerning the Saxon tithings is to be regarded as the remains of extreme simplicity and barbarism, rather than the effect of uncommon refinement or policy. The Professor supports this view by observing, that as civilization advanced somewhat, the original obligation imposed upon every tithing to repair the injuries committed by any one of its members, was subsequently subjected to certain limitations, and this among the Anglo-Saxons themselves; for, by a law ascribed to William the Conqueror, but which is probably of an earlier date, it is enacted, that if a crime is committed by any member of a decennary, who escapes from justice, his tithingman, with two others of the same tithing, together with the respective tithingmen, and two others, out of the three neighbouring tithings, shall assemble to examine the state of the fact; and if the tithing to which the criminal belongs is cleared by the oath of these twelve persons, it shall be freed from the obligation to pay the damage.*

Mr. Hallam, however, does not agree with the view taken of this subject by Professor Millar. He thinks there is not a complete analogy between any of the cases cited by the Professor and that of the Anglo-Saxons. He enumerates, by reference to the Anglo-Saxon laws, the gradual stages through which the system of frank-pledges seems to have passed; and he comes to the conclusion that "the obligation of the tithing was merely that of permanent bail, responsible only indirectly for the good behaviour of their members."† There is no very great difference between this conclusion and the view of Mr. Millar, as stated above, made apparent to our perception. Professor Millar, however, it must be admitted, in the portion of his work devoted to the Anglo-Saxons, deals far too much in conjecture; not above one-fourth of his volume devoted to that subject rests upon unexceptionable evidence.

The system of "frank-pledge" is considered by Sir Francis Palgrave as divided into two branches: the first being the seignorial or personal liability of the superior, which rendered him the permanent surety for the appearance of his vassal, retainer, or inmate; and the second the collective or mutual responsibility of the villainage, as included in their tithings;—"associations," adds Sir Francis, "which, in the Saxon era, were of unequal extent, according to the custom of the country, ten being the smallest number of which a tithing could be composed, and from whence it derived its name."‡

The earl or alderman of the shire had a deputy, called in Latin *vice comes*, and in English the sheriff, shrieve, or shire-reeve. In some counties there was an intermediate division between the shire and the hundred,—as lathes in Kent, and rapes in Sussex. These had their lathe-reeves and rape-reeves. When a county was divided into three of these intermediate jurisdictions they were called trithings. These still subsist in the county of York, corrupted into ridings; the north, the east, and the west riding.

The subject of the constitution of the Anglo-Saxon legislature is involved in great obscurity.

* Guizot, ib. Lex Alam. tit. xxxvi. cap. 4, 5.

‡ English Commonwealth, vol. i. part i. page 192.

It is probable that whatever assemblies exercising the function of legislation existed among the Saxons and the other northern nations, they were, in their first conception, merely courts of justice, or at least had been established and had originally met chiefly for the administration of the laws. The institution of a legislative or law-making body is an idea so far from being obvious or natural to an early state of society, that it is opposed to the whole political system and notions of national government which then prevail. Every people has received its first laws either from what it has believed to be the authority of heaven itself, or from some other authority which it has felt nearly as little disposition to disobey or question. For a long period the laws thus received are held to be something sacred, and nobody thinks of abolishing or altering them, any more than he would think of attempting the amendment of the laws of nature. Even when circumstances at length force on innovations, the change of the law is the last change that takes place. It does not precede and prescribe the new practice, but only, reluctantly as it were, follows and sanctions it. In this way is slowly produced in the general mind the first notion of the possibility of mending the old laws or making new ones —the first conception of legislation. And even after the first exercise of the power has been thus brought about, the act of legislation is for a long time only timidly and sparingly indulged in; there is still something of a superstitious aversion to it, as if it were a proceeding interdicted by religion or by nature; only the most pressing necessity is held, and scarcely held, to justify it; the form of the old law is often retained after its spirit has been departed from; even a new law is made to wear as much as possible the appearance of an old law revived. In short, in every way the bearing of the legislation is towards the conservation rather than the improvement of the law; it affects to be not law-making but only law-declaring.

This character is traceable nearly throughout the whole course of English legislation, and in the earlier periods especially is very strongly marked. "The legislative power of the Court of Parliament," says a writer who has investigated this subject with great learning and ability, "was exercised unconsciously, because it resulted from the remedial power. Complaints arose of violations of the law, of neglect of the law. The monarch promised to forbid the abuse; and further remedies were provided in defence of the existing law. It was strengthened and declared. Its principles of justice and equity received a new and more solemn sanction. Remedial and declaratory statutes thus succeeded to older remedial and declaratory statutes. Yet Parliament, echoing the sentiments, if not the words, of the Barons of Merton, scarcely ever intended to introduce a new law, to enact a new statute." *

There can be little doubt that the Saxon Witenagemot was the root from which has sprung our modern English Parliament, and nearly as little that the Witenagemot was in its original conception and institution rather a court of law than a legislative body. The Parliament indeed still retains this its original character in part, and is accordingly styled the High Court of Parliament, although it is no longer a tribunal for the trial of ordinary causes, now that other courts have been established exclusively for that purpose. The Witenagemot seems to have been for the whole kingdom what the Shire-moot, afterwards called the Sheriff's Leet or Tourn, was for each shire, and what the leets of the hundred and the town (or manor) were for these subordinate divisions. It is to be observed that these were all to a certain extent representative assemblies. "Originally," says the writer we have just quoted, "the leet of the hundred (which he considers to have been the organic germ, or the unit as we might call it, of the Saxon commonwealth) was held twelve times in each year. Magna Charta enacted that it should only be summoned twice within that period. The indwellers of the hundred, who owed suit real to the leet, appeared in the moot by their judicial representatives. These were the tithing-men, the headboroughs, the chief pledges, who were respectively accompanied by four good law-worthy men, belonging to the Friborgs which deputed them. The Saxon Custumal of Henry I. also notices the presence of the parish priest; and it seems to intimate that the lord or his steward might supply the place of the reeve. As all crimes were committed against the peace of the people, the offender who was untrue to his Friborg was impeached or accused by his pledges or the delegates of the little community which answered for his default. To use the technical term of the law, the offence was *presented* to the leet jury, or legislative and judicial branch of the assembly." * From this account a general notion may be formed of the original constitution and probable mode of procedure of the other moots or assemblies; the Witenagemot, or supreme national assembly, amongst the number.

The most learned investigation of the constitution of the Witenagemot is that which it has received from Sir Francis Palgrave. "In the smaller kingdoms," he observes, "such as Kent, the Witenagemot did not probably differ materially in composition from the Shiremoot, which assembled on Penenden Heath in subsequent times. The prelates appear as the first order in the community. The seniors, earls or aldermen, are convened, not only in the character of chieftains, but also by virtue of the bond of 'trust' which connected them with their sovereign. The thanes gave suit and service, as principal landlords. And the ceorls, attending for the townships, listen to the promulgation of the decree, declare their grievances, and *present* the trespasses committed in the communities to which they belong. The actual appearance of the foregoing classes is not a

The Witenagemot—The King Presiding. From the Cotton MS. Claudius, B. iv.

matter of hypothesis, but of evidence; the document lies before us in which they address their sovereign; and, with respect to the functions exercised by the ceorls, the testimony of the Anglo-Saxon laws receives the fullest corroboration from the universal usage of subsequent times."* "In the earlier periods," he proceeds, "a dependent or vassal kingdom retained its own legislature, sitting and acting distinct from the legislature of the paramount kingdom. But the Witenagemot convened by the Basileus was the General Diet or Placitum of the empire. Here the King of Albion appeared, wearing his crown, and surrounded by his great officers of state. The prelates concurred in the enactments. The vassal kings, the rulers of the Cymric and Celtic tribes, testified their obedience. The earls, and ealdormen, and thanes, whether of Anglo-Saxon race, or the Northmen settled in the Danelagh, completed the assembly, which comprehended all the councillors and sages, redesmen and witan, both clerks and laymen, whose advice and assistance the sovereign was entitled to demand."† The great point of doubt and dispute has been the character in which the folk or people appeared, who are repeatedly mentioned both by the old historians and in the laws themselves, as present at the Witenagemot. There has been much controversy both as to who the persons were that are thus designated, and as to whether they formed a constituent part of the assembly, or were only spectators of the proceedings. Taking all the circumstances into consideration, Sir Francis Palgrave thinks that "we may be led to the supposition that the elected or virtual representatives of townships or hundreds constituted the multitude, noticed as the *people*, in the narratives describing the great councils and other similar assemblies; for the share taken by the *folk* in the proceedings forbids the conjecture that the bystanders were a mere disorderly crowd, brought together only as spectators, and destitute of any constitutional character."* "Admitting," he adds, however, "the great probability that the burghs did constitute a branch of the Witenagemot, or Mycel-getheacht, it must be recollected that the members, by whom they appeared, would scarcely attend in the character of *mere* deputies. Popular election, in our modern sense of the term, rarely (if ever) existed. The functionaries who ruled the burgh became the proper and natural representatives of the community in the legislative assembly or in the congress; and if the imperial Witenagemot was intended in any wise to protect the privileges of the nation, the heads of the burgh would be the most efficient advocates and defenders of their community."† As it was hardly possible, however, that all the magistrates could, generally, or on any occasion, give their attendance, thus leaving the burgh without any government, he thinks it probable that some one of them would usually be deputed by the rest to undertake the duty. It might even in particular contingencies be inconvenient for any of the magistrates to leave their station. "In such a case," proceeds Sir Francis, "the expedient of authorising a person, not bearing office, to appear as a deputy, in the name and on the behalf of the magistracy, would be easily suggested, and a representation approximating to the modern system would be formed."‡ Still, it must be remembered, there was here an election by the magistracy only, and not by the people. The people, there-

* English Commonwealth, p. 635. † Ibid. p. 645.
‡ Ibid. p. 646.

fore, were not directly represented in the Saxon Witenagemot. The only representation of the burghs or of the Commons was a representation merely of the thanes or governors of the burghs and townships, who in some cities, indeed, were themselves elected by the people; but in other cases appear to have been hereditary, or to have held their offices by a sort of proprietorship. To this indirect representation of the Commons, nevertheless, through persons having at least a natural connexion with them and an interest in their welfare, may most probably be traced back all that yet exists among us of popular parliamentary representation. Indeed, up to the passing of the Reform Bill, many burghs were only represented as they had been in the Saxon times; and even now the Commons enjoying the right of election are everywhere only a class, however important a class, of the people.

The supreme government of the state resided in the witenagemot and the king, who presided over the assembly while it sat, and who appears to have had the right of calling it together, and also probably of dissolving it at his pleasure. It seems to have been wont to meet several times in the course of the year, usually at the great festivals of Christmas, Easter, and Whitsuntide; and its sessions were no doubt very short. It is impossible, from the imperfect accounts that remain, to discover what were understood to be the limits of the royal authority and of that of the parliament; but in all the more important acts of the executive, the concurrence of the legislative body seems to have been required. Alfred and his successors promulgate their laws as enacted by themselves with the advice of their witan. The king, as the first magistrate and head of the state, was held in high honour and invested with many prerogatives, such as the right of commanding the forces, of appointing and displacing all the chief administrative functionaries throughout the kingdom, of dispensing justice in the last resort, and of pardoning offenders or mitigating and remitting penalties. His independent power of action, as one of the estates of the realm, however, seems to have been confined by the theory of the constitution within rather narrow limits. But in such a state of society the real power of the sovereign would depend much more upon his personal character and the accidents of his reign, than upon any understood principles of the constitution. On the whole, the royal authority had, from the first foundation of the Anglo-Saxon kingdoms, been gaining ground upon that of the witenagemot, in which had originally resided the supreme and sole government of the nation, the king being merely its elected president or deputy. The large and constantly increasing territorial possessions of the crown no doubt greatly contributed to secure for it a position of elevation and power far beyond that which it had originally occupied. After the union, especially, of the several states of the old Heptarchy into one kingdom, the lands in all parts of England which were held by the king must have formed a property of immense extent. These lands, as we have already intimated, appear to have been originally in part the private domains of the kings, in part the public lands reserved on the first settlement of the nation for the support of the government; but the two descriptions of property had in course of time naturally become mixed up together, and the crown retained the uncontrolled management of the whole. In return, the crown, from the revenues of these estates, from the annual payments by the burghs in lieu of services, and from certain other profits to which it was by law entitled, defrayed all the ordinary expenses of the supreme civil government. The additional revenue chiefly arose from customs at the sea-ports, tolls in the markets, and other taxes paid on sales, and from the wites or public penalties exacted from persons convicted of delinquencies, over and above the were-geld or damages paid by them in satisfaction of the private injury. There is reason to believe, also, that in later times at least much of the land throughout the kingdom became subject to certain occasional payments to the crown, similar to those which were afterwards made universal under the more systematized feudalism of the Norman government; but their exact nature cannot now be ascertained. The only burdens to which it is quite certain that all landed estates were subject are those called by later writers the Trinoda Necessitas,—among the Saxons themselves the three common labours, or universal necessities—of the Brycg-bote, the tax for the maintenance of bridges and highways; the Burh-bote, that for the repairs of walls and fortresses; and the Fyrd, or military service. It is conjectured, from the notices in Domesday Book, that in most parts of the kingdom one soldier was required to be provided in time of war for every five hides of land,—a hide being, according to Bede, as much land as could maintain a single family throughout the year. It appears that all England was divided into about 274,950 hides of land.* The Danegeld, also, or tribute to the Danes, first collected in 991, in the reign of Ethelred, was a tax upon each hide of land; and although for some time it was only imposed on particular occasions, it eventually became permanent, and formed an important portion of the ordinary revenue of the crown. At the original rate of a shilling for each hide of land, it produced 12,180*l.*, equal in weight of silver to nearly three times the same amount in modern money, and in efficiency to a much greater sum. It is said, however, to have been raised by Canute, in 1018, to six shillings on the hide; and four shillings was in later times the common rate.

Much controversy has taken place on the question of whether the feudal system of the tenure of lands is to be considered as having been introduced into England in the Saxon times. That the system, in all its regularity and extent, was not fully established till after the Conquest, is generally admitted; but it appears to be equally clear, not

* Brady's History of England, i. 270.

only that, in the reign of the Confessor, a very considerable advance was made towards its perfect consolidation after the continental model, but also that in a ruder shape and looser coherency it had subsisted among the Anglo-Saxons from their first settlement in the country. We have given an account of the division of the proprietors of the soil into hlafords and men, which terms are merely the lords, or superiors, and vassals of the feudal phraseology. And in the earliest Saxon times the vassal seems to have held his land (which might have been, though it was not, called his fief) from his lord, on condition of rendering services precisely similar to those which, in after times, were rendered by a vassal to his feudal superior. Upon this subject it has been well observed by a writer whose prejudices are by no means always a match for his learning and acuteness, that there are two divisions of the history of the feudal system, the former of which "extends, from the earliest account of time, through the early history of Greece and Rome, till the progress of society changed the manners of these nations; and through the early history of the Goths and Germans, who overturned that Roman empire, down to the eleventh century. At this period commences the corrupted feudal system, and lasts till the fifteenth century, when the feudal system began, after its corruption, to dissolve quite away. The feudal system was that of the Persians, who were, and are, Scythæ or Goths, as ancient authors and their own speech testify. Xenophon tells us that when the younger Cyrus came to Cilicia, he was met by Epyaxa, the beautiful wife of the Satrap, who, according to the custom of the East, presented her acknowledged liege lord and superior with gold, silver, and other precious gifts. Indeed, the feudal system, about which so much noise is made, is the natural fruit of conquest, and is as old in the world as conquest. A territory is acquired, and the state or the general bestows it on the leaders and soldiers, on condition of military service, and of tokens acknowledging gratitude to the donors. It was known in the Greek heroic ages. It was known to Lycurgus; for all the lands of Sparta were held on military tenure. It was known to Romulus, when he regulated Rome. It was known to Augustus, when he gave lands to his veterans, on condition that their sons should, at fifteen years of age, do military service. The reason it did not preponderate and corrupt in Greece and Rome was, that it was stifled by the necessary effects of cities. In Persia, where there were no cities of any power or privilege, it preponderated and corrupted at an early period."*

We now proceed to consider the general character of the laws of the Anglo-Saxons, and to describe their modes of judicial procedure.

It is remarked by M. Guizot that there is one material point of difference between the Salic laws and the capitularies of the Carlovingian Frank kings. The former do not contain moral and religious texts in the way of advice; they only contain texts formally prohibitive or imperative. "But in the passage," we quote the words of M. Guizot, "from primitive barbarism to civilization, legislation assumes another character; morals introduce themselves into it, and become, for a certain time, matter of law.* The able legislators, the founders or reformers of communities, became aware of the empire exercised over men by the idea of duty; the instinct of genius informs them that, without its support, without the free concurrence of the human will, the society cannot maintain and develop itself in peace; and they apply themselves to introduce this idea into the minds of men by all sorts of ways, and they make of legislation a sort of preaching, a means of instruction. Consult the history of all nations, of the Hebrews, the Greeks, &c.; you will everywhere encounter this fact: you will everywhere find, between the epoch of primitive laws, which are purely penal, prohibitive, intended to repress the abuses of violence, and the epoch of civilised laws, which have confidence in the morality, in the reason of individuals, and leave all that is purely moral in the domain of liberty; between these two epochs, I say, you will always find one in which morals are the object of legislation, in which legislation formally writes and teaches them. Franco-Gaulish society was at this point when Charlemagne governed it, and that was one of the causes of his strict alliance with the church, the only power then capable of teaching and preaching morality." †

Something similar to what M. Guizot has here described is observable in the Anglo-Saxon laws; the laws of the earlier kings partaking more of the character of the Salic law above specified, those of the later partaking more of that of the capitularies of Charlemagne.

Of the eighty-nine laws, of which the collection bearing the name of King Ethelbert, of Kent, the earliest Saxon laws that are extant, consists, a majority (upwards of fifty) have reference to the punishment of acts of violence against the person. The next most numerous class is occupied with penalties for illicit intercourse with, and acts of aggression towards, women. The next has reference to theft. There are not more than three or four—at the most five—laws in the collection that are not of a penal character, but descriptive merely of certain rights. There is not a single paragraph of the nature merely of a moral or religious test. We may thus tabularise the result:—

Attacks on Person	58
Attacks on Property	11
Fornication and Aggressions on Women	13
Adultery	2
Total of Penal	84
Declaratory of Rights	5
Total Number of Laws	89

Ethelbert's reign was about the end of the sixth

* Pinkerton's Dissertation on the Scythians, p. 140. (Edit. of 1814.)

* The meaning must be, affirmations of moral truths, or supposed truths, come to be promulgated and received as laws.

† Histoire de la Civilisation en France, tome ii. p. 329.

and the beginning of the seventh century. In his legislation, adultery was thus disposed of:—"If a free man lie with a free man's wife, let him expiate his offence and buy another wife, and take her to the other man." About a century after, in the laws of Wihtræd, a change of tone is observable; the legislator uses the style of exhortation rather than of prohibition or command:—"Let adulterers be brought to repent and lead a virtuous life, or be excommunicated from the assembly of the church." It is not improbable, however, that the civil penalty was continued along with the test and the religious penalty; for afterwards, in the laws of Canute, we find, together with the moral and religious test, the penalty much increased in severity. It is remarkable that, in the last-mentioned collection, in one of the articles there is more attempt than usual at precise definition:—"Adultery is bad which a married man commits with an unmarried woman, and much worse with another man's wife, or with a woman who has taken upon her the monastic vows."

In this collection of the laws of Ethelbert there are thirty-nine laws specifying different wounds, and inflicting various penalties accordingly. In all this we see legislation in a very rude state. But there are other points of view in which these early laws are objects of extreme interest. One of these is the nature of the penalties they decree. Here there appears a singular regard for the person and the liberty of the subject. There is little or no corporal punishment, no imprisonment, no death punishment, at least which may not be compounded for; for as we have seen in the last section, even the life of the king had its price. The chief, or rather only, punishment in the Anglo-Saxon as in the Salic law, is the composition, the "wehrgeld," that is, a certain sum which the delinquent was bound to pay to the injured party or to his family. To this was added, in many cases,—those which may be called, in the language of the English law, "pleas of the crown,"—a sum paid to the king or the magistrate as a compensation for the violation of the public peace. The not unusual alternative, as we have already had occasion to remark, where the offending party was unable to make good the "wehrgeld," was to reduce him to the state of slavery.

"The composition," observes M. Guizot, "is the first step of criminal legislation out of the custom of personal vengeance. The right concealed under that punishment, the right which exists at the bottom of the Salic law, and of all barbarous laws, is the right of every man to do himself justice, and to avenge himself by force: it is the war between the offender and the offended. The composition is an attempt to substitute a legal system for war; it is the means given to the offender of securing himself, by the payment of a certain sum, from the vengeance of the party offended; it imposes upon the injured party the obligation to renounce the use of violence.

"We must not imagine, however, that from the first it had that effect; the offended party for a long time preserved the right of choosing between the composition and war,—of rejecting the "wehrgeld" and having recourse to vengeance. The chronicles and documents of every kind leave scarcely a doubt of it. I incline to think that in the eighth century the composition was decidedly obligatory, and that the refusal to be satisfied with it was regarded as a violence, not as a right; but assuredly it was not always thus, and the composition was an attempt, sufficiently inefficacious, to put an end to the disorderly struggle of individual forces, a sort of legal offer from the offender to the offended."*

From the apparently deep feeling of morality and liberty, in the solemn renunciation of vengeance on the part of the injured party, and as regards the offender in the respect displayed for his person and liberty, exhibited to so much greater a degree in these early laws, particularly in the composition, than in more civilised systems of legislation, some late German writers have conceived an erroneously high notion of the state of civilisation of the nations among which it is found. M. Guizot has very ably exposed the fallacy of these writers. Admitting that at that epoch individual liberty is really great, we must be on our guard against confounding such liberty with what in the present day is understood by that term. It is a liberty possessed by a man of doing what seemeth good in his own eyes, it being at the same time always carefully borne in mind that every other man has exactly the same liberty of doing what seemeth good in *his* eyes; so that whenever that which seemeth good to one man doth not comport with that which seemeth good to another, a clash takes place, and in such a state such clashes are almost as frequent as those in the elemental war of primæval chaos. Such a state of society has been most justly and forcibly described by Hobbes in the following passage:—"Whatsoever is consequent to a time of war, where every man is enemy to every man, the same is consequent to the time wherein men live without other security than what their own strength and their own invention shall furnish them withall. In such condition there is no place for industry, because the fruit thereof is uncertain; and consequently no culture of the earth; no navigation; no use of the commodities that may be imported by sea; no commodious building; no instruments of moving and removing such things as require much force; no knowledge of the face of the earth; no account of time; no arts; no letters; no society; and, which is worst of all, continual fear, and danger of violent death; and the life of man, solitary, poor, nasty, brutish, and short."†

For this state of chaos, which cannot be called society, two remedies arise:—1. Inequality of condition shows itself among men; some become rich, others poor; some become noble, others obscure; some masters, others slaves: 2. A central public power develops itself, a force which in the name of

* Histoire de la Civilisation en France, tome i, p. 343.

† Leviathan, c. xiii.

the community proclaims and enforces certain laws. Thus arise on one side aristocracy, on the other, government,—two different modes of repressing the excess of individual liberty.

But, in their turn, the remedies become evils: the aristocracy and the government both oppress, producing a disorder, different from the former, but deep and intolerable. In the mean time, however, by their influence, and by the natural action of social life, individuals are improved and enlightened; their understanding becomes stronger, and their will better regulated. They begin to see that they can live very well in peace without so much inequality of conditions, and so much central power,—in other words, that society can exist without costing liberty so much. Thus "if liberty," to borrow the language of M. Guizot, "perished at the commencement of the social career, it was because man was incapable of advancing while he retained it; to regain it and enjoy it more and more is the end, the perfection of society; but this is by no means the primitive state, the condition of barbarians.... Instead, then, of ascribing to the plan of *composition* so much moral value, we must only regard it as a first step out of the state of war." *

Let us now turn from these early Anglo-Saxon laws to those of a later period; and, as the best means of affording to the reader a general idea of the character of these, we shall give an analytical table of those of the kings of the Heptarchy after the accession of Alfred, which have been collected by Wilkins.†

	Declaratory Legislation.	Penal Legislation.	Legislation of Procedure.	Religious Legislation.	Canonical Legislation.	Moral Legislation.	Totals.
Alfred	6	32	3	12		13	66
Edward the Elder .	2	8	1				11
Athelstane	4	18	1	2			25
Edmund	8	9					17
Edgar	6	5		97	55		163
Ethelred	1	2	2				5
Canute	15	34	10	32	7	6	104
	42	108	17	143	62	19	391

We will now add a few remarks as to the relative proportions of the classes in the preceding table to one another in different reigns, as well as in explanation of the classes themselves into which we have arranged these Anglo-Saxon laws.

I. *Declaratory Legislation.* In this column of the table we have placed, as well as we have been able to interpret their meaning, those *capitula* or laws which have appeared to us merely expository of rights and duties. It will be observed that the figures do not present much apparent increase in the number of this class, at least till the time of Canute.

II. *Penal Legislation.* Under this head we have classed those commands or prohibitions having a definite sanction or penalty annexed to them. We have also, however, included certain laws of Alfred's, respecting which it may be doubted whether they do not rather belong to the religious or the moral column; for at the beginning of the collection of Alfred's laws stand about fifty *capitula* or articles, all taken from the laws of Moses, with the exception of one or two from the canons of the first apostolic council. Now, though many of these Mosaic laws appear merely in the shape of religious or moral precepts, others have distinct penalties attached to them; and, therefore, as we see no evidence that Alfred did not mean these penalties to be enforced, we have placed them in the class of penal legislation, while those without such penalties we have placed in the religious and moral classes.

III. *Legislation of Procedure.* Under this head we have classed those *capitula* that appear to refer exclusively to the machinery for executing the rest. Although of great importance in a rude state of society, this branch does not appear from the table to have borne, at least till the time of Canute, any considerable proportion to the others; the reason probably being, that originally the execution of the laws being vested in the same hands that had the making of them, it would be some time before those who were thus at once magistrates and legislators would become aware of the necessity of guiding their proceedings in their former capacity by certain fixed rules. We are told of Alfred's zeal for the proper administration of the laws; but we do not find many enactments, among those laws of his that have come down to us, relating to that subject. We may assume, therefore, that the praise to which he was entitled was not so much that of having improved the old modes of procedure as that of having exerted himself successfully in seeing the laws strictly and impartially executed.

IV. *Religious Legislation.* Under this head we place the enactments regarding the people at large in their relation with the church or the clergy. In reigns where the clergy possessed great power arising from influence over the king, it will be seen that this branch of legislation was a very large one, sometimes the largest of any.

V. *Canonical Legislation.* The same remark applies to this head, under which we class the enactments regarding the duties and functions of

* Histoire de la Civilisation en France, *tome i. p.* 349.

† The oldest of the Anglo-Saxon laws now extant are those of King Ethelbert, of Kent, who reigned from 561 to 616. The next are those of Hlothaire and Eadric, and of Wihtraed, kings of Kent. Next are those of Ina, king of the West Saxons. After the Heptarchy we have the laws of Alfred, Edward the Elder, Athelstane, Edmund, Edgar, Ethelred, and Canute. There are, besides, canons and constitutions, decrees of councils, and other acts of a public nature. All these are in the Saxon language; of some of them a collection was made in one volume folio, by Mr. Lambarde, and published, in 1568, under the title of "Αρχαιονομια; sive, de priscis Anglorum legibus." An enlarged edition of Lambarde's book was published under the superintendence of Abraham Wheloc in 1644. To this many additions have since been made by Dr. Wilkins, in his Leges Anglo-Saxonicæ, fol. Lon. 1722. The laws in Latin, which have gone under the name of Edward the Confessor, have been rejected by antiquarians as spurious. They are supposed to have been written or collected about the end of the reign of William Rufus.—Reeves's Hist. of the English Law, i. 97; Wilkins's Leges Angl. Sax. *passim*.

the clergy alone, as distinguished from the rest of the community. From the influence which churchmen, from their superior education, possessed for many centuries in the European governments of the middle ages, we might expect this and the preceding columns of the table to be large ones. Accordingly such they are, forming together more than half the total number of laws.

VI. *Moral Legislation.* Under this head are classed those articles which, having no sanction annexed to them, are to be viewed merely as moral precepts, and not as laws at all. The column appropriated to these in the table will be seen not to be a large one, and more than two-thirds of its articles belong to Alfred. We may add, that several of these articles being of the number of those taken by Alfred from the Old Testament, may be, under another point of view, considered as belonging to the religious column.

It appears to have been not till a late period that judges were appointed among the Anglo-Saxons expressly for presiding over the trial of causes. According to Ingulphus, it was Alfred who introduced this innovation. He is stated to have divided the office of the governor of the province or shire into the two offices of viscount (or sheriff) and justiciary. But the system of the Saxon jurisprudence was such as usually, whether the case would be called, in modern phraseology, a civil or a criminal case, to leave very little to be done by the presiding functionary, except perhaps to pronounce the sentence. Everything was regulated by certain rigid forms, which of themselves determined the issue, without the discretion or judgment of the persons before whom the trial was held being at all called into exercise. The trial took place in one or other of the public assemblies, the folc-mot, the leet of the hundred, the shire-mot, or the witenagemot, according probably to the residence and rank of the parties, and the importance of the question, or, perhaps, according as it was a first trial or an appeal. The chief ordinary business of all these courts seems to have consisted in the hearing of causes, which it was obviously necessary should at least be carried on and concluded before some public or recognised tribunal. But the trial itself was rather of the nature of an arithmetical calculation, or a chemical experiment, than what we now understand by the trial of a cause. A certain form was gone through, and according to its result, which was always palpable and decisive in the one way or in the other, the accused person was found guilty or acquitted,—the verdict, to use the modern language, was for the plaintiff or the defendant. This view of the subject, as far as we are aware, has not before been stated; but its correctness will be apparent from a short account of the mode of procedure in Saxon trials at law.

In the first place, in all cases, whether in disputes about property or in the pursuit of alleged offenders, the claimant or the person who conceived himself to be injured appears to have retained, under the Saxon law, so much of the rights of a state of nature as to be entitled to begin the process at his own hands, and by an act of force;—he made forcible entry upon the land, or he seized without any writ the person of the accused. It was only after this that the law interfered, or rather that application was made to its authority. The cause might be brought into court in various ways. A person accused of an offence, for example, might be arraigned either by the presentment of the thanes (or heads) of the hundred, or by that of the ceorls inhabiting the township, or upon the appeal of the injured party, swearing that he was not actuated by hatred or animosity, and having his oath confirmed by that of seven compurgators.* The following is the account of the sequel of the proceeding given by Sir Francis Palgrave:—"The culprit being thus charged with the crime, either by the voice of the country or by the testimony of the appellant, he was put upon his deliverance; but, at this stage of the trial, if he belonged to the Sithcund class, or to the Villainage, he was required to obtain the testimony of his superior. The hlaford, or his gerefa on his behalf, came forth and swore that the man had not been convicted of theft within the period of limitation, which appears to have been usually fixed from the last great council, and had never paid the theft-fine. This declaration was confirmed by the oaths of two other true men, or thanes; and the culprit had then the privilege of clearing himself, either by simple compurgation or by the simple ordeal. If he asserted the liberty of appealing to that testimony of character which was termed compurgation, he himself swore to his innocence, and a certain number of his neighbours, whose 'worth,' according to the legal arithmetic of the Anglo-Saxons, was considered as equivalent to one pound, were assigned as his compurgators. If they confirmed his oath by their own, he was acquitted of the charge; but if he was unable to procure this testimony, and dared to abide the 'judgment of God,' he plunged his arm into the boiling cauldron up to the wrist, or he bore the red-hot iron in his naked hand for the distance of nine paces; and if, after the lapse of three days, no marks of injury appeared, he was declared innocent of the crime. Such was the proceeding when the testimony of the lord or superior was in favour of the accused. But if he refused to afford the testimony which diminished the suspicions of the law, then the culprit was bound to undergo the threefold ordeal; he plunged his arm into the boiling water up to his elbow, the iron was of treble weight, and his compurgation, if he preferred that mode of trial, consisted of five compurgators, he being the sixth hand."† A civil suit was decided by a mode of procedure precisely similar in principle, though differing in some of the forms. In either case, everything depended upon the number and the legal "worth" or estimated value of the witnesses which each party was enabled

* Palgrave's English Commonwealth, p. 213. † Ibid. p. 215.

to bring forward, or upon the issue of some experimental process resembling the ordeals that have just been mentioned. Sometimes the question was decided by what has been called the ordeal of the cross, that is, by the accused party being allowed to draw from under a cover either of two pieces of wood, on one of which the figure of the cross had been cut: if he drew that, he was acquitted; if the other, he was condemned. Another ordeal was that called the corsned; this was a small piece of bread (supposed to have been, originally, though it was not latterly, the sacramental wafer), which was given to the culprit to eat, and, if it appeared to stick in his throat, or if he shook or turned pale in the attempt to swallow it, his guilt was held to be proved. It appears most probable also that the wager of battle, although commonly supposed to have been of Norman introduction, was in use among the Saxons before the Conquest.* This was merely another species of ordeal, or appeal to Heaven. By this mode of trial, after the requisite averments had been made on oath by the two parties and their witnesses, each party denying word for word what the other had asserted, the two would be brought together and set to fight out their quarrel with arms in the presence of the court, which here again, as in all other cases, had nothing more to do except to see that the prescribed regulations were observed, and to watch the result. The result of itself declared the verdict.

In everything, therefore, we see the trial was reduced to the performance of an operation every step of which was regulated by certain established rules, and about the result of which, that result deciding the case, there could be no mistake or dispute. This view of the subject at once explains another peculiarity which has been noticed as marking the legal procedure of the Anglo-Saxons. In their trials circumstantial evidence was wholly disregarded. Witnesses were only allowed to swear that the fact in dispute was or was not as represented by either of the contending parties.† It is plain that it was only such direct evidence as this that admitted of being counted and summed up according to the simple rule of tale which we have supposed to govern the whole proceeding. The weighing of circumstantial evidence would have demanded the exercise of discretion and judgment, and consequently the apparatus of a court in the modern sense, that is, either a single judge, or (what would have been more conformable to the spirit of the Gothic polity, and what it eventually produced) a bench or box of judges, consisting, it might be, of one to preside and direct, and a number of others to deliberate,—our present judge and jury. There has been much controversy as to whether the institution of the jury existed among the Saxons, and it is a question upon which legal antiquaries are still divided. But if the view that has been taken of the principle of the whole Saxon legal system be correct, it is evident that what we now understand by a jury could have found no part in that system, so long at least as it retained its original and proper character unimpaired. A jury could have been of no use, and would have had no duties to discharge. The finding of the verdict was not an affair of deliberation; it was an affair of observation merely, and was sufficiently performed by the general body of the persons present at the trial, among whom there never could have been any doubt or dispute on the subject. We shall afterwards have occasion to show how the modern jury in all probability arose out of the ancient mode of conducting trials; but the thing itself, like the name, is undoubtedly not Saxon but Norman, that is to say, it did not come into use until the Norman times. We will here only observe that it was not, properly speaking, the increased complication of the relations of society, and of the matters giving rise to legal trials, that led to the abrogation of that ancient system, and the substitution of the system of the jury. The fact is, that the jury and the ordeal could not practically exist together. The principle of the one mode of trial was altogether opposed to that of the other. If the ordeal could have maintained itself against the adverse forces of another kind with which it necessarily had to contend as society advanced, and which eventually brought about its downfall, the increased complication of the affairs of the community would not have overthrown it, or introduced the substitute of the jury. If it could have retained the support of public opinion, it would have been sufficient for any state of society, however complex, and the jury never would have supplanted it.

The ordeal was the soul of the original Anglo-Saxon system of law; and this has probably been among all nations the first resort in the attempt to substitute any other law for the law of mere force. And although it is really not at all more equitable than the law of force, it still has certain decided advantages in other respects over the rule of mere physical strength. It is the substitution of policy for violence, and that is necessarily in itself a humanizing and productive change. The ordeal, also, it is to be remembered, though in reality, if fairly conducted, only a throwing of the dice, and leaving of the decision to chance,—if collusively managed, capable of being made an instrument of great injustice and cruelty,—was believed, so long as it was in use, to be nothing less than an appeal to Heaven, and to be always effective in securing the fairest and wisest of all possible decisions. It was the decay of this belief, and nothing else, that occasioned the abolition of the ordeal. But even while it was still legally recognised, and in constant application as the final mode of determining a cause, an apprehension was naturally entertained that Heaven might be offended by such an appeal being lightly or too frequently made to it; and there was accordingly a shrinking from the ordeal on the part

* This is the opinion of Sir F. Palgrave. See English Commonwealth, pp. 223-225.

† Palgrave's English Commonwealth, p. 232.

of the law, and an effort to avoid it as far as possible by taking refuge in another method of decision. The next advance to a correct system was the admission of the sort of evidence which we have found to have been received in the first stage of the trial among the Anglo-Saxons, and the treatment of it in the manner that has been described. The resort to the ordeal was in this way avoided altogether in many cases; for if the culprit or defendant failed in his compurgation, or could not bring up a sufficient "worth" of witnesses to balance the testimony against him, he was not allowed his appeal to the "judgment of God." This was a great step gained in the progress towards the decision of the case solely upon the evidence, and the weighing of the evidence in the scales, not of the calculating faculty, but of the judgment.

So that there may be said to be four, or, more accurately, five distinct stages in the ascent up to our present method of judicial practice, which is the last of the five. Of those preceding, the first is that in which all disputes are decided by mere brute force, emancipated from all check or regulation. The second is that in which disputes are decided by such a proceeding as the wager of battle, in which physical force is still left the umpire, but is constrained to act under certain forms; and some contrivances in reference to the weapons and mode of the encounter are also usually introduced, which go in some degree to reduce any natural inequality that may chance to exist between the combatants. The third stage is that of the ordeal, or imaginary appeal to Heaven; by which the law of force is first wholly put down, being supplanted by the law of chance, taking, however, the appearance of a criterion of a very different kind, and being believed to be the actual adjudication of Heaven. And the fourth is that in which evidence first makes its appearance, though as yet only in subordination to the ordeal, which is still maintained in its position of the supreme and finally determining test. It would be very easy to show how each of these modes of procedure is naturally evolved out of the one immediately preceding it, as well as how the last-mentioned leads in like manner to the introduction of its proper successor,—the mode that now prevails.

We are apt to assume that the hearing of evidence is the natural mode of trying a cause, and the earliest that would be adopted. But the science of evidence, both in law and in all other departments of inquiry where we have to do with mere probabilities, is late in springing up, and long in being brought to perfection. The science of mathematical demonstration, where there is little complexity and no uncertainty, may be early cultivated and perfected; but not so that of the evidence either of human testimony or of any description of what we may call merely indicative facts. The ancient Greeks and Romans, with all their cultivation, seem to have had no distinct notions on the subject of evidence in any department either of physical or of moral inquiry. They philosophized, indeed, eloquently and ingeniously both in morals and in physics, but just as frequently without as with any regard to the facts bearing upon the question. In historical inquiries it is only in modern, and it may be said in very recent times, that the science of evidence has been at all applied; the ancients do not seem to have dreamed of such a thing; and among ourselves, down to the seventeenth century, it was equally unheard of and unthought of. Camden was perhaps the first English writer in this department who doubted anything that had been asserted by his predecessors; all our older chroniclers took in each the whole of what had been told by those who had gone before him as unresistingly as one sheet of paper after another, in the process of printing, takes the impression of the types on which it is spread. Look at the boundless credulity of the numerous copiers of the fables of Geoffrey of Monmouth and Bishop Bale, or of those of Fordun and Boyce among the Scottish writers down even to Buchanan and Sir George Mackenzie, the latter of whom flourished at the time of the Revolution. And what was the inductive philosophy of Lord Bacon but a development of the science of evidence as applicable to physics? Yet it was wholly new to the world little more than two centuries ago. The science of evidence is a study as foreign to the whole mental dispositions and habits of men in an early state of society as it is to those of children. Both equally demand certainty in all their conclusions, and cannot endure either to act or to believe merely upon a favourable balance upon probabilities. All their methods of investigation, therefore, aim at attaining this certainty. A method which promises less is despised and rejected. Hence anything else is preferred to the patient and impartial examination of facts;—anything that will produce an instant and complete conviction,—a supposed sign from Heaven of any kind,—some circumstance impressive enough to occupy the imagination and exclude every other view of the subject,—or even, when nothing better is to be had, mere authority and confident assertion. This is the time of inexperience and of ready and abundant faith. The science of evidence is the offspring of doubt, as well as the parent of rational belief and of truth.

To prevent objection or misapprehension, it may be proper just to remark further, that very possibly, in point of fact, one mode of procedure may have sometimes been partially introduced before another was quite abandoned; and it is probable, indeed, that the changes were mostly brought about in this way. But what is intended to be affirmed is, that no two of the forms which we have distinguished could ever be mixed up together in the trial of the same cause; for instance, the jury, as we have said, could never be thus employed in association with the ordeal. It was, as is well known, not till within the last twenty years that the old mode of trial by judicial combat, or wager

of battle, was abolished;* and Sir Francis Palgrave seems to think that the right to the trial by wager of law derived from the Anglo-Saxon compurgation, still subsists. "At later periods," he observes, speaking of the times after the Conquest, "there were many irregularities arising from the breaking down of the Saxon jurisprudence; parts and portions of the ancient forms continued in use, though no longer guided by their ancient and consistent principles. . . . In all personal actions, wager of law was the regular mode of trial, until new proceedings were instituted, which enabled the judges to introduce the jury trial in its stead. But this silent legislation has not destroyed the Anglo-Saxon trial; it is out of use, but not out of force; and it may perhaps continue as a part of the theory of the law until some adventurous individual shall again astonish the court by obtaining his privilege; and, by thus informing the legislature of its existence, ensure its abolition." †

Absurd as the ordeal was, it had, in its suitableness to the particular social condition of the Anglo-Saxons, certain recommendations not only over the still ruder system which it supplanted, but even as compared with the more refined and intelligent method to which, in due time, it was in its turn to give way. That improved method would have made demands which the age and the country were altogether inadequate to meet. Neither juries nor judges could then have been found to administer justice throughout England according to that plan. Even in our own day the experience of some of the most enlightened countries in the world has proved how difficult a thing it is to get the system of trial by jury to work well among a people to whom it is new. Among the Anglo-Saxons of the ninth or tenth century there certainly was not a sufficiently general diffusion of intelligence either to supply competent judges and juries, or to make their decisions be respected if they could have been found. In the state of society that then existed, it would not have answered for the law to profess to give its decisions on anything like doubtful presumptions. The simple understandings of the men of that time were to be satisfied with nothing less than absolute certainty in such matters. It would have been strange if they had been satisfied with less, so long as they believed that there was such a ready and effective mode as the ordeal of securing that certainty. While they retained their faith in the ordeal, the establishment of any fair plan of deciding causes by evidence submitted to the unshackled judgment of a jury was impossible. But the ordeal, so long as the popular faith in it subsisted, answered the purpose of putting an end to differences, and keeping men under subjection to the law, at least as well as a more equitable and more rational mode of judicial decision could have done. There is reason to believe, also, that on the whole its inherent injustice was rather mitigated than otherwise by the art and management with which the process was no doubt usually conducted.

The principle that has been pointed out as that of the legal procedure of the Anglo-Saxons, it may be observed in conclusion, ran through the whole course of the law and its administration. From the first step that could be taken for the trial of a case down to its final disposal, everything was regulated upon this principle, and arranged with a view to its application; no room was left for any exercise of discretion on the part of the court; the human judgment was never appealed to or its exercise permitted; nothing was trusted to the fallibility of that arbiter; the element of mere probability was excluded as rigorously as it is from the demonstrations of the mathematics. That this system might be carried fully out, not only was a certain value put by the law upon every individual, which determined the amount at which his testimony was to be rated when he appeared as a witness, and the damages he could claim as a plaintiff, and those he could be called upon to pay as a defendant; every distinct limb and part of the body had also its were, or legal worth. Thus, in the oldest laws, a leg was valued at fifty shillings, the little finger at eleven, the great toe at ten, a front tooth at six, an eye tooth at four, a back tooth at one, and a nail of the finger at the same price. In this way every personal injury that could be received had its fixed compensation. After the trial had been gone through, therefore, the sentence or the assessment of damages was as much a matter of course as all the rest of the procedure had been: here, also, the law might be said to go upon its own feet, and to do all but execute itself.

Besides the fines, however, either to the injured individual or to the state, with which most delinquencies were punished, capital punishments were also in use among the Anglo-Saxons in certain cases. Among the "boteles" crimes, as they were called, or those for which the life of the convict was always taken, were treason, military desertion, open theft, house-breaking, and premeditated murder.* Summary punishment might also be inflicted by any private hand upon criminals taken in open delict. "When a capital offence," says Sir Francis Palgrave, "was flagrant, committed in open day, and under such circumstances as to render the act capable of instant and indisputable proof, no further trial was required; no evidence was discussed, and no defence was allowed. Mercy was never extended to the outlaw; he was said to bear a wolf's head, and, like the wild beast to whom he was compared, he was slain whenever he approached the haunts of human-kind;—every

* "The general law of the land," said Lord Ellenborough, in the case of Ashford against Thornton, argued before the Court of King's Bench, in April, 1818, which led to the abolition, "is in favour of the wager of battle, and it is our duty to pronounce the law as it is, and not as we may wish it to be. Whatever prejudices, therefore, may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it."—Barnewall and Alderson's Reports, i. 460.

† English Commonwealth, p. 263.

* Palgrave's English Commonwealth, pp. 204, 205.

hand might be raised to strike him,—none to revenge his fall. If a thief was apprehended 'hond-habend' and 'back-barend,' or in actual possession of the spoil, he was hanged or decapitated by his pursuers without respite or delay. Similar proceedings took place with respect to the murderer. If he was found standing near the corpse with the bloody weapon in his grasp, no witnesses could be heard for the purpose of explaining away a token, which, according to the average of human probability, was necessarily the accompaniment of the transgression. . . . . A stranger lurking in the woods, who did not blow his horn or otherwise proclaim that he was in distress and anxiety, was to be judged as a thief, though no other indication of crime could be alleged against him." * It is scarcely necessary to observe that, notwithstanding some of the expressions made use of in this statement, there was really no procedure here upon mere suspicion or probability. For a man to endeavour to conceal himself in the woods, for instance, was, probably for very good reasons, denounced by the law as in itself a crime; and in the case of the man found beside the newly-murdered body with the deadly weapon in his hand, the presumption of his guilt, though really only a probability, was considered to amount to absolute certainty. Rigidly speaking, indeed, the utmost attainable certainty in such matters is only a strong probability. Even the most direct evidence does not afford anything more.

Among the legal punishments inflicted by the Anglo-Saxon laws, besides fines and death, are found imprisonment, outlawry, banishment, slavery transportation, whipping, branding, the pillory, amputation of limb, mutilation of the nose, ears, and lips, plucking out of the eyes, and tearing off the hair. Their common capital punishment seems to have been hanging, and in some instances stoning.

CHAPTER IV.

HISTORY OF THE NATIONAL INDUSTRY.

BRITAIN, as an island, and one of the largest in the world, as well as from its nearness to the continent of Europe, would seem to have been intended by nature for the residence of a navigating and commercial people, and it might be supposed that any people who had obtained the occupation of it would be speedily turned to navigation and commerce by the natural temptations and advantages of their position. The political state of a country, however, and its social circumstances generally, as well as the condition of the rest of the world and the spirit of the time, may all be so unfavourable as long effectually to counteract these advantages of geographical position, and even the genius and the old habits of the people themselves.

Of the successive nations that obtained possession of the south of Britain within the period of authentic history, the Gallic colonists of the time of Cæsar were in too early a stage of civilization to hold any considerable intercourse with the rest of the world; and the Romans who succeeded them, although they necessarily maintained a certain connexion both with the central and other parts of the extended empire to which they belonged, were of a stock that had always shown itself anti-commercial in genius and policy. But the Saxons, although they had not been in circumstances to turn their skill in navigation to commercial purposes, had long before their conquest of our island been accustomed to roam the seas, and were famous for their naval enterprises. We read of predatory warfare carried on by the different Germanic nations in small and light vessels on rivers, and even along the adjacent parts of the sea-coast, so early as before the middle of the first century. In the year 47, as we learn from Tacitus, the Chauci, dwelling along the Batavian coast, ravaged in this manner the neighbouring coast of Gaul, under the conduct of their countryman Gannascus, who had long served in the Roman armies.* It is probable that it was in the imperial service Gannascus acquired his knowledge of naval warfare, or at least the general military education which fitted him to train and command the Chauci in this expedition. In little more than twenty years after this we find the Roman fleet on the Rhine partly manned by Batavians,* and even a Batavian fleet under the command of Paulus Civilis, another individual of that nation who had been educated in the Roman armies, giving battle to the naval forces of the empire.† In the course of the next two hundred years the German nations generally appear to have improved upon the instruction and experience thus gained; and both the Saxons and others became distinguished for their familiarity with the sea and for their naval exploits. About the year 240 the union under the name of Franks, or freemen, of the various tribes of the Lower Rhine and the Weser, laid the foundation for those more extensive predatory incursions upon the neighbouring countries, both by sea and land, by which the barbarians of the north-west first assisted those of the north-east in harassing and enfeebling the Roman empire, and afterwards secured their share in its division. One remarkable incident has generally been noted as having given a great impulse to these expeditions, what Gibbon has called "the successful rashness" of a party of Franks that had been removed by the Emperor Probus from their native settlements to the banks of the Euxine. "A fleet," to give the story as he tells it, "stationed in one of the harbours of the Euxine, fell into the hands of the Franks; and they resolved, through unknown seas, to explore their way from the mouth of the Phasis to that of the Rhine. They easily escaped through the Bosphorus and the Hellespont, and, cruising along the Mediterranean, indulged their appetite for revenge and plunder, by frequent descents on the unsuspecting shores of Asia, Greece, and Africa. The opulent city of Syracuse, in whose port the navies of Athens and Carthage had formerly been sunk, was sacked by a handful of barbarians, who massacred the greatest part of the trembling inhabitants. From the island of Sicily the Franks proceeded to the Columns of Hercules, trusted themselves to the ocean, coasted round Spain and Gaul, and steering their triumphant course through the British Channel, at length finished their surprising voyage by landing in safety on the Batavian or Frisian shores. The example of their success, instructing their countrymen to conceive the advantages and to despise the dangers of the sea, pointed out to their enterprising spirit a new road to wealth and glory."

This event happened about the year 280. Immediately after this time we read of the commencement of ravages on the coasts of Gaul, of Belgium,

* Tac. Annal. xi. 18.

* Tac. Annal. iii. 16. † Ibid. v. 23.

and of Britain, by assailants who are called Germans by Aurelius Victor, and Saxons by Eutropius. They appear to have been a mixture of Franks and Saxons, which latter name ere long began to be also distinguished as that of another military confederacy of the Germanic nations not less powerful than the Franks. In maritime affairs, indeed, the Saxons soon took the lead; and while the Franks pushed their conquests by land, the Saxon name became a terror to all the neighbouring sea-coasts. Yet their marine was still of the rudest description. "If the fact," says Gibbon, "were not established by the most unquestionable evidence, we should appear to abuse the credulity of our readers by the description of the vessels in which the Saxon pirates ventured to sport in the waves of the German Ocean, the British Channel, and the Bay of Biscay. The keel of their large flat-bottomed boats was framed of light timber, but the sides and upper works consisted only of wicker, with a covering of strong hides. . . . But the daring spirit of the pirates braved the perils both of the sea and of the shore: their skill was confirmed by the habits of enterprise; the meanest of their mariners was alike capable of handling an oar, of rearing a sail, or of conducting a vessel; and the Saxons rejoiced in the appearance of a tempest, which concealed their design, and dispersed the fleets of the enemy." The Romans now found it necessary to fit out and maintain a fleet expressly for the protection of the coasts of Britain and Gaul. The command of this armament, which was stationed in the harbour of Boulogne, was given, as has been related in the preceding Book, to Carausius.* His revolt soon after, and his establishment of an empire for himself in Britain, where he endeavoured to maintain his power by alliances with those very nations of the north whom he had been appointed to repress, and by enlisting the barbarians both among his land and sea forces, was another event in the highest degree favourable to the progress of the Saxons in navigation and naval warfare. It was a new lesson to them both in ship-building and in tactics, which must have made their boldness and hardihood much more formidable than ever. The empire of Carausius had lasted for seven years, when it was overthrown by his death in 294.

In the next century we find the Saxons almost the acknowledged masters of the northern seas, and so constantly infesting Britain that the east coast of the island had come to be known by the name of the Saxon coast, and was strongly fortified, and put under the charge of a warden, whose especial duty it was to repel their assaults. Their defeat by Theodosius, in the neighbourhood of the Orkney Islands, in 368, for which he obtained the surname of Saxonicus, was not accomplished till the barbarians had sustained several encounters with the Roman fleet; and although it seems to have deterred them for a long time after from repeating their descents upon Britain, and although, after the example of the Franks, they were now also beginning to employ their strength more than formerly in military operations by land, they certainly did not abandon the field of their elder renown. The keels of Hengist and Horsa were cruising in the British Channel when they received the invitation of Vortigern in 449; and it was their command of the seas that, by enabling them to maintain all along a free communication with the continent, and also to make their descents upon the island at the most advantageous points, chiefly contributed to gain for the Saxons, Angles, and Jutes, the possession of Britain.

These new settlers, therefore, the fathers of the future population of the country, and the founders of its political institutions and its social state, were by long use a thoroughly navigating race, and, having obtained their island stronghold, they would naturally, it might be thought, proceed both to fortify it by securing the dominion of the surrounding seas, and to make it the centre of a great commercial empire. But although all this was to come to pass in process of time, nothing of the kind happened in the first instance; and the Saxons, after their settlement in Britain, completely neglected the sea, now more truly their proper element than ever, for so long a period, that when they did at last apply themselves again to maritime affairs, their ancient skill and renown in that field of enterprise must have been a mere tradition, if it was so much as remembered among them at all, and could have lent no aid in directing or even in exciting their new efforts. It was not till the reign of Alfred, towards the end of the ninth century, that the Saxons of England appear even to have thought of building a ship, at least for war; and it may be doubted if before that time they had even any trading vessels of their own. Ever since their settlement in Britain they seem to have wholly abandoned the sea to their kindred who remained in their native seats in the north of Germany and around the Baltic,—the Northmen or Danes, by whom they were destined to be succeeded in their career of rapine and conquest.

This latter race of sea-rovers had adopted a policy different from that which had been followed both by the Franks and the Saxons. These two nations, or rather great confederacies of various nations, although they had both first made themselves formidable at sea, had, as we have seen, successively abandoned that field of adventure as soon as they had entered upon the course of land conquest, or at least as soon as they had secured the possession the first of Gaul, the second of Britain, and had established their Gothic sovereignties in these fair provinces of the former western empire. But the Danes, who were also a great confederacy,—the several Scandinavian nations of the Danes, the Swedes, and the Norwegians, being all comprehended under that name,—continued to seek plunder and glory on the waters long after they had founded a multitude of kingdoms on shore. These, however, were not kingdoms carved, like the possessions of the Franks and Saxons, out of the rich and

* See ante, p. 53.

cultivated Roman territory, but were all confined to the bleak and barbarous coasts of the Baltic and the neighbouring seas, where the Romans had never been. Down to the close of the eighth century, Denmark, Sweden, and Norway were each parcelled out into numerous independent principalities, the chiefs of all of which were at the same time also either sea-kings themselves, or more usually were the fathers or elder brothers of the bold piratical captains, who rejoiced in that designation; the custom being for the younger sons of the royal house to be sent to seek their fortune on the ocean, while the eldest was kept at home to inherit his ancestral throne. But the class of sae-konungen, or sea-kings, otherwise called vikingr, which is supposed to mean kings of the bays, where they had their head stations, was very numerous, and comprehended many individuals who were not of royal extraction. Piracy was the common resource of the younger sons of all the best families among these Scandinavian nations; and the sea was regarded as a field whereon a bold adventurer might rear for himself a fabric both of wealth and dominion almost as stable as could be founded on the land. In the course of the ninth century in all the three countries central sovereignties had arisen, and absorbed or reduced to dependence the rest of the chieftainships; but this change did not for some time affect the free movements of the vikingr. They continued as heretofore to maintain their independence on their own element. The new state of things in the north only had the effect of giving a new direction to their enterprises. Formerly the natural prey of the sea-kings of the Baltic had been the territories of the petty land-sovereigns along the coasts of that sea; for their common origin formed no general or permanent bond between the two classes, in circumstances so nearly resembling those under which the various descriptions of wild beasts are thrown together in a forest. But now that something of the strength of union and consolidation had been acquired by the northern kingdoms, they had become less easily assailable; and the captains of the piratical armaments began to look out for adventures and plunder farther from home. The coasts of England, of Scotland, of Ireland, and of France, became henceforth the chief scenes of their ravages. Nor had civilization yet advanced so far in any of the Scandinavian countries as to discountenance these expeditions. On the contrary, the Danish, Norwegian, and Swedish kings were no doubt well pleased to see their natural enemies and the most turbulent spirits among their subjects thus finding occupation elsewhere; and as for the popular feeling on the subject, the old national custom of roaming the seas was still universally held to be among the most honourable of employments. Navigation can be cherished and promoted only by commerce or by war; it never has flourished in the absence of the former except under the nourishment and support afforded by the latter. It was the want of both war and commerce that brought about its decay and extinction among the Franks and Saxons, after their conquests of Gaul and Britain; it was preserved among the Danes through the habits and necessities of that predatory life upon which they were thrown for some centuries by the peculiar circumstances in which they were placed. The power of this third northern confederacy grew up during a period when the spirit of foreign conquest and settlement, generated among the barbarous nations by the dismemberment of the Roman empire, was still in full vigour, but when the means of satisfying it had been taken away in consequence of the previous occupation of Gaul, of Britain, of Spain, and of all the other Roman provinces, by those whose fortune it had been to be earlier in the movement. The Danes were in this way left to the piratical maritime warfare in which they soon became so distinguished; it was the natural result of the ambition of foreign conquest checked by the want of any territory lying open for them to invade and overrun. Still this was in its nature only an intermediate and temporary resource. The instinct of aggression, which it could only imperfectly gratify, it yet fostered, and was constantly strengthening and arming with new power for the full attainment of what it sought. The Danes, under this discipline, were becoming every day more warlike and formidable, and more capable of achieving foreign conquests, whenever they should make the attempt. On the other hand, the Franks and Saxons, whom they would have to drive before them, were, in the unassailed security of their rich and ample settlements, gradually losing the use of war and the power of defending the possessions they had gained. This was the state of circumstances when the Danes commenced, in the latter part of the eighth century, their descents upon the coasts of France, England, Scotland, and Ireland. These Northmen were now merely repeating what had been done by their kindred, the Franks and Saxons, three or four centuries before. They also, from mere plundering incursions, with which they had hitherto satisfied themselves, were about to rise in their turn to the grander operations of invasion, conquest, and colonization, now that occasion presented itself, and called them to that career. This was the proper consummation of their system of sea-kingship; the true end and development of their long course of piracy and desultory warfare. That was but the impatient restlessness of the animating passion repelled, baffled, and in some sort imprisoned; this was its free and natural action. The new path of enterprise, accordingly, immediately attracted to itself all the disposable courage, activity, and resources of the North. It was not left to the sea-kings alone; the most potent of those of the land joined the great national movement, which promised to add new realms to those they already possessed, or to enable them to exchange their niggardly ancestral islets and strips of sea-coast for broader domains in a sunnier clime. By means of these expeditions the pressure and uneasiness occasioned by the opposition between the

old piratical system and the new order of things that was now growing up in the Scandinavian kingdoms, were at once relieved; and while occupation and settlements were found for the more active and adventurous who chose to abandon their native country, more room was also made, and more quiet secured, for those that remained behind.

By these bold sea-captains and their crews was a great part of England taken possession of and occupied; and thus, a second time, did the country receive an accession of the kind of population most appropriate to it as an island,—a race of a navigating spirit and habits. The Normans also, we may anticipate so far as just to remark, were, before they won their settlements here and in France, pirates as well as the Danes and the Saxons; in fact they were merely a division of the Danish vikingr and their companies. So that of the several races that were eventually mingled together to form the English people, no one had to be gradually turned towards maritime affairs by the force of the new circumstances in the midst of which it was placed; all brought along with them an old familiarity with the sea, on which they had in fact lived, and conquered, and maintained dominion, before they had ever made good any footing for themselves upon land.

Notwithstanding all this, however, we find each race, as soon as it has established itself in the country, almost wholly abandoning the former theatre of its exploits, and attaching itself to the land as exclusively as if the sea had been left a thousand miles behind. We cannot discover that either the previous navigating habits of the Saxons and Danes who successively settled in Britain, or the natural advantages of their new position, prompted them to any considerable efforts of commercial enterprise, after they had lost the motive which had originally impelled them to the sea. Nay, as we have already observed, the ships in which, and through which, they had made their conquests, were abandoned by them even as instruments of protection; they had served their turn in aggressive warfare, but in the defensive warfare that followed their employment was not thought of, till after long and disastrous experience of the insufficiency of other military means. Such being the case, we need not wonder that commercial navigation was neglected. The navigating spirit, in fact, will not of itself create commerce; it appears to have been usually rather the commercial spirit that has taught a people navigation, where it has not been taught by war; and even war does not teach it in the effective manner that commerce does, as we may see at once by comparing the Saxons or the Danes with the Phenicians. The latter had no doubt been a commercial long before they became a navigating, a discovering, a colonizing, and a civilizing people. In the same manner it is their commercial habits, growing out of their permanent geographical position, and not their use and wont of maritime warfare, that has made the English, the descendants of these old Saxons and Danes, the great lords of the sea, planters of nations, and diffusers of civilization in the modern world.

But a power like this can only grow up under a favourable state of circumstances in the world generally, or throughout a large portion of it. The commercial empire of the ancient Phenicians was reared during the most flourishing period of the early civilization of the east; the commercial empire of modern Britain has in like manner arisen in the midst of the later civilization of the west. In the rude and turbulent ages that followed the overthrow of the Roman power in Europe, the existence of an extensive commerce in any hands was impossible. Almost continual wars everywhere, either between one people and another, or between two factions of the same people, or where there was any temporary relaxation of war, the still more brutifying effects of misgovernment and oppression, left no time, no inclination, and no means for carrying on any considerable commerce. The great mass of the people were in all countries sunk in ignorance and in poverty; their miserable condition hardly permitted them to aspire after the enjoyment of anything beyond the absolute necessaries of existence; they were untaught in those arts and processes of industry by which commerce is fed; there had been little or no accumulation of capital, without which there can be no extensive commerce, nor any other species of undertaking that looks much beyond the passing day. It was only by slow degrees that Europe emerged out of this condition, and that the beginnings of modern commerce were nurtured into strength and stability.

We shall now notice the most interesting of the few facts that have been preserved relating to the foreign trade carried on by the Anglo-Saxons, in their chronological order. The first distinct notice which we have upon the subject is not of earlier date than the close of the eighth century. At this time, it appears that some English commodities were carried abroad, and probably some of those of the continent brought to this country, by the devotees who went on pilgrimage to Rome, or by persons who found it convenient to make profession of being so engaged. It is not to be supposed that these pilgrimages opened the first commercial intercourse between England and the continent; but they undoubtedly made the communication much more frequent than it had been before. The practice established by the Romans, of exacting certain payments at each seaport, on the embarkation and landing of goods, appears to have been retained in all the new kingdoms formed out of the western empire; and their amount probably long remained nearly the same that had been paid under the imperial *régime*. Hence the name of customs, or some equivalent term, by which they were called, as if they had been dues universally and immemorially demanded. There is a letter still extant, from the French Emperor Charlemagne to Offa, king of Mercia, and Bretwalda, which seems to

Saxon Ships,
From an Engraving in Strutt's Chronicle of England, made up from various Saxon illuminations.

have been the result of a negotiation between the two sovereigns, respecting the exaction of these duties in the case of the English pilgrims travelling to Rome. The document must be assigned to the year 795, in which Offa died, at the latest; and it may be regarded as the earliest commercial treaty on record, or perhaps that ever was entered into, between England and any other country. It runs as follows: "Charles, by the grace of God, king of the Franks and Lombards, and patrician of the Romans, to our venerable and most dear brother, Offa, king of the Mercians, greeting. First, we give thanks to Almighty God, for the sincere Catholic faith which we see so laudably expressed in your letters. Concerning the strangers, who, for the love of God and the salvation of their souls, wish to repair to the thresholds of the blessed apostles, let them travel in peace without any trouble; nevertheless, if any are found among them not in the service of religion, but in the pursuit of gain, let them pay the established duties at the proper places. We also will that merchants shall have lawful protection in our kingdom according to our command; and if they are in any place unjustly aggrieved, let them apply to us or our judges, and we shall take care that ample justice be done to them." There is more of the letter, which it is unnecessary to quote. We gather from it that the profession of pilgrimage had already been taken advantage of as a cloak for smuggling; and, no doubt, in this way the practice gave an impulse to trade. Even the smuggler is sometimes of use; he may be the means of planting a traffic which would not have grown up without his assistance, and which, of however objectionable a character originally, may eventually assume a legitimate form, and attain to great value and importance. It is conjectured that articles in gold and silver were probably the principal commodities in which these traders from England dealt, who thus put on the guise of pilgrims, with the view of cheating the custom-house of its dues. Such articles, being of small bulk, would be easily concealed in a traveller's baggage; and it appears that even at this early age the English works in gold and silver were famous over the continent.* Already, it may be noted, there seem to have been Jews resident in England and even in the northern kingdom of Northumberland; for among the Excerpts of Archbishop Egbert of York—which must have been compiled between the years 735 and 766—we find a transcript of a foreign canon, prohibiting Christians from imitating the manners of that people, or partaking of their feasts. The Jews have been the introducers or chief encouragers of foreign commerce, especially in jewellery, articles made of the precious metals, and other such luxuries, in most of the countries of modern Europe.

From this date the history of Anglo-Saxon commerce is again nearly a blank till we come down to the reign of Alfred. Of this illustrious prince, it is recorded in relation to the present subject, that he cultivated an intercourse with distant countries, in which he seems to have had in view the extension of commerce as well as other objects. He appears to have kept up a frequent communication with Rome; and his biographer Asser states, that he also corresponded with Abel, the patriarch of Jerusalem, who sent him several valuable presents of oriental commodities. His embassy to the Christians in India is mentioned, not only by Malmesbury and other authorities of the next age, but by the contemporary compiler of the Saxon Chronicle, who says that Bishop Swithelm made his way to St. Thomas, and returned in safety.

* Macpherson's Annals of Commerce, i. 248.

Malmesbury gives Sighelm as the name of the adventurous bishop of Shireburn, and relates that he brought back from India aromatic liquors and splendid jewels; some of the latter, Malmesbury says, were still remaining in the treasury of his church when he wrote, in the twelfth century. Sighelm is stated to have left England in the year 883, and to have gone in the first instance to Rome, from which he probably sailed up the Mediterranean to Alexandria, and then made his way by Bassora to the Malabar coast, where it is certain that a colony of Syrian Christians, who regarded St. Thomas as their apostle, were settled from a very early period. Asser relates that he received, on one occasion, as a present from Alfred, a robe of silk, and as much incense as a strong man could carry: these precious commodities must have been obtained from the East.

But the interest which Alfred took in hearing of remote parts of the earth is most distinctly shown in the accounts he has himself given us of the two voyages of Ohthere and Wulfstan; the first to the North Seas, the second towards the east of the Baltic. These voyages were related to Alfred by the navigators themselves; and he has inserted what they told him in his Saxon translation of the Latin geography of Orosius. It has been observed that Alfred "obtained from Ohthere and Wulfstan such information of the Baltic sea with the adjacent countries, as far exceeded that of professed geographers, either before or after his time, till the route of Ohthere was retraced in the year 1553 by the English navigator Chancellor, who was supposed the original discoverer of the northern passage to Russia."* Ohthere rounded the North Cape, and penetrated into the White Sea, from which he ascended a great river, which must have been the Dwina, on which Archangel now stands. Wulfstan navigated the Baltic as far as to the land of the Estum, the present Prussia. "This Eastland," says his narrative, "is very large, and there be a great many towns, and in every town there is a king; and there is a great quantity of honey and fish. The king and the richest men drink mare's milk, and the poor and the slaves drink mead. There be very many battles between them. There is no ale brewed amid the Estum, but there is mead enough." Pytheas had remarked the same abundance of honey and use of mead, among the people of this coast, twelve centuries before.

It is one of Alfred's many great merits and titles to perpetual and grateful remembrance, that he first called into action, and gave proof of what could be achieved by the natural right arm of England—her maritime strength. The year 887, the sixth of his reign, while he was engaged in that first struggle with the northern invaders which ended so disastrously, is marked as the year in which he fitted out his first few ships. Twenty years later, in his days of prosperity and power, he built a much larger fleet, and introduced certain important improvements in the form of the vessels, which, whether suggested by his own inventive sagacity, or borrowed, as it has been conjectured they might have been, from the galleys then used in the Mediterranean, of which he had obtained models, he showed at least his usual active and inquisitive spirit in searching after, and his good sense in adopting. The Saxon Chronicler says that Alfred's ships were neither like those of the Danes nor those of the Frisians, but were made in a fashion which he himself thought would be more serviceable than that of either. They were twice as long as the aescas, as they were called, of the Northmen, and also higher than theirs; in sailing, they were swifter and less unsteady. Some of them had sixty oars, some more. Yet, notwithstanding the statements of some later writers, we have no authentic account of any attempt by Alfred to create an English mercantile marine. One of his laws only shows that merchant ships sometimes arrived in England in those days; and even this regulation regards not the cargoes of these foreign vessels, but the passengers. The only notice that has been found of the export of any English commodity in the time of Alfred, is the mention of some of the famous native breed of dogs having been sent as a present to Folk, archbishop of Rheims, in France.*

By far the most remarkable and significant event in the whole history of Anglo-Saxon commerce, is the law passed in the reign of King Athelstan, in the second quarter of the tenth century, by which it was enacted that every merchant who should have made three voyages over the sea with a ship and cargo of his own, should have the rank of a thane or nobleman. The liberality of this law has usually been ascribed exclusively to the enlightened judgment of Athelstan; but we are entitled to presume that it must have been also in some degree in accordance with the general feeling of the country; for, not to mention that it must have been passed with the consent of the Witenagemot, it is unlikely that so able and prudent as well as popular a monarch as Athelstan would have attempted in regard to such a matter to do violence to public opinion, without the acquiescence and support of which the measure could have had little efficacy or success. We may take this decree conferring the honours of nobility upon commerce, therefore, as testifying not only to the liberality and wisdom of Athelstan, but also to the estimation in which commerce had already come to be held among the English people. It may be regarded as a proof that the Anglo-Saxons had never entertained much of that prejudice against the pursuits of trade, which we find so strongly manifested during the middle ages, wherever the political and social institutions were moulded upon, and fully animated by the spirit of the feudal system. But it is especially interesting in reference to our present subject, as an indication of the growing importance of English commerce

* Macpherson's Commerce, i. 263.

* Macpherson, i. 265.

and of the public sense of that importance. From this time English fleets and ships of war come to be frequently mentioned. Athelstan assisted his nephew, Louis IV. of France, in his contest with the Emperor Otho, by sending a fleet to the coast of Flanders, to ravage the emperor's territories in that quarter. This was done in conformity with a treaty of mutual defence, which is memorable as the first of the kind ever entered into between the two kingdoms. Edgar's navy, and also that which Ethelred fitted out by a tax upon all the lands in the kingdom to repel the Danes, make a great figure in the history of the next half century. Some accounts make Edgar's fleet to have amounted to between three and four thousand ships—a statement resembling in its style of evident hyperbole the whole history the old monkish chroniclers have given us of this king, whose lavish benefactions to the church have secured him an extraordinary return of their gratitude and laudation. Ethelred's is recorded to have been the most numerous naval armament that had yet been seen in England; so that it must have surpassed that of Edgar.

Even in the disastrous reign of Ethelred, we find indications of the continued progress of trade, both coasting and foreign. In certain laws enacted by Ethelred and his Witan, at Wantage, in Berkshire, it is declared, that every smaller boat arriving at Billingsgate (so old are that landing-place and that name) should pay for toll or custom one halfpenny; a larger boat with sails, one penny; a keel, or what we should now call a hulk, four pennies; a vessel with wood, one piece of wood; a boat with fish coming to the bridge, one halfpenny, or one penny, according to her size. And from other passages of these laws, it appears that vessels were then wont to come to England from Rouen, with wine and large fish; from Flanders, Ponthieu, Normandy, France, Hegge (an unknown place), Liege, and Nivell. Certain German merchants, called the Emperor's men, when they came with their ships, are declared to be worthy of good laws—that is, of being treated with favour; but they were to pay their dues, and were not to forestall the market to the prejudice of the citizens. The dues to be paid by the Emperor's men, who were probably the representatives of some trading company, were two grey cloths and one brown one, ten pounds of pepper, five pairs of men's gloves, and two vessels or measures (called cabillini colenni, the meaning of which is unknown) of vinegar, at Christmas, and the same again at Easter. These were probably the articles of which their cargoes usually consisted. It is also worth notice, that a meeting was held in this reign of the wise men of England and Wales for regulating the intercourse, commercial and general, between the two kingdoms; at which rates of compensation were fixed for slaves, cattle, &c., that might be stolen or injured, and it was agreed to appoint a standing tribunal, consisting of six English and six Welsh lawmen, or persons skilled in the law, to settle all disputes between individuals of the two nations.

Among many other interesting details derived from a volume of Saxon Dialogues, apparently intended for a school-book, which is preserved in the British Museum,* Mr. Turner has quoted the following passage, in which the Merchant, as one of the characters introduced, gives an account of his occupation and way of life: "I say that I am useful to the king, and to ealdermen, and to the rich, and to all people. I ascend my ship with my merchandize, and sail over the sealike places, and sell my things, and buy dear things which are not produced in this land, and I bring them to you here with great danger over the sea; and sometimes I suffer shipwreck, with the loss of all my things, scarcely escaping myself." He is then asked, "What do you bring to us?" to which he answers, "Skins, silks, costly gems, and gold; various garments, pigment, wine, oil, ivory, and orichalcus (perhaps brass); copper and tin, silver, glass, and such like." The principle of all commercial dealings is distinctly enough stated in the answer to the next question,—"Will you sell your things here as you bought them there?" "I will not; because what would my labour benefit me? I will sell them here dearer than I bought them there, that I may get some profit to feed me, my wife, and children." The silks and other Oriental commodities here mentioned were usually, in all probability, obtained from Italy, or sometimes perhaps from Marseilles.

Foreign commodities can only be obtained by the exchange of other commodities produced at home. But the Anglo-Saxons had not much to export. Notwithstanding the flourishing state to which British agriculture had been raised by the Romans, there is no evidence or reason for believing that a single cargo of corn was ever exported from England during the whole of the period now under review. Although, however, there is no positive authority to establish the fact, Mr. Macpherson thinks there can be little doubt that the Flemings, the great manufacturers of fine woollen goods for the whole of Europe, carried away great quantities of English wool in this period, as we know for certain they did in the following ages. That there was an export trade in wool would seem to be indicated by the disproportionate price the fleece appears to have borne compared with the whole sheep, and also by the high price of wool.† Probably also the mines of the different metals yielded something for exportation. The Abbé Raynal has mentioned, but without quoting his authority, that among the traders of different nations who resorted to the fairs established in France by King Dagobert in the seventh century, were the Saxons with the tin and lead of England;‡ and Mr. Macpherson is of opinion that, as we know from Domesday Book, that in the neighbourhood of Gloucester there were iron-works in the time of Edward the Confessor, which had probably been kept up since before the invasion of

* Cotton. MS. Tib. A. iii. † Macpherson, i. 288.
‡ Hist. des Indes, ii. 4.

the Romans, iron, too, as well as lead and tin, may perhaps have been one of the few British exports during the Anglo-Saxon period. This writer thinks it also not impossible that mines of the precious metals may have been wrought at this time in England, and part of their produce exported, although the existence of such mines in the island is unnoticed by any historian since the beginning of the Roman dominion, with the exception of Bede.* It is certain that large sums in gold and silver were raised in the country on different occasions, and much coin or bullion repeatedly carried out of it; and it appears difficult to comprehend whence all this wealth could be obtained with so few manufactures and so little exportable produce of any kind. The early eminence of the Anglo-Saxons in the art of working gold and silver may be taken as affording another presumption that, whencesoever procured, there was no want of these metals in the island. "We have undoubted proof," says Mr. Macpherson, "that the English jewellers and workers of gold and silver were eminent in their professions, and that probably as early as the beginning of the seventh century. . . . So great was the demand for highly-finished trinkets of gold and silver, that the most capital artists of Germany resorted to England; and, moreover, the most precious specimens of foreign workmanship were imported by the merchants."* On the other hand, articles in gold and silver seem to have been the chief description of manufactured goods exported from England in this period.

Among the exports from Britain during part of this period are supposed to have been horses, because one of King Athelstan's laws prohibits their being carried out of the kingdom unless they were to be given as presents. Another part of the export trade, which was probably carried on to a much greater extent, was the trade in slaves. The mission of Augustine, which effected the conversion of the Anglo-Saxons to Christianity, was, it will be recollected, the memorable result of the attention of Augustine's patron, Gregory, having been attracted by the appearance of a group of young Angles exposed for sale as slaves in the market-place of Rome. Afterwards several laws and ecclesiastical canons were passed prohibiting the sale of Christian slaves to Jews or Pagans. Finally it was enacted that no Christians, and no persons who had not committed some crime, should be sold out of the country. But William of Malmesbury, who wrote nearly a century after the Conquest, affirms that the practice of selling even their nearest relations had not been alto-

* Macpherson, i. 291.

* Macpherson, i. 290.

ENTRANCE OF THE MINE OF ODIN, an ancient Lead-Mine in Derbyshire: the Hill called Mam Tor, in the distance.

gether abandoned by the people of Northumberland in his own memory. And in the contemporary biography of Wulfstan, who was Bishop of Worcester at the time of the Conquest, the following curious account is given:—"There is a sea-port town called Bristol, opposite to Ireland, into which its inhabitants make frequent voyages on account of trade. Wulfstan cured the people of this town of a most odious and inveterate custom, which they derived from their ancestors, of buying men and women in all parts of England, and exporting them to Ireland for the sake of gain. The young women they commonly got with child, and carried them to market in their pregnancy, that they might bring a better price. You might have seen with sorrow long ranks of young persons of both sexes, and of the greatest beauty, tied together with ropes, and daily exposed to sale; nor were these men ashamed, O horrid wickedness! to give up their nearest relations, nay, their own children, to slavery. Wulfstan, knowing the obstinacy of these people, sometimes stayed two months among them, preaching every Lord's Day, by which, in process of time, he made so great an impression upon their minds that they abandoned that wicked trade, and set an example to all the rest of England to do the same."* But for this remarkable passage it would scarcely have been suspected that there ever was a time when the natives of England were regularly exported to be sold as slaves to the Irish. Their principal purchasers were probably the Danes, or Ostmen (that is, Eastern men), as they were called, who were at this time the dominant people in Ireland, and especially were masters of nearly the whole line of the coast opposite to Britain. They appear to have carried on a considerable commerce both with England and other countries. Chester, as well as Bristol, is particularly mentioned as one of the ports to which Irish ships were accustomed to resort about the time of the Norman Conquest. William of Malmsbury describes the inhabitants of Chester as depending in his day upon Ireland for a supply of the necessaries of life; and, in another place, he speaks of the great distress the Irish would suffer if they were deprived of their trade with England. Marten skins are mentioned in Domesday Book among the commodities brought by sea to Chester; and this appears, from other authorities, to have been one of the exports in ancient times from Ireland. Notices are also found of merchants from Ireland landing at Cambridge with cloths, and exposing their merchandise to sale.† Other English ports which are noticed as possessed of ships at the time of the Conquest, or immediately before that event, are Pevensey, Rumney, Hythe, Folkstone, Dover, Sandwich, Southwark, and London. Bede speaks of merchants' ships sailing to Rome; and it appears that trading-vessels sometimes joined together, and went out armed for their mutual protection.‡

At all the above places, and at every other sea-port in the kingdom, customs seem to have been exacted upon the arrival and departure of ships and goods, both by the king and by the lord, generally called the earl or comes, whose property or under whose protection the town was; and trade was besides fettered by many restrictive regulations. At Chester, for instance, if a ship arrived or sailed without the king's leave, she was subject to a fine of forty shillings to the king and the earl for every one of her crew. If they came against the king's express prohibition, the ship, the men, and the cargo were forfeited to the king. Ships that came in with the king's permission might sell quietly what they brought, paying at their departure to the king and the earl four pennies for every last, or load. Those that brought marten skins, however, were bound to allow the king the pre-emption of them, and, for that purpose, to show them to an officer before any were disposed of, under a penalty of forty shillings. It is possible, however, that some of these oppressive regulations may have been first imposed by the Conqueror. At the time when the account in Domesday Book was drawn up, the port of Chester yielded to the crown a revenue of forty-five pounds, and three timbres (whatever quantity that may have been) of marten skins.

Of the internal trade of England during this period we know very little. That it was on a very diminutive scale might be inferred from the single fact, that no person was allowed to buy anything above the value of twenty pennies, except within a town, and in the presence of the chief magistrate, or of two or more witnesses. Such at least is the regulation found in the laws of King Hlothaere of Kent, who reigned in the seventh century. Another enactment in the same collection is, that "if any of the people of Kent buy anything in the city of London, he must have two or three honest men, or the king's port-reve (who was the chief magistrate of the city), present at the bargain." And a third of Hlothaere's laws is,—"Let none exchange one thing for another except in the presence of the sheriff, the mass-priest, the lord of the manor, or some other person of undoubted veracity. If they do otherwise they shall pay a fine of thirty shillings, besides forfeiting the goods so exchanged to the lord of the manor."

These regulations were probably intended in part to prevent fraud and disputes, and they might perhaps be in some measure serviceable for that purpose in an age when writing was not in common use; but there can be no doubt that they had principally in view the protection of the revenue of the king and the lord of the manor; to each of whom, it appears from Domesday Book, a certain proportion of the price of everything sold for more than twenty pennies, was paid, the one-half by the buyer, and the other by the seller. The amount here specified would prevent the rule from affecting the ordinary purchases of the people in shops, to which it must be supposed they were permitted to resort for the necessaries of life without any of these annoying formalities. The transactions to which it applied would chiefly take place at the

*Anglia Sacra, ii. 258. † See Turner, iii. 113. ‡ Ibid.

public markets or fairs, which appear to have been established in various parts of the country, and which in all the greater towns were probably held every week. Originally the Sunday seems to have been the usual market-day; but the repeated efforts of the church at length effected the general substitution of Saturday. Besides the weekly markets, however, there were probably others of a more important kind held at greater intervals. At many of the markets, besides the duties exacted upon all sales, a toll appears to have been demanded either from every individual frequenting the market, or at least from all who brought goods to dispose of. Most of these commercial usages of the Anglo-Saxons were inherited from their predecessors the Romans.

They had also, to a certain extent, the advantage of the facilities of communication between the different parts of the country, which had been created while it was in the occupation of that great people. The four great highways appear to have received Saxon names, and they were undoubtedly maintained in use during the whole of the Saxon period, as were also, it may be presumed, most of the other roads, or streets, as they were called, with which the country was intersected in all directions. And besides the navigable rivers, it has been supposed that artificial canals were cut in some places. A canal in Huntingdonshire, in particular, called Kingsdelf, is mentioned in the Saxon Chronicle under the year 963; and several of the boundary ramparts, erected primarily for the purposes of defence, appear to have had wide ditches, along which boats might be dragged.

The subject of the Money of the Anglo-Saxons is in some parts extremely perplexed and obscure. The different denominations of money of which mention is found, are, the pound, the mark, the mancus, the ora, the shilling, the thrimsa, the sceatta, the penny, the triens, the halfling, or halfpenny, the feorthling, or farthing, and the styca, or half-farthing. Of some of these, however, we know with certainty little more than the names.

The first difficulty that occurs is in regard to which of these kinds of money were actual coins, and which were merely nominal, or money of account. Upon this part of the subject, Mr. Ruding, from whom it has received the latest as well as the most elaborate investigation, comes, though not without hesitation, to the following conclusion: "That the penny, halfpenny, farthing, and half-farthing were actual coins; as was probably the triens, which divided the penny into three equal parts; and that the mancus, the mark, the ora, the shilling, and the thrimsa, were only money of account; or, that if the mancus was ever current among the Anglo-Saxons, it was a foreign coin, and was never imitated in their mints."* There is no doubt that the pound was merely money of account. The sceatta seems to have been rather a general expression for a piece of money, than the denomination either of a coin or of a particular sum. Others, however, have held that the sceatta, the mancus, the shilling, the thrimsa, and perhaps also the ora, were all coins.

The next question that arises relates to the metal of which each coin was made. Mr. Ruding is of opinion, "that no evidence has yet been adduced to prove that the Anglo-Saxons struck any gold money; but that the balance of probability apparently inclines to the determination that no such money was issued from their mints."* By others the mancus is supposed to have been of gold; and Mr. Turner thinks that both gold and silver were used in exchanges in an uncoined state.† It is certain that mention is repeatedly made of payments in gold. It is agreed that the penny, the halfpenny, the farthing, and the triens (if that was a coin) were all of silver; and that the styca was of copper, or of that metal with an alloy. In fact, no Saxon coins have yet been discovered except some of those last mentioned. Of pennies and stycas some large hoards have been found within these few years. In April, 1817, a wooden box was turned up by a ploughman in a field near Dorking, in Surrey, which contained nearly seven hundred Saxon pennies, principally of the coinages of Ethelwulf, the son and successor of Egbert, and of Ethelbert, the father of Alfred, but partly also of those of preceding kings of Wessex, of Mercia, and of East-Anglia.‡ Eighty-three silver coins of King Ethelred, and two of his father, King Edgar, were found in 1820, by a peasant while digging a woody field in Bolstads Socked, in Sweden, and are now deposited in the Royal Cabinet of Antiquities at Stockholm.§ And in 1832, a brass vessel containing about eight thousand stycas, principally of the kings of Northumberland, was found at Hexham in that county. About five thousand of them were recovered from the persons into whose hands they had fallen; and a selection of about three hundred of them is now in the British Museum.‖

But the most important, and unfortunately also the darkest question of all, is that of the determination of the value of these several coins or denominations of money. There has been the greatest doubt and difference of opinion both as to the absolute value or weight, and as to the relative value, of nearly every one of them. Almost the only thing which is perfectly certain is, that the pound was always understood to be a full pound of silver. It appears, however, to have been not the common troy pound, but another measure, long known in Germany by the name of the Cologne pound, and used in this country as the Tower or Mint weight down to the reign of Henry VII. It was three quarters of an ounce less than the pound

* Annals of the Coinage, i. 316. (Edit. of 1819.)

† Hist. of Anglo-Saxons, ii. 470, 471.

‡ See account of these Coins by Taylor Combe, Esq., in the Archæologia, vol. xix. (for 1821) p. 110.

§ Turner's Anglo-Saxons, ii. 480.

‖ See account of these stycas, by John Adamson, Esq., with engravings of some hundreds of them, in the Archæologia, vol. xxv. (for 1834), pp. 229-310; and vol. xxvi. (for 1836) pp. 346-8.

troy, and was equal, therefore, to only eleven ounces and a quarter troy weight, that is, to 5400 grains.

Out of this amount of silver, throughout the whole Saxon period, the rule seems to have been to coin 240 silver pennies, each of which would therefore weigh 22½ of our grains. Accordingly, this is about the average weight of the Saxon pennies that have been found. Our present pound no longer means a pound of silver of any denomination; but the old relation between the pound and the penny, it will be remarked, is still preserved—the value of the pound is still 240 pence. A few passages in old writers and documents have inclined some antiquaries to suspect that the Saxons had two kinds of pennies, a greater and a less; but, on the whole, this notion does not seem to be tenable. The name of the penny in Saxon is variously written,—peneg, penig, peninc, pening, peningc, penning, and pending.

Supposing the value of the penny to have been thus ascertained, we have obtained that also of each of the inferior coins. The halfpenny, which, as existing specimens show, was also of silver, would weigh about 11¼ of our grains, and the feorthling, or farthing, about 5⅝. But no Saxon farthings have been discovered, and we do not know whether the coin was of silver or copper. The styca was of copper much alloyed, in other words, of bronze; but, as it was the half of the farthing, its precise value would be estimated at 2⅛ grains of silver. All the stycas that have yet been found are from the mints of the Northumbrian kings and the Archbishop of York; but the circulation of the coin appears to have been general throughout England. If there were such coins as the thrimsa and the triens, the former at least was probably of silver. The value of the thrimsa seems to have been three pennies, or 67½ grains of silver; that of the triens, the third of a penny, or 7½ grains of silver.

These conclusions, as we have intimated, are not unattended with some difficulties; but they seem, on the whole, to be tolerably well made out, and at any rate it would only embarrass the statement, without adding any information of the least interest or value for our present purpose, to enter upon a discussion of the doubts or objections that have been raised upon certain points.

One of the main hinges on which the investigation of the subject of the Saxon money turns is the question of the nature and value of the shilling. The Norman shilling, like that of the present day, was the twentieth part of the pound, and consisted of twelve pence; and this is the scale according to which the payments in Domesday Book are commonly stated. The scill or scilling of the Saxons is the denomination of money most frequently mentioned in their laws and writings, and it appears to have been that in which sums were usually reckoned; yet no Saxon shilling has ever been found, and the different ancient accounts and computations in which it is mentioned seem to be only reconcileable upon the supposition that it was of fluctuating value. Both these facts go to support the conclusion that the shilling was not a coin, but only a denomination of money of accompt. At one time it appears to have contained five, and at another only four pennies; if there were not indeed two sorts of shillings circulating together of these different values.* When the shilling contained five pennies its value was the forty-eighth part of the pound, or 112½ grains troy of silver; when it contained four pennies only, it was the sixtieth part of the pound, and its value was only 80 grains troy of silver. The principal evidence for there ever having been a shilling containing only four pennies is a law of Athelstan, in which 7200 shillings are distinctly stated to be equal to 120 pounds; in which case there must have been sixty shillings in each pound. But there is equally good evidence that five pennies was the value of the shilling both before and after the time of Athelstan; and it has therefore been supposed that the shilling was depreciated by that king, and afterwards restored to its ancient value. In the laws of Canute the shilling appears clearly to be reckoned the forty-eighth part of the pound; and Elfric, the grammarian, who wrote in this age, expressly states that there were five pennies in the shilling.

If the mancus ever was a coin, Mr. Ruding is of opinion that it became latterly merely a denomination of money of accompt. The commonly received etymology of the word, from the Latin *manu cusum*, struck with the hand (though this etymology may be doubted), would seem to favour the notion that it had been a coin at one time; but as we find the mancus of silver mentioned as well as the mancus of gold, it must be concluded that the name came to be afterwards used as that simply of a certain sum, for it is improbable that any coin was in use of so large a size as a silver mancus would have been. The value of the mancus is stated by Elfric to have been thirty pennies, in the same passage in which he states five pennies to have made a shilling. The mancus, therefore, contained six Saxon shillings, or was of the value of 675 grains troy of silver, being rather more than is contained in seven of our present shillings. It is observable that a gold coin, sometimes called a mancus, in other cases known by other names, circulated during the middle ages in many countries both of Europe and the East, the weight of which was 56 grains troy, which would be just about the weight of gold equivalent to thirty Saxon pennies, on the supposition, which other considerations render probable, that the relative value of gold and silver was then as twelve to one. Of this weight were the mancuses or ducats of Italy, Germany, France, Spain, and Holland, the sultani of Constantinople, the sequins of Barbary, and the sheriffs of Egypt.

The mark used to be supposed the same with the mancus, but this opinion is now quite exploded. The mark appears to have been a Danish denomination of money, and to have been introduced into this country by the Danish settlers, the first men-

* Mr. Ruding is inclined to think that this was the case. See his Annals of the Coinage, i. 310.

tion of it being found in the articles of agreement between Alfred and Guthrun. Some of the notices would seem to imply that, at first, the mark was accounted equivalent in value to only a hundred Saxon pennies; but it certainly came eventually to be estimated at one hundred and sixty pennies, that is, at two-thirds of the pound. Two-thirds of a pound is still the legal value of a mark. The mark, therefore, may be set down as of the value of 3600 grains troy of silver. The mark has never been supposed to be a real coin, except by those who have taken it for the same with the mancus.

The ora was also a Danish denomination, and appears to have been the eighth part of the mark. Its value, therefore, would be twenty Saxon pennies, or 450 grains troy of silver. There appears also, however, to have been an ora which was valued at only sixteen pennies.

The amount of silver, 5400 troy grains, which made an Anglo-Saxon pound, is now coined into 2*l.* 16*s.* 3*d.* sterling. The value, therefore, of each of the Saxon coins, according to the view that has now been taken, would be as stated in the following Table:—

The Pound,—Money of Account.....	equivalent to	5400 grains troy of Silver,...or.....	£2	16 3
The Mark,.....ditto.....		3600.....or.....	1	17 9
The Mancus,.....ditto (probably).....		675.....or about		7 0½
The Ora,.....ditto.....		450.....or.....		4 8¼
The greater Shilling, ditto (probably).....		112½.....or.....		1 2
The smaller Shilling, ditto (probably).....		90.....or.....		11¼
The Thrimsa,.....ditto (probably).....		67½.....or.....		8⅛
The Penny,.....Silver Coin,.....weighing....		22½, value in sterling money about		2¾
The Triens,.....ditto (probably).....		15.....		2
The Halfpenny,.....ditto.....		11¼.....		1¼
The Farthing,.....ditto (perhaps) ....about....		5½.....		¾
The Styca, ...Copper Coin, ...equivalent to about		2¾.....about ⅓ of a Farthing.		

The Saxon coins are generally sufficiently rude in workmanship; and this circumstance has been used as an argument to prove that the Saxons brought the art of coining with them to Britain from Germany, and did not acquire it by imitation of the Roman models. The earliest Saxon coin that has been appropriated is one in silver (a penny apparently, though commonly called a sceatta) of Ethelbert, king of Kent, who reigned from 561 to 616, the patron of St. Augustine. As the coin does not exhibit the usual Christian symbol of the cross, it may be presumed to have been struck before the year 597, in which Ethelbert was baptized. According to Mr. Ruding's description, "it bears on the obverse the name of the monarch, and on the reverse a rude figure, which occurs on many of the sceattæ, and which is supposed to be intended to represent a bird." But other coins that exist without names, or with names that cannot be deciphered, may be older than this. Besides the kings of the different states of the Heptarchy, and afterwards of all England, the Archbishops of Canterbury and York had mints and issued money in the Anglo-Saxon times. In addition to the name of the king or the archbishop, the coins usually contain that of the moneyer by whom they were struck, and from the time of Athelstan also that of the town where the mint was situated. The later kings appear to have usually had numerous moneyers, and mints in all the principal towns throughout the kingdom.*

Besides the coins of their own minting, several foreign coins appear to have circulated among the Anglo-Saxons, especially the byzantine gold solidi, commonly called byzantines, or byzants, each weighing seventy-three grains troy, and being of the value of forty Saxon pennies, or (at their estimation of the relative values of gold and silver) nine shillings and fourpence-halfpenny of our present money. Thus St. Dunstan is recorded to have purchased the estate of Hindon (now Hendon), in Middlesex, from King Edgar, for 200 gold byzantines, and then to have presented it to the monks of St. Peter in Westminster.* There were also silver byzantines, which, according to Camden, were valued at two shillings each. At an early period even some of the Roman imperial money might remain in use. "That gold and silver," Mr. Turner remarks, "had abounded in the island while it was possessed by the Romans and Britons, the coins that have been found at every period since, almost every year, sufficiently testify; and it was the frequency of these emerging to view which made treasure-trove an important part of our ancient laws, and which is mentioned by Alfred as one of the means of becoming wealthy."†

Slaves and cattle passed also as a sort of circulating medium during this period so generally that they are spoken of as living money. Cattle, the first wealth of mankind, were probably in most countries the first money; that is to say, commodities were valued at so many cattle, and cattle were commonly given in exchange for all other things. When metal money, therefore, was first introduced,

* Comp'ete lists of the moneyers and mints in each reign, as far as they can be recovered, are given in Ruding's elaborate and exact Annals of the Coinage, 2nd Edit. 5 vols. 8vo. and 1 4to. of Plates, Lon. 1819. On the subject of the Anglo-Saxon Coinage, the reader may also consult Bishop Fleetwood's Chronicon Preciosum, 2nd Edit. 8vo. Lon. 1745; the Introduction to Leake's Historical Account of English money from the Conquest, 2nd Edit. 8vo. Lond. 1745 (but the views of these earlier writers have been corrected in some important respects by the results of subsequent investigation); Pegge's Dissertations on some Anglo-Saxon Remains, 4to. Lon. 1756; Clarke's Connection of the Roman, Saxon, and English Coins, 4to. Lon. 1767 (both Pegge and Clarke endeavour to show that the Saxons coined gold); and Folkes's Tables of English Coins, published at the expense of the Society of Antiquaries, 4to. Lon. 1763 (in this work was announced the important discovery that the Saxon pound was the Old Tower or Cologne pound).

† Camden's Britannia, 399. † Hist. Ang. Sax. iii. 237.

it was looked upon not as a convenient representative of commodities or property of all kinds, but only as a substitute for cattle; some of the oldest coins have the figures of cattle stamped on them; and in some languages money was actually called cattle. Thus *pecus*, cattle, is the origin of the Latin *pecunia*, money, and of our English *pecuniary*. The same thing is very curiously shown by the history of another still existing term, the word *mulct*, meaning a fine or pecuniary penalty. Mulct is a translation of the Latin *mulcta*, or, as it is more properly written, *multa*, which was an ancient Roman law-term for a fine, but which the Roman lawyers and antiquaries themselves, as we learn from Aulus Gellius, admitted to have originally meant a sheep, or rather a ram. Varro asserted that it was a Samnite word, and that the Samnites, the descendants of the old Sabines, had used it in that sense within his own recollection. It is remarkable that the original word still survives, in its original signification, in the Celtic dialects of Ireland and Scotland, in the former of which a wether is to this day *molt*, and in the latter *mult*.* Hence, in fact, come the French *mouton*, and our English *mutton*. The Anglo-Saxons, it would appear, although they had metallic money, had not completely passed out of the state of only commencing civilization in which cattle serve the purposes of money. A certain value seems to have been affixed by the law to horses, cows, sheep, and slaves, at which they might be seized by a creditor in payment of a debt due to him; and it is supposed that all kinds of fines, or pecuniary penances, imposed either by the state or the church, might be discharged either in dead or living money. The church, however, which to its honour from the first opposed itself to slavery, and greatly contributed by its systematic discouragement and resistance to put down that evil, early refused to accept of slaves instead of money in the payment of penances. In the parts of Britain not occupied by the Saxons, it may be doubted if during the present period any metallic money was coined. No coins either of Scotland or of Wales of this antiquity have ever been found. Considering the intercourse, however, that in the later part of the period subsisted between both of these countries and England, it is impossible to suppose that, although they may not have minted any money themselves, they could be unacquainted with its use. A few of the Saxon coins probably found their way both to the Welsh and Scotch, and supplied them with a scanty circulation. The Welsh laws indeed show that the denominations, at least of money, were familiarly known to that people; but they seem to show, also, by the anxious minuteness with which they fix the price of almost every article that could become the subject of commerce, that a common representative of value and medium of exchange was not yet in common use. These Welsh laws, for instance, in one section, lay down the prices of cats, of all different ages, and with a most elaborate discrimination of species and properties. This may be regarded as a rude attempt to provide a substitute for barter without a coinage; but the system which it would aim at establishing is in reality anything rather than an improvement of simple, unregulated barter. The real price, or exchangeable value, of a commodity, depending as it does upon a variety of circumstances which are constantly in a state of fluctuation, is essentially a variable quantity, and we can no more fix it by a law than we can fix the wind. A law, therefore, attempting to fix it would only do injustice and mischief; it would, in so far as it was operative, merely substitute a false and unfair price of commodities for their natural and proper price.

When the prices of commodities, however, are thus settled by the law, it may be presumed that the prices assigned are those generally borne by the commodities at the time; and in this point of view the law becomes of historic value as a record of ancient prices. Thus, from one of the Saxon laws of King Ethelred we learn that in England the common prices of certain articles, about the end of the tenth century, were as follows:—

			£.	s.	d.	
Of a Man, or slave	A pound. . .	equivalent to	2	16	3	sterl.
Horse . .	Thirty shillings	,,	1	15	2	
Mare or colt	Twenty shillings	,,	1	3	5	
Ass or mule	Twelve shillings.	,,	0	14	1	
Ox . . .	Six shillings	,,	0	7	0¼	
Cow . . .	Five shillings	,,	0	5	6	
Swine . .	One shil. and 3 pennies	,,	0	1	10¼	
Sheep . .	One shilling	,,	0	1	2	
Goat . .	Two pennies	,,	0	0	5¼	

We are not to suppose, however, that these legal rates were always adhered to in actual sales and purchases. The prices of all commodities among the Saxons, no doubt rose and fell as they do at present, and with much more suddenness and violence than now; for, in that rude period, from the scarcity of capital, and the comparatively little communication between one place and another, supplies of all kinds were necessarily much more imperfectly distributed than they now are over both time and space; and any deficiency that might, from any cause, occur, was left to press with its whole severity upon the particular moment and the local market, without the greater abundance of other places or other seasons being admitted to relieve it. Comparative, though not absolute steadiness of prices, or at any rate a steady and calculable, in lieu of an irregular and jolting movement of prices, especially of those of the great necessaries of subsistence, is, on the whole, the accompaniment of an advanced civilization, the general character and result of which, indeed, may be said to be to repress irregularities of all kinds, and to bring all social processes nearer and nearer to the equability of those of mechanics. Several of the articles enumerated in the above list, we find mentioned elsewhere, as bearing a variety of other prices. In one case, for instance, we find a slave purchased for half a pound; in another, for an yre of gold (the amount of which is not known); in another, for three mancuses, or about a guinea; in another, for five shillings and some pence.* In

* Grant's Origin and Descent of the Gael, 145.

* See these instances collected by Mr. Turner, from Hickes and other authorities, in Hist. Ang. Sax. iii. 90.

these purchases it is generally mentioned, that besides the price, the toll was paid. "The tolls mentioned in some of the contracts for slaves," observes Mr. Turner, "may be illustrated out of Domesday Book. In the burgh of Lewis, it says, that at every purchase and sale, money was paid to the gerefa: for an ox, a farthing was collected; for a man, four pennies." Slaves, of course, differed very considerably from one another in real value. On the other hand, the same sum at which a sheep is here rated at the end of the tenth century, appears to have been also its legal price three hundred years before. At least, in the laws of Ina, king of the West Saxons, who reigned at the close of the seventh century, a sheep with its lamb is valued at a shilling. In another of Ina's laws, the fleece alone is valued at two pennies, that is, at two-fifths of the price of the entire sheep and lamb. This high price of wool, as has been mentioned above, is accounted for on the supposition that there was some foreign trade in that commodity in the Anglo-Saxon times. By a law of Edgar, in the latter half of the tenth century, the highest price which could be taken for a weigh of wool was fixed at half a pound of silver; "being," observes Mr. Macpherson, "if the weigh contained then, as now, 182 pounds of wool, near three-fourths of a (Saxon) penny (equivalent to nearly twopence in modern money) for a pound; a price which, as far as we are enabled to compare it with the prices of other articles, may be thought high."*

Of the prices of other articles, however, in the Anglo-Saxon times, with the exception of articles of agricultural produce, we scarcely know anything. Money being then comparatively scarce, the prices of most commodities were of course much lower than they now are—that is to say, they might be purchased for a much smaller amount of money. But there is no uniform proportion between the prices of that period and those of the present day, some things being nominally dearer than they now are, as well as many others nominally cheaper. Books, for instance, were still scarcer than money; and accordingly their prices were then vastly higher than at present. We shall have occasion in the next chapter to mention some of the prices that were given by the Anglo-Saxons for books. It follows, that no correct estimate can be formed of the proportion generally between the value of money in those times and its value at present; for the calculation that might be true of some articles, would not hold in regard to others. Some conclusions, indeed, may be deduced from the comparison of the prices both of the same article at different periods, and of different articles during the same period; but these will be most conveniently adverted to in speaking, as we shall now proceed to do, of the several arts or processes of industry of which the commodities in question are the products.

In giving some account of the useful arts during the Anglo-Saxon period, it is scarcely possible to exhibit a sketch of their progressive state from its commencement to its close; and yet, during the lapse of six centuries, external circumstances, varying in their character and in the influence which they exercised, must, no doubt, at certain times, have given an impulse to industry, while at others the arts were repressed or continued in an unimproving and languid state. But it may safely be concluded that, on the whole, the various arts which contribute to the comfort or embellishment of life were in a state of greater advancement during the reigns of the last Anglo-Saxon monarchs than they could possibly be under the fierce domination of their restless and warlike ancestors who overran the island in the fifth century. Still the extent of that improvement which undoubtedly took place, was small considered with reference to so long a period, though it was as considerable as could be expected under the circumstances of the times. The last fifty years have produced in our own day greater changes, as compared with the period of similar length by which it was immediately preceded, than all the social changes which occurred during the Anglo-Saxon age, even when the extreme points, which offer the most striking contrasts, are compared with each other. The influence of order and the laws may be supposed in ordinary circumstances to have gradually increased in efficacy; and under this protection men would pursue their avocations with augmented security both of life and property; but there was nothing which could act with sudden and electric power on the nation, or quicken into fuller life and activity the germs of civilization which were advancing with such slow development.

In all the means by which a people can be sustained in a state above want, and supplied with food, shelter, and clothing, the Saxon invaders were inferior to their immediate predecessors in the occupation of the island, the Britons, who had derived their knowledge of the arts by which this is accomplished from the practices of their Roman conquerors. The produce they raised from the soil was sufficient not only for the consumption of the inhabitants of Britain, including a considerable non-agricultural population, but a surplus remained which was exported to Rome. Agriculture had been benefited by the improved methods of cultivation employed by the Romans; and when they left the island, it was capable of diffusing considerable wealth. But the incursions of the northern barbarians and the ravages which they committed in the better cultivated districts of the south, were calculated to act with most fatal effect on agricultural industry, and to weaken the stimulus to exertion by frequent and often successful attempts to rob the cultivator of the fruits of his labour. The advancement of agriculture as an art it would be hopeless to anticipate under such discouragements; and, judging only by the known operation of human motives, its decline would be inevitable, as all the best allurements to industry would be taken away, and it was verging to that point when the land would be tilled

* Annals of Commerce, i. 288.

only to such an extent as would afford little beyond a narrow subsistence. Such was the state of agriculture when the Britons invited over the Saxons; and from them they could derive no improvements in this useful art, even if their protection had enabled it to recover from the depressed condition in which it was placed by the ravages of the Picts previous to their arrival. But the subsequent proceedings of the Saxons, by engendering acts of rapine and warfare, still further oppressed industry. When, however, the Saxon invaders had become dominant, they applied themselves to the cultivation of the soil, and the Britons in all probability were to a great extent their servants as well as their agricultural teachers. From this point agriculture began to emerge into that state in which we find it during the Anglo-Saxon period. Leaving these general views we proceed to notice the few facts relative to the state and practice of agriculture, and the other useful arts which have been handed down to us on good authority.

The great bulk of the Anglo-Saxon population were engaged in producing food. A considerable portion of each estate was woodland, which furnished a supply of fuel and timber for building; and farms generally, though varying in size, were divided as at present, though in different proportions to those which now prevail, into meadow, pasture, arable, and woodland. Though the last-mentioned description of land was everywhere in the greatest abundance, the laws carefully protected both timber and growing trees, a wite, or penalty to the state, of thirty shillings being incurred by each offence, besides a payment of five shillings for each large tree that was cut down, and five pennies for every other; these two latter sums being probably an approximative estimate of the damage committed. The value of a tree appears to have been determined by the number of swine which could be gathered under its branches. The boundaries of property were accurately defined, and were indicated by a ditch, a brook, a hedge, a wooden mark, or some other prominent object. Gates are mentioned, so that the inclosures were protected from the devastations of cattle. This was only necessary in the case of their arable land and that from which they obtained their crops of hay. There are many regulations concerning the pasturing of cattle in the Anglo-Saxon laws. In Wales, as appears from the Welsh laws,—and the case was probably the same in England,—the common lands were pastured by the cattle belonging to several owners under the direction of a neatherd and his assistants. Pasturage, indeed, is the most important department of rural economy when agriculture is in a rude state. "The English people," says Stow, referring to this period, "might have been said to be graziers rather than ploughmen, for almost three parts of the kingdom were set apart for cattle." This must necessarily be the case when cattle run on the uncultivated lands, and require merely the superintendence of a neatherd or shepherd. A very trifling amount of labour is demanded compared with that which arable land requires. It is not profitable under these circumstances to fatten cattle at a great cost with the produce of cultivated land, and hence cattle generally form the chief wealth of a people who have not made much progress in agriculture. This was the case of the inhabitants of Britain under the Roman domination, and it had not become altered in the Anglo-Saxon times. But though cattle formed a large proportion of the property of an Anglo-Saxon landed proprietor, an erroneous idea is apt to be formed of the degree of wealth which the possession of this description of agricultural stock implies. They were abundant because land was exceedingly cheap. An acre of land appears to have been frequently sold for the price of four sheep. Those animals which could feed on waste and common lands were cheap, while such as it was necessary partly to support by the produce of land cultivated for the purpose were disproportionately dear. A cow, as we have seen, was of six times less value than a horse, and an ass or mule was double the price of an ox. The value derived from neat stock must have been small, and the system of managing them very imperfect, when ewes were milked for the sake of the cheese which was made from their milk. The month of May was, however, denominated Trimilchi, because they commenced milking their cattle three times a-day. To keep live stock during a long winter is sometimes a difficult task in the present day, with all the natural and artificial aids obtained from grasses of a more valuable kind, better and larger crops of hay, green food in winter, and various modes of preparing artificial food; but when none of these improvements existed, it may easily be conceived that cattle, although in large herds, would not be so productive of wealth as their numbers might lead us at first to suppose. The practice in the Hebrides within the last half century probably resembled in many points this department of Anglo-Saxon husbandry. It was as follows, and the results would doubtless be somewhat similar in the case of the Anglo-Saxons:—"With the exception of the milch-cows, but not even of the calves, they were all wintered in the field. If they were scantily fed with hay, it was coarse and withered, and half rotten; or if they got a little straw, they were thought to be well taken care of. One-fifth of the cattle, on an average, used to perish every winter from starvation. When the cold had been unusually severe, and the snow had been long on the ground, one-half of the stock has been lost, and the remainder have afterwards been thinned by the diseases which poverty had engendered."* Dr. Walker† adduces a fact which shows that there may be a large amount of live stock existing at the same time with an unproductive and poor system of husbandry:—"A farm in Kintail was found to have on it 40 milch cows, which, with their young stock, from a calf to a four-year old, made about 120 head of cattle; besides 80

* Cattle; Lib. of Useful Knowledge, p. 67.
† Agricultural Survey of the Hebrides.

ewes and 40 goats, which, with their young, were about 250; and 10 horses. Yet this farm, with arable land sufficient to supply all the family, was rented at 20*l.* a-year." This was about the year 1810. The Saxon Chronicle mentions several years in which there was an extraordinary mortality among cattle. The year 897 and the two previous years were thus remarkable. The year 986 is noted for the great murrain of cattle; and in 1041 it is stated that more cattle died, either owing to various diseases or the severity of the weather, than any man ever remembered. In 1054, the writer of the Chronicle states, "was so great loss of cattle as was not remembered for many winters before." There can be little doubt that the Anglo-Saxon system of cattle husbandry was exceedingly imperfect, that every year probably some loss was sustained in consequence, and that on the whole it bore considerable resemblance to that which up to a recent period existed in the Hebrides. Cattle were, however, fattened for slaughter. Two fatted cows are mentioned, in an existing Anglo Saxon manuscript, as forming a portion of the annual rent paid for the occupation of land.*

The possessions of the Anglo-Saxons in swine were, there is reason to believe, as available, or at least nearly so, as their herds of neat cattle, in furnishing them with supplies of flesh-meat. The sheep, it has already appeared, was prized chiefly on account of its fleece, which was valued at two-fifths of the price of the whole sheep. There are several additional facts which denote that it was less on account of their flesh than for the materials for clothing which the fleece afforded, that sheep were bred and reared. The average price of a sheep was about four shillings; but the value which it would bring varied of course according to the season, and until a fortnight after Easter it was not considered worth more than a shilling. The fleece was not to be shorn until Midsummer, and from Easter until this period it was gradually increasing in value, owing to the increase of the wool, until it reached its highest price, just before the time of shearing. On the other hand, swine were of no value except as food, and yet they were kept in great numbers during the whole of the Anglo-Saxon times, and none of the common occupations of husbandry are more frequently mentioned than that of the swineherd. They could be driven into the woods and on the waste lands equally well with neat cattle; and the food which they picked up there—the oak and beech-mast—was much superior for its fattening effects to that which was the spontaneous growth of the pastures in which cattle were fed.† Swine could therefore be fattened on what may be regarded as the surplus bounty of nature, while cattle could only be rendered fit for slaughter by a more expensive process—the consumption of cultivated produce, the fruits of much

BEATING ACORNS FOR SWINE. Cotton MS. Nero, C. 4.

previous labour. Great numbers of swine therefore were naturally kept, as they were a stock easily provided for, and supplying nutritious food at a small expense. In Domesday Book pannage (swine's food) is returned for 16,535 hogs in Middlesex; in Hertfordshire for 30,705; and in Essex, which was one continued forest, for 92,991. In the will of a nobleman two thousand swine are left to his two daughters; another nobleman gives to his relations a hide of land with one hundred swine, and he directs two hundred swine to be given to two priests in equal proportions for the good of his soul. An individual gives land to a church on condition that two hundred swine are fed for the use of his wife. Besides the live stock already mentioned, they had goats, geese, and fowls.

The arable portion of an estate was generally situated nearest to the dwelling-house as a matter of convenience. It produced but a small portion of what it was capable of doing under a better system of cultivation, but still sufficient to supply corn for bread; and after this article of primary necessity had been provided for, there remained grain for the purpose of making their favourite drink. Their bread was made of barley as well as wheat.

The use of marl as a manure had been known in Britain under the Romans, and a marl-pit is alluded to in an old Anglo-Saxon conveyance; but the successful application of manures is only of modern introduction in British agriculture. The state of cultivation in some parts of Scotland before the Union may, perhaps, be taken as an illustration of its condition in England before the Conquest. The lands which were kept manured did not amount to a third or a fourth part of the whole farm, and sometimes did not equal

* Turner's Anglo-Saxons, ii. 547 (5th edit.).

† The word *bacon* is said to have been applied to the flesh of the swine, from this custom of feeding the animal on beech-mast, the ancient name of which was *bucon*.—Verstegan's Restitution of Decayed Intelligence, p. 331.

a fifth or a sixth. The remainder was cultivated when that part of the farm which had been for some time arable was exhausted of its natural fertility.* A great breadth of land was required to supply the wants of a small number of consumers, as the relative quantity of produce was small, though at the same time the labour and cost of cultivation were proportionably low. Famines were frequent; but these were a consequence of imperfect social relations, the want of intercourse which prevented men from being mutually acquainted with each other's wants, the non-existence of a class of individuals who busied themselves in attending to the means for obviating these events, as well as to an imperfect state of agriculture. The Saxon Chronicle mentions several of these periodical visitations. In 793 a great famine took place. In 975, to use the expressive words of the Chronicler, "famine scoured the hills." In 976 it is briefly stated that "this year was the great famine in England; so severe that no man ere remembered such." In 1040 "rose the sester of wheat to fifty-five pence, and even farther." In 1044 the following notice occurs:—"This year there was very great hunger all over England, and corn so dear as no man ever remembered before; so that the sester of wheat rose to sixty pence, and even further."

* Smith's Wealth of Nations, book i. chap. ii.

In the Anglo-Saxon times, as in every country

Ploughing, Sowing, and carrying Corn. Harleian MS., 603.

in which agriculture is not in an advanced condition, seed-time and harvest were almost the only seasons of exertion. There was not room for that continuous labour which is required when a great number of intermediate operations are practised; but the division of employments existed to some extent, and on a considerable estate the services of the hinds were carried on under the eye of a steward or bailiff. The duties of the cowherd were distinct from those of the ploughman. The latter went out to his labours at day-break, attended by a boy to drive the oxen. Four oxen usually, but sometimes fewer,

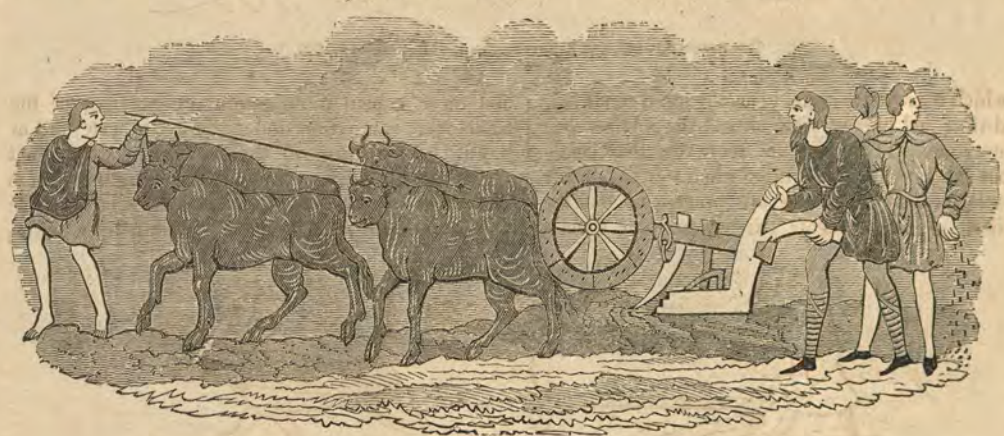
Wheel-Plough. From the Bayeux Tapestry.

were yoked to the plough. When the cattle were not turned out, as was the case in the winter, the ploughman attended to the feeding and watering of the oxen in the stable; but in the summer season they were committed to the care of the cowherd at the close of the day's labour, and were driven by him to the meadows, and, for fear of thieves, he attended them during the night, and in the morning drove them to the plough. Horses were not employed in field labour, but only oxen, the use of horses being prohibited. We have some account, also, of the occupation of the shepherd.

COSTUME OF SHEPHERDS. Cotton MS. Nero, C. 4.

Lest his flock should be attacked by wolves, he watched over its safety, attended by his dogs. The sheep were folded, and the folds were at times changed. Twice a-day the ewes were milked, and the cheese and butter were prepared by the shepherd. The swineherd was an occupation as necessary as any of the above. An Anglo-Saxon manuscript* contains a series of sketches representing the operations of husbandry during each month in the year. In January the ploughman is pursuing his labours. The plough, drawn by four oxen, which are attended by a driver, is provided with an iron coulter and share, and has

* Cotton MS. Tiberius, B. 5.



TWO-HANDED WHEEL-PLOUGH, DRAWN BY FOUR OXEN. Saxon Calendar, Cotton MS. Tib. B. 5.

a wheel attached to the end of the beam. The ropes by which the oxen are attached were made of twisted willows, and sometimes, it appears, of the skins of whales;* and this is certainly better than the practice prevailing in the Hebrides not longer ago than 1811, which dispensed with harness altogether, the horse's tail being fastened to the harrow by a rope made of hair.* In the manuscript alluded to the seed is scattered by a man who follows close to the ploughman, and it is at once deposited in the newly-made furrow. The Bayeux tapestry, however, shows that, in Normandy harrows were used; and there can be little

doubt that, at the same period, they were employed in England, though in the ninth century agriculture may have been practised in so loose and slovenly a manner as to omit their use altogether. The plough-beetle, in the hand of the ploughman above represented, used for breaking clods of earth, is mentioned in the list of 'husbandry furniture' by Tusser. It had not wholly gone out of use in some parts of the country so early as twenty-five years ago. In February the husbandmen are engaged in trimming plants, some of which resemble vines, and in loosening the earth around their roots. In March, one man is digging, another is sowing, and a third is using a pickaxe. Their labours seem to relate to the garden rather than the field. In April, the labours of seed-time being over, the landowner or occupier is regaling his friends, two of whom, who are seated beside him, are engaged in drinking out of horns. In May he goes into the fields to examine his flock previous to the time of shearing. In June the reapers are cutting down the corn.*

* Mr. Strutt supposes the illuminator to have here, by mistake, transposed the illustrations for June and July.

REAPING AND CARTING CORN. Cotton MS. Tib. B. 5.

It is bound into sheaves, and put into a cart for conveyance to the barn or stack. One man is represented as blowing a horn, perhaps for the purpose of enlivening the labours of the reapers. In July the husbandmen are in the woods felling and trimming the trees. In August the barley is cut: it is mown as in the present day. In September, the harvest being finished, the lord and his

Mowing. Cotton MS. Tib. B. 5.

attendants are hunting the wild boar; and in October they are pursuing the diversion of hawking. In November the husbandmen are engaged around a large fire repairing their implements. In December they are employed in threshing out the grain, which is winnowed or sifted, and carried out in

Threshing and Winnowing Corn. Cotton MS. Tib. B. 5.

PLOUGHING, SOWING, MOWING, GLEANING, MEASURING CORN, AND HARVEST SUPPER. Harleian MS. 603.

large baskets to the granary; an overseer or steward taking an account of the quantity by notches cut on a tally.

From these notices some idea may be obtained of the general nature of their field labours. The lands belonging to the church were generally in the best state of cultivation, and exhibited the application of a more intelligent system than those belonging to other landowners. On the church property the woods were better cleared, and the quantity of waste land was smaller. The monks themselves engaged in the labours of the field. Bede, in his Life of the Abbots of Wearmouth, tells us that one of these ecclesiastics, "being a strong man, and of a humble disposition, used to assist his monks in their several labours, sometimes guiding the plough by its stilt or handle, and sometimes forging instruments of husbandry with a hammer upon an anvil." One of the customs of modern tenancy—the principle of which is now carried out still further—existed at this period, viz., that the land should be left in a proper condition on its being given up. Thus, the holder of twenty hides of land was required to leave twelve hides of it sown for the advantage of the succeeding occupant. The implements of husbandry were ploughs, scythes, sickles, spades, axes, pruning-hooks, forks, and flails; and they had also carts and waggons.

PRUNING TREES. Cotton MS. Julius, A. 6.

The gardens and orchards attached to the monasteries are mentioned at an early period of Anglo-Saxon history. They produced figs, grapes, nuts, almonds, pears, and apples. The monks did not neglect ornamental planting, and planted herbs and shrubs around the monasteries as well as fruit-trees. The cultivation of the vine had been introduced by the Romans; and the county of Gloucester, according to William of Malmesbury, was famous for the excellence of its grapes. The management of bees must also have been an object of considerable importance.

Raising Water from a Well with a Loaded Lever.
Cotton MS. Nero, C. 4.

An account of the productions raised from the soil by the agriculturist necessarily affords considerable insight into the diet in general use. Cattle, sheep, and swine were numerous; and, therefore, meat was a common article of food. They also reared poultry; and ten geese and twenty hen fowls are mentioned among the articles to be supplied to the lord of the manor by the occupier of a certain quantity of land. Milk, cheese, and eggs were allowed on fast-days. Broth and soups were made, flavoured and seasoned with herbs. Barley-bread, being cheaper, was consumed by a greater number of persons than that made from wheaten flour. The peasant baked his own bread, sometimes probably in an oven, sometimes by toasting, sometimes on a heated plate of iron, placed over the fire. The baker carried on his art in the towns, and in the monasteries it was the business of a particular individual. At the commencement of the Anglo-Saxon period hand-mills were common, but the establishment of water-mills and windmills had become general towards its close. Cases occur in which several hundred loaves are paid as a portion of the rent of land. We find an instance of a poor monastery in which the monks could not afford to eat wheaten bread, but were obliged to confine themselves to that made from barley. The monastic establishments were sometimes so poor, at an early period, that even a cheaper food was resorted to than barley-bread. Land is mentioned as being given to one monastery, in order to furnish salt, beans, and honey. The latter article was held in much esteem, and continued to be so until the discovery of the tropical regions of the west afforded sugar from vegetable productions. Herbs, eggs, fish, cheese, butter, and beans, with meat, constituted the diet of children. The spices of eastern countries found their way overland, and small quantities were offered as acceptable presents from one person of distinction to another. The want of green food in winter rendered it necessary to provide a supply of salt meat sufficient to last until the pastures again furnished the cattle with nutritive grasses. The manufacture of salt was conducted by a separate class of men; and in grants and conveyances, vessels for the boiling of salt, wood sufficient to boil salt, and the utensils used, are mentioned. Horse-flesh, which had been eaten by the ancient Saxons, was not rejected by those of Britain until some time after their conversion to Christianity; but in the eighth century this practice was discouraged, and as it had been declining since the time of Egbert, there can be no doubt but that it soon entirely ceased. Of fish, eels, being caught with the greatest ease, were more common as food than other descriptions. They were received in payment of rent, and also offered as presents to the monasteries. Two portions of land, purchased for twenty-one pounds, bring a rent of 16,000 fish annually. Salt-water fish could only have been conveyed far from the coast at a disproportionate cost; and the country being undrained, the meres, brooks, and ditches offered a receptacle for those which reside in fresh water; and thus the proportion of the latter which would be eaten as food, would probably exceed the consumption of salt-water fish. The fitting out a boat, and providing materials for sea-fishing involved an expense which the limited extent of the market might not justify, except in the vicinity of the most populous places. Fish were taken both by the rod and in nets; and amongst those which were an object of pursuit were eels, eel-pouts, lampreys, skates, flounders, plaice, haddocks, herrings, salmon, sturgeon, minnows, porpoises, oysters, cockles, crabs, lobsters, mussels, and winkles. The serfs who were employed as fishermen were conveyed to a purchaser along with the fishery, when the latter was sold. They formed a separate class. The people on the coast of Sussex, who are now the most expert fishermen in the British Channel, were, as we have already had occasion to notice, unable to avail themselves of the riches by which they were surrounded until after the middle of the seventh century.

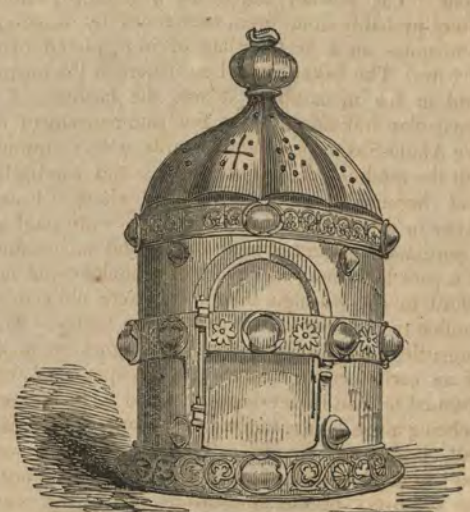
Henry of Huntingdon relates that the Anglo-Saxon kings were "so generous and bountiful, that they commanded four royal banquets to be served up every day to all their courtiers; choosing rather to have much superfluity at their tables than the least deficiency." They were, in common with other northern nations, as much devoted to drinking as to the substantial bounties of the table. Their most common drink was ale, prepared as now, from malted barley; and allusions are made in old manuscripts to three descriptions or qualities, viz., mild ale, clear ale, and Welsh ale. Ale-houses seem to have been established, as priests were forbidden to frequent the "wine-tuns;" and

DRINKING FROM COWS' HORNS. Cotton MS. Claud. B. 4.

other liquors as well as ale were perhaps sold at these places. Mead was, if not more highly prized, at least more costly than ale; and it was the favourite beverage of the Welsh. Honey, which is the chief ingredient, generally formed a portion of the rent paid in kind; and in some cases the liquor itself already prepared was required. In case this part of the agreement could not be fulfilled to the letter, the payment was commuted, and two casks of spiced ale, or four casks of common ale, were received in lieu of one cask of mead. A liquor called morat was made of honey, flavoured with the juice of mulberries. Pigment was a sweet liquor, or perhaps cordial composed of honey, wine and spices. Wine was expressed from the grape by means of a wine-press, but it does not seem to have been a common drink, and it is not mentioned in the laws of Wales. None but the wealthy, we may suppose, could indulge in these luxuries.

WINE-PRESS. Cotton MS. Claud. B. 4.

The comfort even of the best furnished dwelling-houses would have been very incomplete without an abundant supply of fuel, which was obtained from a portion of each estate set apart for the growth of wood for burning and building. Turf also appears to have been in use, and probably coal. In a lease examined by Mr. Turner, the conditions on which it was granted are, the yearly payment of sixty fother of wood, six fother of turf, and twelve fother of græfan, which he is of opinion may mean coal. In another lease, amongst the articles mentioned are, five waggons full of good twigs, and every year an oak for building, and others for necessary fires, and sufficient wood for burning; and in one grant is included also wood sufficient to boil salt. Candles made of wax were used in the palace of Alfred, as appears from the story we have related in a preceding chapter, of the contrivance by which he made them serve the purpose of marking the lapse of time, as well as giving light. If this story be correct, we must attribute to Alfred the invention of lanterns; and they



SAXON LANTERN. Engraved in Strutt's Chronicle of England.

seem afterwards to have come into common use, and, from the representations of them found in the illuminated manuscripts, to have been sometimes highly ornamented. Candlesticks of bone were used; but we also find that silver candelabra were in use.

Candelabra. Harleian MS. 603.

The materials used for clothing were, to a great extent, the produce of household industry. The female domestics were employed in spinning and sewing, and there were under each landowner serfs who were trained to the practice of the most necessary mechanical arts. The most skilful artificers were attached to the monasteries, and there also were to be found those who were proficients in the superior departments of art; such as architects, illuminators, and workers in gold and silver, as well as carpenters, smiths, shoemakers, millers, bakers, and farming-servants. Females of the highest rank did not disdain the labours of the distaff, the loom, and the needle. The daughters of Edward the Elder were taught to occupy themselves in this manner; and Alfred, in his will, terms the female part of his family the spindle side. The word spinster, applied in the present day to unmarried females, had its origin in an age when the distaff really occupied a large portion of their time. At the same time the art of weaving was sufficiently advanced to give variety to the fabric, whether of linen or woollen, by the introduction of different colours. A robe belonging to Aldhelm was purple, and, within black circles, were worked figures of the peacock. A love of gaudy colours is a natural characteristic of a comparatively rude age, and several recorded facts show that the Anglo-

Saxon mind was deeply imbued with this taste. Bede states that, in St. Cuthbert's monastery, the clothing of the monks was made of the natural wool, and not dyed; but this monastic rule may be regarded only as an instance of what was conceived an act of mortification; and Aldhelm, in a simile in one of his homilies, gives us more information on this point, and also on the art of weaving, than we derive from any treatise professedly on these subjects. The virtue which he is panegyrising does not, he observes, alone constitute a perfect character; and he sustains his argument by stating

that "it is not a web of one uniform colour and texture, without any variety of figures, that pleaseth the eye and appears beautiful, but one that is woven by shuttles, filled with threads of purple, and many other colours, flying from side to side, and forming a variety of figures and images, in different compartments, with admirable art." This was written towards the close of the seventh century. In an illuminated manuscripts the robes of the four Evangelists exhibit the following colours:—yellow, green, pea-green, purple, blue, red, lilac. The art of dyeing was doubtless in great request, but we possess no accounts concerning the substances which were used. The art of obtaining a scarlet dye from an insect of the cochineal species was discovered about the close of the tenth century.* Silk was worn only by the most wealthy. The common materials of wearing apparel were linen and woollen. Several articles of dress were derived from the art of the tanner, who seems to have afterwards worked up the leather he had tanned into shoes, ankle leathers, and leathern hose, and to have also made a variety of things which are now obtained from the hands of the saddler and harness-maker, such as bridle thongs, trappings, halters, and leather neck-pieces; as well as bottles, wallets, pouches, flasks, and boiling-vessels. The variety of articles which one class of men were required to make illustrates the imperfect division of employments which existed. The art of tanning skins with the wool or hair on was also practised. The skins of martens, as we have seen, were imported, but a bishop is mentioned who never made use of other fur in lining his garments than lambs' skins. Cats' skins were also used.

Anglo-Saxon times. They demand considerable skill, and are therefore among the first to become separated from other occupations. The implements of the blacksmith were the bellows, anvil, hammer, and tongs. The number of smiths' forges in the city of Gloucester, in the time of Edward the Confessor, was six. Iron ore was obtained in several counties, and there were furnaces for smelting. The mines of Gloucestershire in particular are alluded to by Giraldus Cambrensis as producing an abundance of this valuable metal;* and there is every reason for supposing that these mines were wrought by the Saxons, as indeed they had most probably been by their predecessors the Romans. The lead-mines of Derbyshire, which had been worked by the

* Itin. Cambriæ, lib. i. c. 5.

Romans, furnished the Anglo-Saxons with a supply of ore; but the most important use of this metal in the Anglo-Saxon period—that of covering the roofs of churches—was not introduced before the close of the seventh century.* The ecclesiastics were the most skilful workers in metal, but none were more famous than Dunstan. Edgar had commanded that every priest, "to increase knowledge, should diligently learn some handicraft;" and the wants of the age rendered a compliance with his directions a matter of convenience to the priests themselves, for there did not exist a class of native artificers capable of executing in a superior manner the ornaments for the churches. Bells, images, and crucifixes are among the articles on which their skill was exercised. No vessel made of horn or wood was used in the various offices of the church. Precious stones were inserted in their works of silver and gold, to add to their value and beauty. Gold and silver cups, gold dishes, silver basons gilt, gold rings, silver mirrors, and bracelets, are among the articles of this description, the manufacture of which is mentioned. The art of gilding was known, and gold and silver thread was made. The art of the coppersmith was also called into requisition. The carpenter was called the treow-wyrhta, that is, the tree or wood-worker. Carts, waggons, ploughs, and other implements of agriculture, were constructed by his art, as well as articles of household furniture. The machinery for their corn-mills, though rude, would call into exercise the abilities of the most skilful of this class of artificers. Their services appear also to have been required in making other four-wheeled carriages besides those required for agricultural purposes. These were doubtless constructed with as much elegance as the workman was capable of giving to his work. The body was formed of some flexible material, probably leather, and was slung like a hammock. It could not apparently contain more than one person, who must have reclined as in a palanquin. Shipbuilding, after the incursions of the Danes directed attention to its revival, was also a most important department of the useful arts. The head of a royal vessel was wrought with gold; the deck was gilded, and the sails were purple. That the useful arts were held in much esteem at a time when they were practised by a comparatively small number of individuals may be readily imagined, as the advantages which they conferred would be the more obvious and striking on this account. The office of king's chief smith was one of considerable dignity. In the court of the kings of Wales his place at table was next to that of the king's chaplain. There were, however, two classes of smiths, those who forged arms and weapons for military purposes, and others who were employed in fabricating the more humble implements of agriculture and articles required for the daily purposes of life; and unhappily the former would enjoy the honours which were due to their more useful brethren.

The above arts may all be considered as of native origin, since they were practised, in however rude a state, from the earliest period. But the art of making glass was not indigenous. In the seventh century the Anglo-Saxons are described by Bede as being "ignorant and helpless" in the manufacture of glass. At that period, however, persons acquainted with the art were brought over from France by Benedict Biscop, the founder of the Abbey of Wearmouth, for the purpose of glazing the windows of his monastery. Our ancestors were initiated into the process by these artificers, and windows and drinking vessels of glass, though they did not become common, were still within reach of the affluent.

CHAPTER V.

THE HISTORY OF LITERATURE, SCIENCE, AND THE FINE ARTS.

THE space of about a thousand years, extending from the overthrow of the Western Roman empire, in the middle of the fifth century, to that of the Eastern, in the middle of the fifteenth, may be divided into two nearly equal parts; the first of which may be considered as that of the gradual decline, the second as that of the gradual revival of letters. The first of these periods, coming down to the close of the tenth century, nearly corresponds with that of the Saxon domination in England. In Europe generally throughout this long space of time we perceive the intellectual darkness, notwithstanding some brief and partial revivals, deepening more and more on the whole, as in the natural day the grey of evening passes into the gloom of midnight. The Latin learning, properly so called, may be regarded as terminating with Boethius, who wrote in the early part of the sixth century. The Latin language, however, continued for some time longer to be used in literary compositions, both in our own country and in the other parts of Europe that had composed the old empire of Rome.

Of the early British and Irish authors, some of whose works still remain, we have already made mention of the two famous heretics, Pelagius and his disciple Celestius, who flourished in the fourth century. To the next century belong the great Apostle of the Irish, St. Patrick, from whose pen we have the composition styled his Confession; his friend and fellow-labourer the Irish Bishop Secundinus, by whom there is extant a Latin poem in praise of St. Patrick; and the poet Sedulius, or Shiel, who, although an Irishman by birth, appears to have resided on the continent, and whose various works have been repeatedly printed.* All these wrote only in Latin, although St. Patrick, in his Confession, apologizes for the rudeness of phrase with which he expressed himself in that language, owing to his long habit of speaking Irish.

Gildas, our earliest historian, also wrote in Latin. St. Gildas the Wise, as he is styled, was a son of Caw, Prince of Strathclyde, in the capital of which kingdom, the town of Alcluyd, now Dunbarton, he was born, about the end of the fifth or beginning of the sixth century. Caw was also the father of the famous bard Aneurin. In his youth, Gildas is recorded to have gone over to Ireland, and to have studied in the schools of the old national learning that still flourished there; and like his brother Aneurin, he also commenced his career as a bard, or composer of poetry in his native tongue. He afterwards, however, was converted to Christianity, and became a zealous preacher of his new religion. The greater part of his life he appears to have spent in his native island; but he at last retired to Armorica, or Little Britain, on the continent, and died there. He is said to lie buried in the cathedral of Vannes.* He is the author of two declamatory effusions—the one entitled a 'History of the Britons,' the other an 'Epistle to the Tyrants of Britain,' which have been often printed. They consist principally of violent invectives directed both against the Saxons and the author's own countrymen; but they also contain a few historical notices respecting the obscure period to which they relate that are of some value.

The immediate successor of Gildas among our historians is Nennius, said to have been one of the monks of Bangor, from the massacre of whom in 613 he escaped, and to have written his History of the Britons a few years afterwards. His native name is supposed to have been Ninian, and he was, like Gildas, of Welsh or Cumbrian origin. But there is much obscurity and confusion in the accounts we have of Nennius; and it appears to be most probable that there were at least two early historical writers of that name. The author of 'Britannia after the Romans,' who has bestowed considerable pains in investigating the subject, supposes that the true work of the ancient Nennius only came down to the invasion of Julius Cæsar, and is now lost, although we probably have an abridgment of it in the work published under the name of Nennius, by Gale, in the first volume of the 'Historiæ Britannicæ, Saxonicæ, Anglo-Danicæ Scriptores Quindecim' (fol. Oxon. 1691), and commonly referred to as his British History. That performance is stated in the preface by the author himself to have been written in the year 858.†

Contemporary with the original Nennius was the Irish Saint Columbanus, distinguished for his missionary labours among the Gauls and Germans. Columbanus died in 615, at the monastery of

* See an article on Sedulius in Bayle

* Britannia after the Romans, pp. xiv.—xx., and 175-180.

† Ibid. pp. 21, 22.

Bobbio, in northern Italy, of which he was the founder. "The writings of this eminent man that have come down to us," observes Mr. Moore, "display an extensive and various acquaintance, not merely with ecclesiastical, but with classical literature. From a passage in his letter to Boniface, it appears that he was acquainted both with the Greek and Hebrew languages; and when it is recollected that he did not leave Ireland till he was nearly fifty years of age, and that his life afterwards was one of constant activity and adventure, the conclusion is obvious, that all this knowledge of elegant literature must have been acquired in the schools of his own country. Such a result from a purely Irish education, in the middle of the sixth century, is, it must be owned, not a little remarkable. Among his extant works are some Latin poems, which, though not admissible of course to the honours of comparison with any of the writings of a classic age, shine out in this twilight period of Latin literature with no ordinary distinction." * Another learned Irishman of this age was St. Cummian, the author of an epistle, still extant, addressed to Segienus, abbot of Iona, in defence of the Roman mode of computing Easter, in which he shows a very extensive acquaintance both with the subject of chronology and with the works of the fathers, Greek as well as Latin. "The various learning, indeed," says the writer we have just quoted, "which this curious tract displays, implies such a facility and range of access to books, as proves the libraries of the Irish students, at that period, to have been, for the times in which they lived, extraordinarily well furnished." † To the Irish scholarship of this age may also be regarded as belonging the two Latin lives of Columba; the first by Cuminius, who succeeded him as abbot of Iona in 657; the second, which is of much greater length, by Adomnan, who succeeded Cuminius in the same office in 679. Both these productions, the second of which in particular is highly curious, have been printed. Their authors, although they resided in one of the North British islands, were probably Irishmen by birth. The school of Iona was at least an Irish foundation.

Of the Latin writers among the Anglo-Saxons the most ancient is Aldhelm, abbot of Malmesbury, and afterwards bishop of Sherborn, who died in 709, and has left various writings both in prose and verse. Aldhelm received his education in part from an Italian monk named Adrian, who had come over to England with Archbishop Theodore, but chiefly from Mailduff, an Irishman, the founder of the monastery of Malmesbury, by whom he tells us he was thoroughly instructed both in Latin and Greek. Among the studies of his after-life, he mentions the Roman law, the rules of Latin prosody, arithmetic, astronomy, and astrology. He also wrote a tract on the great scientific question of the age—the proper method of computing Easter. But Aldhelm's favourite subject seems to have been the virtue of virginity, in praise of which he wrote first a copious treatise in prose, and then a long poem. Both these performances have been printed. Aldhelm long enjoyed the highest reputation for learning; but his writings are chiefly remarkable for their elaborately unnatural and fantastic rhetoric. His Latin style bears a strong resemblance to the pedantic English, full of alliteration and all sorts of barbarous quaintness, that was fashionable among our English theological writers in the reigns of Elizabeth and James I.

But the Anglo-Saxon name most distinguished in literature is that of Beda, or Bede, upon whom the epithet of the "Venerable" has been justly bestowed by the respect and gratitude of posterity. All that Bede has written, like the other works already mentioned, is in Latin. He was born some time between the years 672 and 677, at Jarrow, a village near the mouth of the Tyne, in the county of Durham, and was educated in the neighbouring monastery of Wearmouth, under its successive abbots Benedict and Ceolfrid. He resided here, as he tells us himself, from the age of seven to that of twelve, during which time he applied himself with all diligence, he says, to the meditation of the Scriptures, the observance of regular discipline, and the daily practice of singing in the church. "It was always sweet to me," he adds, "to learn, to teach, and to write." In his nineteenth year he took deacon's orders, and in his thirtieth he was ordained priest. From this date till his death, in 735, he remained in his monastery, giving up his whole time to study and writing. His chief task was the composition of his celebrated Ecclesiastical History of England, which he brought to a close in his fifty-ninth year. It is our chief original authority for the earlier portion even of the civil history of the Anglo-Saxons. But Bede also wrote many other works, among which he has himself enumerated, in the brief account he gives of his life, at the end of his Ecclesiastical History, which has just been quoted, Commentaries on most of the books of the Old and New Testaments and the Apocrypha, two books of Homilies, a Martyrology, a chronological treatise entitled 'On the Six Ages,' a book on orthography, a book on the metrical art, and various other theological and biographical treatises. He also composed a book of hymns and another of epigrams. Most of these writings have been preserved, and have been repeatedly printed. The first edition of the Ecclesiastical History appeared at Esling, in Germany, in 1474; and there are three continental editions of the entire works of Bede, each in eight volumes folio, the latest of which was published at Cologne, in 1688. Some additional pieces were published at London in a quarto volume, by Mr. Wharton, in 1693. It appears also, from an interesting account of Bede's last hours, by his pupil, St. Cuthbert, that he was engaged at the time of his death in translating St. John's Gospel into his native tongue. Among his last utterances to his affectionate disciples watching around his bed, were some recitations in the

* History of Ireland, i. 267. † Ibid. 273.

JARROW, at the Mouth of the River Tyne. The Birth-place and Residence of Bede.

English language: "For," says the account, "he was very learned in our songs; and putting his thoughts into English verse, he spoke it with compunction."

Another celebrated Anglo-Saxon churchman of this age was St. Boniface, originally named Winfrith, who was born in Devonshire about the year 680. Boniface is acknowledged as the Apostle of Germany, in which country he founded various monasteries, and was greatly instrumental in the diffusion both of Christianity and of civilization. He eventually became archbishop of Mentz, and was killed in East Friesland by a band of heathens in 755. Many of his letters to the popes, to the English bishops, to the kings of France, and to the various Anglo-Saxon kings, still remain, and are printed in the Magna Bibliotheca Patrum. We may here also mention another contemporary of Bede's—Eddius, surnamed Stephanus, the author of the Latin life of Bishop Wilfrid. Bede mentions him as the first person who taught singing in the churches of Northumberland.

But at this time, and down to a considerably later date, as we have already had occasion to observe, the chief seat of learning in Europe was Ireland; and the most distinguished scholars who appeared in other countries were either Irishmen, or had received their education in Irish schools. We are informed by Bede, that it was customary for the English of all ranks, from the highest to the lowest, to retire for study and devotion to Ireland, where, he adds, they were all hospitably received, and supplied gratuitously with food, with books, and with instruction.* His contemporary, Aldhelm, in a passage in which he labours to exalt the credit of the English scholars, and especially of his patrons, Theodore and Adrian, yet admits that those of Ireland enjoyed the higher reputation, and bears distinct, though reluctant testimony to the crowded attendance of her schools. "Why should Ireland," he exclaims, "whither troops of students are daily transported, boast of such unspeakable excellence, as if in the rich soil of England Greek and Roman masters were not to be had to unlock the treasures of divine knowledge? Though Ireland, rich and blooming in scholars, is adorned like the poles of the world with innumerable bright stars, it is Britain has her radiant sun, her sovereign pontiff Theodore."† It was during the eighth and the early part of the ninth century that the Irish scholars made the most distinguished figure in foreign countries. Virgilius, the bishop of Saltzburgh, famous for his assertion of the existence of antipodes, for which he was denounced as a heretic by his British contemporary Boniface, but was not, as is commonly said, deposed by Pope Zachary, his elevation to the bishopric having, on the contrary, taken place some years afterwards, was an Irishman, his native name having been probably Feargil, or Feargal. He died in 784. Of the learned persons who were attached to the court of France in this age by the munificent pa-

* Hist. Eccles. iii. 28.
† Translated in Moore's Hist. of Ireland, i. 299.

tronage of Charlemagne, the most eminent were Irish. Such, by birth, at least, Alcuin himself, the chief ornament of the imperial court, appears to have been, the oldest accounts designating him a Scot, although he has himself told us that he received his education at York. Alcuin was appointed by Charlemagne to preside over the seminary established by that emperor out of which the University of Paris is regarded as having grown. At the same time, his friend and fellow-countryman, Clement, was set over a similar institution in Italy. Somewhat later, we find another eminent Irishman, named Dungal, selected by the Emperor Lothaire I., the grandson of Charlemagne, to superintend the whole system of the Italian universities or public schools. He governed that of Pavia in person; but he is stated to have founded and exercised a general control also over those of Ivrea, of Torino, of Ferno, of Verona, of Vicenza, and of Cividad del Friuli. Dungal has left various works, which bear honourable testimony both to his scientific and his literary acquirements. A second Irish Sedulius, the author of a prose Commentary on the Epistles of St. Paul, also appears to have flourished in the early part of the ninth century. He became bishop of Oreto in Spain; and besides his Commentary, is the author of a treatise entitled 'The Concordance of Spain and Hibernia;' in which he not only maintains the Irish to be Spaniards by origin, but asserts their right to be still considered as merely a division of the Spanish nation. Donatus, who was about the same time bishop of Fiesole, in Italy, was also an Irishman. The only piece of his that remains is a short Latin poem in praise of his native country.*

But the glory of this age of Irish scholarship and genius is the celebrated Joannes Scotus, or Erigena, as he is as frequently designated,—either appellative equally proclaiming his true birth-place. He is supposed to have first made his appearance in France about the year 845, and to have remained in that country till his death, which appears to have taken place before 875. Erigena is the author of a translation from the Greek of certain mystical works ascribed to Dionysius the Areopagite, which he executed at the command of his patron, the French king, Charles the Bald, and also of several original treatises on metaphysics and theology. His productions may be taken as furnishing clear and conclusive evidence that the Greek language was taught at this time in the Irish schools. Mr. Turner has given a short account of his principal work, his Dialogue de Divisione Naturæ (On the Division of Nature), which he characterises as "distinguished for its Aristotelian acuteness and extensive information." In one place "he takes occasion," it is observed, "to give concise and able definitions of the seven liberal arts, and to express his opinion on the composition of things. In another part he inserts a very elaborate discussion on arithmetic, which he says he had learnt from his infancy. He also details a curious conversation on the elements of things, on the motions of the heavenly bodies, and other topics of astronomy and physiology. Among these he even gives the means of calculating the diameters of the lunar and solar circles. Besides the fathers Austin, the two Gregories, Chrysostom, Basil, Epiphanius, Origen, Jerome, and Ambrosius, of whose works, with the Platonising Dionysius and Maximus, he gives large extracts; he also quotes Virgil, Cicero, Aristotle, Pliny, Plato, and Boethius; he details the opinions of Eratosthenes and of Pythagoras on some astronomical topics; he also cites Martianus Capella. His knowledge of Greek appears almost in every page."* The subtle speculations of Erigena have strongly attracted the notice of the most eminent among the modern inquirers into the history of opinion and of civilization; and the German Tenneman agrees with the French Cousin and Guizot in attributing to them a very extraordinary influence on the philosophy of his own and of succeeding times. To his writings and translations it is thought may be traced the introduction into the theology and metaphysics of Europe of the later Platonism of the Alexandrian school. It is remarkable, as Mr. Moore has observed, that the learned Mosheim had previously shown the study of the scholastic or Aristotelian philosophy to have been also of Irish origin. "That the Hibernians," says that writer, "who were called Scots in this (the eighth) century, were lovers of learning, and distinguished themselves in these times of ignorance by the culture of the sciences beyond all the other European nations, travelling through the most distant lands, both with a view to improve and to communicate their knowledge, is a fact with which I have been long acquainted; as we see them in the most authentic records of antiquity discharging, with the highest reputation and applause, the function of doctor in France, Germany, and Italy, both during this and the following century. But that these Hibernians were the first teachers of the scholastic theology in Europe, and so early as the eighth century illustrated the doctrines of religion by the principles of philosophy, I learned but lately." † And then he adduces the proofs that establish his position.

We now proceed to give some account of the Anglo-Saxon language and literature.

The Anglo-Saxon language is one of the dialects of the ancient Gothic, which prevailed over all the countries of Europe designated as barbarous by the Greeks and Romans, except those in which the Celtic and Sclavonian were spoken. The three immediate descendant languages from the Gothic were the Anglo-Saxon, the Franco-Theotisc, and the old Icelandic. From the Anglo-Saxon the English, and probably also the Lowland Scotch, are descended; from the Francic, the German, and the Dutch; from the old Icelandic, the Swedish, the Danish, the Norwegian, and the modern Icelandic. Of the Gothic itself but a single monument remains, an imperfect copy of

* Translated from Moore's Hist. of Ireland, p. 300.

* Turner, Anglo-Sax. iii. 393. † Moore's Ireland, i. 302.

the Gospels, preserved in the library at Upsala in Sweden. From the silver with which the characters in it are adorned, it has long been called the *Codex Argenteus*, or silver book; and it is believed to be a portion of the Gothic Bible, all, or the greater part of which was translated by Ulphilas, bishop of the Mœsian Goths, who lived under the Emperor Valens, about the year 360, and who is supposed to have invented or applied an alphabet, formed from the Greek and Latin, to his translation.

What was the form of the Saxon language when Hengist and Horsa entered Britain, in 449, it is impossible to discover. The Saxons were evidently at that time a people without learning, and there is every probability that they were without an alphabet. Till after the arrival of St. Austin we have no monument of their literature. A passage in Bede, which is copied in the Saxon Chronicle, under the year just named, points out the tribes who in the two centuries which followed Hengist's and Horsa's invasion were called in to complete the Saxon domination. "Then came the men from three powers of Germany; the Old Saxons, the Angles, and the Jutes. From the Jutes are descended the inhabitants of Kent and the Wightware, that is, the race that now dwells in Wight, and that tribe among the West Saxons which is still called the Jute tribe. From the Old Saxons came the East Saxons, the South Saxons, and the West Saxons. From the Angles' land, which has ever since stood waste between the Jutes and the Saxons, came the East Angles, the Mercians, the Northumbrians, and also the other nations of England." Raske, in the preface to his Grammar, in conformity to this passage, considers the Anglo-Saxon language, in its origin, to have been a rude mixture of the dialects of these three people; which, in the progress of time, melted into one language, just as the kindred tribes themselves united to form one nation after they had taken possession of England.

Dr. Hickes and other philologists have divided the Saxon language as spoken in England into three dialects: the first, that in use from the arrival of the Saxons till the irruption of the Danes—a period of 330 years—this they term the Anglo-Saxon; the second, which prevailed from the Danish to the Norman invasion, they call the Dano-Saxon; and the third, which was in fact beyond the limits of the tongue (which was then in a state of transition to the English), they call Normanno-Saxon, and extend it as low as the time of Henry II. But these were, in fact, merely successive stages of the language, not dialects. That a mixture of Danish might be found in the Northumbrian part of England is probable, as the Danes landed so frequently and in such numbers in that country, that they had mixed with the inhabitants; but we agree generally with Raske, that, at least in the Anglo-Saxon works hitherto printed, no clear traces are to be met with of anything that can properly be called a variation of dialect.

The Song of the elder Caedmon, "On the Origin of Things," preserved in Alfred's Translation of Bede's Ecclesiastical History is one of very few specimens now remaining of the Saxon of the earliest period.* It follows, with a literal translation in the opposite column:—

Nu we sceolan herian.	Now must we praise
Heofon-rices weard.	The guardian of heaven's kingdom,
Metodes mihte.	The Creator's might,
& his mod-gethone.	And his mind's thought;
Wera wuldor-fæder.	Glorious Father of men!
Swa he wundra gehwæs.	As of every wonder he,
Ece drihten.	Lord eternal,
Oord onstealde.	Formed the beginning.
He ærest gesceop.	He first framed
Eorthan bearnum.	For the children of earth
Heofon to hrofe.	The heaven as a roof;
Halig scyppend.	Holy Creator!
Tha middangeard.	Then mid-earth,
Moncynnes weard.	The Guardian of mankind,
Ece dryhten.	The eternal Lord,
Æfter teode.	Afterwards produced;
Firum foldan.	The earth for men,
Frea ælmihtig.	Lord Almighty!

The next specimen of Saxon which we shall give is a copy of the Lord's Prayer, written by Eadfrith, bishop of Lindisfarne, about the year 700: there is little in it that is unintelligible to an English reader. It is preserved in the ancient copy of the Gospels called the Durham Book:†—

Fader uren thu arth in heofnum sie gehalgud noma thin; to cymeth ric thin; sie willo thin suæls inheofne & in eortho; hlaf usenne ofer wistlic sel us todæg; & forgef us scylda usna suæ uæ forgefon scyldgum usum; & ne inlæd usih in costunge uh gefrig usich from yfle.

* Conybeare, Illust. p. 36, gives the year 670 as its date.

† MS. Cotton, Brit. Mus. Nero, D. iv.

Next in order of time, as a composition, we are perhaps to place the "Metrical Paraphrase of Parts of the Holy Scriptures," by a nameless author, but ascribed to a second Caedmon, which has recently been so ably edited by Mr. Benjamin Thorpe. The first portion of this poem, after an exordium of thanksgiving to the great Creator, relates the fall of a portion of the angelic host, and the design of the Deity to replenish the void thus occasioned in his creation by a better and a holier race. The fall of Man is next considered, ushered in by a repetition of the circumstances already introduced in the exordium, of the pride, rebellion, and punishment of Satan and his powers, and with a resemblance to Milton so remarkable, that, as Mr. Conybeare has observed, much of this portion might be almost literally translated by a cento of lines from that great poet. We shall produce a specimen or two, accompanied by Mr. Thorpe's version:—

Tha wearth se mihtiga gebolgen.	Then was the Mighty angry,
Hehsta heofones waldend.	The highest Ruler of heaven
Wearp hine of than hean stole.	Hurled him from the lofty seat;
Hete hæfde he æt his hearran gewunnen.	Hate had he gain'd at his Lord,
Hyld hæfde his ferlorene.	His favour he had lost,
Gram wearth him se goda on his mode.	Incensed with him was the Good in his mind.
Forthon he sceolde grund gesecan.	Therefore he must seek the gulf
Heardes helle-wites	Of hard hell-torment,
Thæs the he wann with heofnes waldend.	For that he had warr'd with heaven's Ruler.
Acwæth hine tha fram his hyldo.	He rejected him then from his favour,
And hine on helle wearp.	And cast him into hell,
On tha deowan dalas.	Into the deep parts,
Thær he to deofle wearth.	When he became a devil:
Se feond mid his geferum eallum.	The fiend with all his comrades
Feollon tha ufon of heofnum.	Fell then from heaven above,
Thurh longe swa threo niht & dagas.	Through as long as three nights and days,
Tha englas of heofnum on helle.	The angels from heaven into hell;
& heo alle forsceop drihten to deoflum.	And them all the Lord transformed to devils,
Forthon heo his dæd & word.	Because they his deed and word
Noldon weorthian.	Would not revere;
Forthon the heo on wyrse leoht.	Therefore them in a worse light,
Under eorthan neothan.	Under the earth beneath,
Ælmihtig god.	Almighty God
Sette sigelese.	Had placed triumphless
On tha sweartan helle.	In the swart hell;
Thær hæbbath heo on æfyn.	There they have at even,
Ungemet lange.	Immeasurably long,
Ealra feonda gehwilc.	Each of all the fiends,
Fyr-edneowe.	A renewal of fire;
Thonne cymth on uhtan.	Then cometh ere dawn
Easterne wind.	The eastern wind,
Forst fyrnum cald.	Frost bitter-cold,
Symble fyr oththe gar.	Ever fire or dart;
Sum heard geswinc.	Some hard torment
Habban sceoldon.	They must have,
Worhte man hit him to wite.	It was wrought for them in punishment,
Hyra woruld wæs gehwyrfed.	Their world-life was changed;
For man-sithe.	For their sinful course
Fylde helle.	He filled hell
Mid tham andsacum.	With the apostates.*
* * * * * * * * * * * *	
Hæfdon wite micel.	They had great torment;
Wæron tha befeallene.	Then were they fall'n
Fyre to botme.	To the fiery abyss,
On tha hatan hell.	Into the hot hell,
Thurh hygeleaste.	Through phrensy
& thurh ofermetto.	And through pride;
Sohton other land.	They sought another land,
That wæs leohtes leas.	That was void of light,
& wæs liges full.	And was full of flame,
Fyres fær micel	A great receptacle of fire.†
* * * * * * * * * * * *	
Satan mathelode.	Satan harangued,
Forgiende spræc.	Sorrowing spake,

* Thorpe's Caedmon's Paraphrase, p. 19. † Ibid. p. 21.

Sethe helle forth.
Healdan sceolde.
Gyman thæs grundes.
Wæs ær Godes engel.
Hwit on heofne.
Oth hine his hyge forspeon.
& his ofermetto.
Ealra swithost.
Thæt he ne wolde.
Wereda drihtnes.
Word wurthian.
Weoll him on innan.
Hyge ymb his heortan.
Hat wæs him utan.
Wrathlic wite.
He tha worde cwæth.
Is thes ænga stede ungelic swithe.
Tham othrum the we ær cuthon.
Hean on heofon-rice.
The me min hearra onlag.
Theah we hine for tham alwealdan.
Agan ne moston.
Romigan ures rices.
Næfth he theah riht gedon.
Thæt he us hæfth befylled.
Fyre to botme.
Helle thære hatan.
Heofon-rice benumen.
Hafath hit gemearcod.
Mid mon-cynne.
To gesettanne.
That me is sorga mæst.
That Adam sceal.
The wæs of eorthan geworht.
Minne stronglican.
Stol behealdan.
Wesan him on wynne.
& the this wite tholien.
Hearm on thisse helle.

He who hell thenceforth
Should rule,
Govern the abyss.
He was erst God's angel,
Fair in heaven,
Until him his mind urged,
And his pride
Most of all,
That he would not
The Lord of Hosts'
Word revere;
Boil'd within him
His thought about his heart,
Hot was without him
His dire punishment.
Then spake he the words,
'This narrow place is most unlike
That other that we ere knew,
High in heaven's kingdom,
Which my Master bestow'd on me,
Though we it, for the All-powerful,
May not possess,
Must cede our realm;
Yet hath he not done rightly
That he hath struck us down
To the fiery abyss
Of the hot hell,
Bereft us of heaven's kingdom,
Hath it decreed
With mankind
To people.
That of sorrows is to me the greatest,
That Adam shall,
Who of earth was wrought,
My strong
Seat possess,
Be to him in delight,
And we endure this torment,
Misery in this hell.*

The following is another passage from the same Paraphrase,—a part of the Song of Azariah:—

Tha of roderum wæs.
Engel ælbeorht.
Ufan onsended.
Wlite scyne wer.
On his wuldor-haman.
Se him cwom to frofre.
& to feorh-nere.
Mid lufan & mid lisse.
Se thone lig tosceaf.
Halig & heofon-beorht.
Hatan fyres.
Tosweop hine & toswende.
Thurh tha swithan miht.
Ligges leoma.
That hyra lice ne wæs.
Owiht geegled.
Ac he on andan sloh.
Fyr-on feondas.
For fyren-dædum.
Tha wæs on tham ofne.
Thær se engel becwom.
Windig & wynsum.
Wedere gelicost.
Thonne hit on sumeres tid.
Sended weortheth.
Dropena drearung.
On dæges hwile.
Wearmlic wolcna scur.

Then from the firmament was
An all-bright angel
Sent from above,
A man of beauteous form,
In his garb of glory;
Who to them came for comfort,
And for their lives' salvation,
With love and with grace;
Who the flame scattered
(Holy and heaven-bright)
Of the hot fire,
Swept it and dashed away,
Through his great might,
The beams of flame;
So that their bodies were not
Injured aught:
But in haste he cast
Fireon the foes,
For their wicked deeds.
Then was it in the oven,
Where the angel came,
Windy and winsome,
To the weather likest
When there, in summer's tide,
Is sent
A falling of drops,
In the day's space,
A warm shower of the clouds.

* Thorpe's Cædmon's Paraphrase, p. 23.

Swylc bith wedera cyst.
Swylc wæs on tham fyre.
Frean mihtum.
Halgum to helpe.
Wearth se hata lig.
Todrifen & todwæsced.
Thær tha dæd-hwatan.
Geond thone ofen eodon.
& se engel mid.
Feorh-nerigende.
Se thær feortha wæs.
Annanias.
& Azarias.
& Misael.
Thær tha mod-hwatan
Thry on gethancum.
Theoden heredon.
Bædon bletsian.
Bearn Israela.
Eall land-gesceaft.
Ecne drihten.
Theoda waldend.
Swa hie thry cwædon.
Modum horsce.
Thurh gemæne word.

As is the bounty of the skies,
So was it in the fire,
Through the Lord's might,
In help to the holy ones.
The hot flame was
Scattered and quenched.
There those bold of deed
Went through the oven,
And the angel with them,
Life preserving,
Who was there the fourth.
Hananiah,
And Azariah,
And Mishael.
There those, bold of mind,
The three, in their thoughts,
Praised the Lord,
Prayed him to bless
The children of Israel,
All the land-creation,
The Lord eternal,
Ruler of nations.
Thus they three spake
With minds sagacious
Through common voice.*

We shall now give one or two specimens of the language as it existed in the latter part of the ninth century, from the works of Alfred. The following is the preface to his paraphrase, or imitation of Boethius' *De Consolatione Philosophiæ;* a work which we are assured he carried constantly about him :—

Alfred kuning wæs wealhstod thisse bec. & hie of bec Ledene on Englisc wende. swa hio nu is gedon. hwilum he sette worde be worde. hwilum andgit of andgite. swa swa he hit tha sweotolost and andgitfullicost gereccan mihte for thæm mistlicum & manigfealdum weoruld bisgum the hine oft ægther ge on mode ge on lichoman bisgodan. Tha bisgu us sint swithe earfoth rime the on his dagum on tha ricu becomon the he underfangen hæfde. & theah tha he thas boc hæfde geleornode & of Lædene to Engliscum spelle gewende. tha geworhte he hi efter to leothe. swa swa heo nu gedon is. & nu bit & for Godes naman healsath ælcne thara the thas boc rædan lyste. that he for hine gebidde. & him ne wite gif he hit rihtlicor ongite thonne he mihte. forthæmthe ælc mon sceal be his andgites mæthe and be his æmettan sprecan thæt he sprecth. & don that that he deth.

Alfred, king, was translator of this book, and turned it from book Latin into English, as it now is done. Sometimes he set word by word, sometimes meaning of meaning, as he the most plainly and most clearly could render it, for the various and manifold worldly occupations which often busied him both in mind and body. The occupations are to us very difficult to be numbered, which in his days came upon the kingdoms which he had undertaken; and nevertheless, when he had learned this book, and turned it from Latin into the English language, he afterwards composed it in verse, as it now is done. And he now prays and for God's name implores every one of those whom it lists to read this book, that he would pray for him, and not blame him if he more rightly understand it than he could; for every man must, according to the measure of his understanding, and according to his leisure, speak that which he speaks, and do that which he does.

We add the Story of Orpheus, from the 31st chapter of the work:—

Hit gelamp gio. that te an hearpere. wæs on thære theode. the Thracia hatte. sio wæs on Creca rice. se hearpere was swithe. ungefræglice god. thæs nama wæs Orpheus. he hæfde an swithe ænlic wif. sio wæs haten Eurydice. tha ongann monn secgan. be tham hearpere. that he mihte hearpian that se wuda wagode. and tha stanas hi styredon. for thy swege. & wild deor. thær woldon to irnan. & standon. swilce hi tame wæron. swa stille. theah hi men. oththe hundas. with eodon. that hi hi na ne onscunedon. tha sædon hi. that thæs hearperes wif. sceolde acwelan. & hire sawle. mon sceolde. lædon to helle. tha sceolde se hearpere. weorthan swa sarig. that he ne mihte. on gemong othrum mannum bion. ac teah to wuda. & sæt on thæm muntum. ægther ge dæges. ge nihtes. weop & hearpode. that tha wudas bifodon. & tha ea stodon. & nan heort. ne onscunode. nænne leon. ne nan hara. nænne hund. ne nan neat. nyste

It happened formerly that there was an harper in the country called Thrace, which was in Greece. The harper was inconceivably good. His name was Orpheus. He had a very excellent wife, who was called Eurydice. Then began men to say, concerning the harper, that he could harp so that the wood moved, and the stones stirred themselves at the sound, and wild beasts would run thereto and stand as if they were tame; so still, that though men or hounds pursued them, they shunned them not. Then said they, that the harper's wife should die, and her soul should be led to hell. Then should the harper become so sorrowful that he could not remain among other men, but frequented the wood, and sat on the mountains, both day and night, weeping and harping, so that the woods shook and the rivers stood still, and no hart shunned any lion, nor hare any hound, nor did cattle know any hatred or any

Her endath nu. seo thridde boc Boeties, and ongith ses feorthe.

fear of others, for the sweetness of the sound. Then it seemed to the harper, that he desired nothing in this world. Then thought he, that he would seek the gods of hell, and endeavour to soften them with his harp, and pray that they would give him back his wife. When he came thither, then should there come towards him the dog of hell, whose name was Cerberus (he should have three heads), and began to wag his tail and play with him for his harping. Then was there also a very dreadful gate-keeper, whose name should be Charon. He had also three heads, and he was very old. Then began the harper to beseech him, that he would protect him whilst he was there, and bring him thence again safe. Then did he promise that to him, because he was captivated with the unaccustomed sound. Then went he further, till he met the grim goddesses, whom the common people called Parcæ, of whom they say that they know no respect for any man, but punish every man according to his deserts, and of whom they say that they control every man's fortune. Then began he to implore their mercy. Then began they to weep with him. Then went he farther, and all the inhabitants of hell ran towards him, and led him to their king, and began all to speak with him, and to pray that which he prayed. And the unstill wheel, which Ixion the king of the Lapithæ was bound to for his guilt; that stood still for his harping. And Tantalus the king, who in this world was immoderately greedy, and whom that same vice of greediness followed there; he became quiet. And the Vulture should cease, so that he tore not the liver of Tityus the king, which before therewith tormented him. And all the punishments of the inhabitants of hell were suspended while he harped before the king. When he long and long had harped, then spoke the king of the inhabitants of hell, and said: Let us give the man his wife, for he has earned her by his harping. He then commanded him that he should well observe that he never looked backwards after he departed thence, and said that if he looked backwards he should lose the wife. But men can with great difficulty, if at all, restrain love. Wellaway! What! Orpheus then led his wife with him, till he came to the boundary of light and darkness. Then went the wife after him. When he came forth into the light, then looked he backwards towards the wife. Then was she immediately lost to him. This fable teaches every man who desires to fly the darkness of hell, and to come to the light of the true good, that he regard not his old vices, so that he practise them again as fully as he before did. For whosoever with full will turns his mind to the vices which he had before forsaken, and practises them, and they then fully please him, and he never thinks of forsaking them; then loses he all his former good, unless he again amend it. Here ends the third book of Boethius and begins the fourth.*

A different character of language is found in Athelstan's Song of Victory, which is given in the Saxon Chronicle under the year 938:—

Æthestan cyning	Æthelstan king,
eorla drihten	of earls the lord,
beorna beah-gyfa.	rewarder of heroes,
& his brothor eac	and his brother eke,
Eadmund Ætheling.	Edmund Atheling,
ealdor langyne tyr.	elder of ancient race,
geslogon æt secce	slew in the fight,
sweorda ecgum	with the edge of their swords,

the foe at Brumby!
The sons of Edward
their board-walls clove,
and hewed their banners,
with the wrecks of their hammers.
So were they taught
by kindred zeal,
that they at camp oft
'gainst any robber
their land should defend,
their hoards and homes.
Pursuing fell
the Scottish clans;
the men of the fleet
in numbers fell;
'midst the din of the field
the warrior sweat.
Since the sun was up
in morning-tide,
gigantic light!
glad over the grounds,
God's candle bright,
eternal Lord!
'till the noble creature
sat in the Western main:
there lay many
of the Northern heroes
under a shower of arrows,
shot over shields;
and Scotland's boast,
a Scythian race,
the mighty seed of Mars!
With chosen troops,
throughout the day,
the West-Saxons fierce
press'd on the loathed bands;
hew'd down the fugitives,
and scatter'd the rear,
with strong mill-sharpen'd blades.
The Mercians too
the hard hand-play
spared not to any
of those that with Anlaf
over the briny deep
in the ship's bosom
sought this land
for the hardy fight.
Five kings lay
on the field of battle,
in bloom of youth,
pierced with swords.
So even eke
of the earls of Anlaf;
and of the ship's-crew
unnumber'd crowds.
There was dispersed
the little band
of hardy Scots,
the dread of northern hordes;
urged to the noisy deep
by unrelenting fate!
The king of the fleet
with his slender craft
escaped with his life
on the felon flood;
and so too Constantine,
the valiant chief,
returned to the north
in hasty flight.

among his kindred.
Here was his remnant
of relations and friends
slain with the sword
in the crowded fight.
His son too he left
on the field of battle,
mangled with wounds,
young at the fight.
The fair-hair'd youth
had no reason to boast
of the slaughtering strife.
Nor old Inwood
and Anlaf the more
with the wrecks of their army
could laugh and say,
that they on the field
of stern command
better workmen were,
in the conflict of banners,
the clash of spears,
the meeting of heroes,
and the rustling of weapons,
which they on the field
of slaughter played
with the sons of Edward.
The Northmen sail'd
in their nailed ships,
a dreary remnant,
on the roaring sea;
over deep water
Dublin they sought,
and Ireland's shores,
in great disgrace.
Such then the brothers,
both together,
king and aetheling,
sought their country,
West Saxon land,
in fight triumphant.
They left behind them
raw to devour,
the sallow kite,
the swarthy raven
with horny rib,
and the hoarse vulture,
with the eagle swift
to consume his prey;
the greedy gos-hawk,
and that grey beast
the wolf of the weald.
No slaughter yet
was greater made
e'er in this island,
of people slain,
before this same,
with the edge of the sword;
as the books inform us
of the old historians;
since hither came
from the eastern shores
the Angles and Saxons,
over the broad sea,
and Britain sought,—
fierce battle-smiths,
o'ercame the Welsh,
most valiant earls,
and gained the land.*

* Ingr. Sax. Chron. p. 141—145.

We shall give but one more specimen of the Saxon language, from the Preface to Ælfric's Homilies, probably written some time in the reign of Canute:—

Ic Ælfric munuc & mæsse preost swa theah waccre thonne swilcum hadum gebyrige. wearth asend on Æthelredes dæge cyninges fram Ælfeage biscope Æthelwoldes æfter-gengan to sumum mynstre the is Cernel gehaten thurh Æthelmæres bene thæs thegenes. his gebyrd & goodnys sind gehwær cuthe·· Tha be arn me on mode ic truwige thurh godes gife. thæt ic thas boc of ledenum gereorde to Engliscre spræce awende. na thurh gebylde micelre lare. ac forthan the .ic geseah & gehyrde micel gedwyld on manegum engliscum bocum. The ungelærede men thurh heora bilewitnysse to micclum wisdome tealdon. and me ofhreow thæt hi ne cuthon ne næfdon tha godspellican lare on heora gewritum. buton tham mannum the that leden cuthon. & buton tham bocum the Ælfred cyning snoterlice awende of ledene on Englisc. tha sind to hæbbenne·· For thisum antimbre ic gedyrstlæhte on gode truwiende. that ic thas gesetnysse under gann. & eac fortham the menn behofath godre lare swithost on thisum timan the is ge endung thyssere worulde. & beoth fela frecednyssa on man cynne ærthan the se ende becume. swa swa ure drihten on his godspelle cwæth to his leorning cnihtum··

I Ælfric, monk and mass-priest, although a man of less abilities than are requisite for one in such orders, was sent in the days of King Æthelred from Alphege the bishop, the successor of Æthelwold, to a monastery which is called Cernel, at the desire of Æthelmar the thain, whose noble birth and goodness is everywhere known. Then ran it in my mind, I trust through the grace of God, that I ought to translate this book out of the Latin tongue into the English speech, not upon presumption of great learning, but because I saw and heard much error in many English books, which ignorant men, through their simplicity, esteemed great wisdom, and because it grieved me, that they neither knew, nor had the gospel learning in their writings, except from those men that understood Latin, and those books which are to be had of King Alfred's, which he skilfully translated from Latin into English. For this reason I took courage, trusting in God, to enter upon this task, and because men have now most need of sound doctrine, especially at this time, which is so near the end of the world, and vexations will torment mankind, before the end is come, as our Lord in his gospel said to his disciples.

The reader will remark that the term *English* is more than once used in this extract to designate the Saxon language; but the same name had been applied to it by Bede, himself an Angle, three centuries before. It is impossible also not to be struck with the close resemblance in phrase and style which the earliest and latest specimens of Saxon bear to each other, throughout our selections. The Anglo-Saxon in all these specimens has been given in Roman, not in Saxon characters. With the exception of the þ (*th*, as in *thin*), the ð (*dh*, or *th*, as in *that*), and the ƿ (*w*), the Saxon characters have the same forms with those of the Roman alphabet.

Having given specimens of the language from its earliest to its latest use, we shall now take a rapid survey of what is still remaining of the native literature of the Anglo-Saxons, beginning with their poetry as its oldest branch.

With the exact laws of their metres we are unacquainted. Their poetical compositions, however, strongly resemble the Runic Odes so admirably imitated by Gray; they are generally more or less marked by alliteration, by a mixture of regular and irregular cadence, by abrupt transitions, by a frequent omission of the particles, and by an artificial inversion of words and phrases. At a late period, and in a few instances, we have an approach to rhyme.

The most remarkable poem in the language is the Narrative of the attempt of Beowulf to wreck the fæhthe or deadly feud on Hrothgar; supposed to be founded upon certain mythic legends of the Angles, and to be far older than the writing of the manuscript which contains the story. The copy of this poem, which forms one of the Cottonian volumes (Vitellius, A. xv.), is unique. Wanley first noticed it in 1705; Mr. Sharon Turner made some copious extracts from it in his History of the Anglo-Saxons; and an elaborate memoir upon its composition, accompanied by some criticisms and some beautiful translations, was presented to the literary world by the late Rev. John Josias Conybeare, in his Illustrations of Anglo-Saxon Poetry, 8vo. London, 1826. The earliest publication, however, of the entire work appeared in 4to. at Copenhagen in 1815, with a Latin translation nearly literal, a preface and indices, from the pen of the late Grimm Johnson Thorkelin. It was the second time he had translated it, his first version having been burnt in 1807, in the bombardment of Copenhagen. Another edition of Beowulf has since appeared, more acceptable to the English reader, in two small volumes, one containing the text, 12mo. Lond. 1833; the other, a translation by John Mitchell Kemble, Esq., 12mo. Lond. 1837, with a copious glossary, preface, and philological notes.

Of similar character to Beowulf is the Fragment on the Battle of Finsborough, first printed by Hickes, subsequently in Conybeare's Illustrations, and lastly with the Traveller's Song, as appendages to Beowulf, by Mr. Mitchell Kemble.

Of the metrical Paraphrase of different parts of Scripture, ascribed to a second Caedmon, we have already spoken. It was first published by Junius, in 1655; and lately, with an English translation, under the auspices of the Society of Antiquaries, by Mr. Thorpe, 8vo. Lond. 1832.

A manuscript volume of Saxon poetry given by Bishop Leofric to the cathedral of Exeter, about the time of the Norman conquest, preserves some invaluable relics, among which the Song of the Traveller, already mentioned, stands conspicuous. This volume, which contains a number of Hymns and minor sacred Poems, most of them enumerated

in the Introduction to Conybeare's Illustrations, is preparing for publication under the same auspices, and by the same editor, as the Paraphrase of Caedmon.

The fragment of the Apocryphal History of Judith, printed by Thwaites, at the end of the Heptateuch; the fragment on the Death of Byrthnoth, published by Hearne, from the Cottonian MS., Otho A. xii., at the end of John of Glaston's Chronicle; a short Menology, or poetical Calendar, first printed by Hickes, in the Thesaurus, and since separately, with an English translation and notes, by the Rev. Samuel Fox, 8vo. Lond. 1830; Alfred's Boethian Metres; and some Odes and Elegies in the Saxon Chronicle, in part already referred to, and all translated by Dr. Ingram; form the other chief remains of Saxon poetry.

In scriptural learning, we have the Heptateuch, with the Story of Job, and the Pseudo-Gospel of Nicodemus, to which the fragment of Judith, already mentioned, is added, published at Oxford, in 8vo. 1698; the Gospels of the four Evangelists, with the English in parallel columns, edited by John Foxe, in 1571, under the auspices of Archbishop Parker; the Gothic and Saxon Gospels, by F. Junius and Marshall, published at Dordt, in 1665, and again at Amsterdam in 1684; a Latin and Saxon interlineary version of the Psalms, published from a manuscript in his father's library, by Sir John Spelman, 4to. Lond. 1640*; and a Saxon and English Psalter, published from another manuscript, by Mr. Thorpe, two years ago. No other portions of the Saxon Scriptures now remain except a scattered Gloss upon the Proverbs and some excerpts from Ecclesiasticus, preserved among the Cottonian manuscripts. Humphry Wanley, Lord Oxford's librarian, selected numerous passages of various parts of Scripture, as quoted in the Saxon Homilies, which still remain in manuscript.

Either to enumerate, or enter into the history of the various Saxon Homilies which remain, would occupy a larger space than we can allow. Many of them are not now assignable to any particular author; but the greater part are known to have issued from the pens of Ælfric and Lupus, the latter of whom was the same person with Wulfstan, archbishop of York, and bishop of Worcester. Orm, or Ormin, is the name of another writer whose homilies are preserved among the manuscripts of Junius, at Oxford; and Æthelwold, who became bishop of Winchester in 961, occurs as a fourth Homilist, previous, in point of time, to the former. From these homilies alone can the faith and doctrines of the Saxon church be recovered and explained. Celibacy, it appears, though encouraged among the clergy, was not enjoined: the people as well as the priests were allowed the use of the Scriptures in the native tongue; nor had the Saxon church embraced the doctrine of Transubstantiation. Ælfric's Homilies were principally written at the abbey of Cerne, in Dorsetshire. They were compiled from the writings of St. Augustine of Hippo, St. Jerom, Bede, Gregory, Smaragdus, and Haimo; and were directed to be read constantly to the faithful in the church. Mrs. Elstob, the celebrated female Saxonist, published an English-Saxon Homily on the birthday of St. Gregory, 8vo. Lond. 1709; and she and her brother contemplated a folio edition of the Homilies at large, with an English translation, of which a few sheets only were printed, when the work dropped: their prepared manuscript, in part translated, is preserved in five volumes among the Lansdowne Manuscripts in the British Museum.*

Connected with the Homilies are the Injunctions to the clergy, which go by the name of Ælfric's Canons, drawn up for the use of Wulfsin, bishop of Sherburn. As the Homilies contained the form for the clergy to instruct the laity, these supplied the form for the bishops to instruct their clergy, and they afford the most complete view of the discipline and ceremonies of the Saxon church which can be anywhere obtained.

Some Lives and Passions of the Saints, exclusive of those in the Homilies, translated from the Latin, may be here mentioned, which are still preserved in our manuscript libraries, particularly that of St. Guthlac, in the Cottonian collection, originally written about the year 730, by Felix, a monk of Croyland.

Bishop Ethelwold, about the middle of the tenth century, whilst abbot of Abingdon, received the manor of Sudburn, in Suffolk, from King Edgar, on condition of translating from the Latin the monastic rule of St. Benedict. His Anglo-Saxon version formed afterwards the basis of the Concord of Rules promulgated by Dunstan, of which a fine and contemporary manuscript is preserved in the Cottonian Collection. † Previous to that time the Saxon monks lived principally under the rule which had been brought from Ireland.

Among works connected with theology which remain in manuscript only, are versions of Gregory "De Cura Pastorali," of the "Flores ex D. Augustini Soliloquiorum Libro," and of the "Libri Dialogorum Gregorii Magni et Petri Diaconi ejus." The two first are by King Alfred, who also made the selection of the "Flores:" but the Dialogues of Gregory and Peter Diaconus were translated by Werefrid, bishop of Worcester, one of the learned men who aided Alfred's studies, by whom a short introduction was prefixed. Of these last a beautiful manuscript was all but destroyed in the Cottonian fire of 1731; though other ancient manuscripts of the Dialogues remain in the Bodleian and among Sir William Dugdale's manuscripts at Oxford, and in the library of Corpus Christi College, Cambridge. The Bodleian MS. is of the age of Canute, that in Corpus Christi College a little later than the time of the Conquest.

In Moral Philosophy we have Alfred's version of Boethius "De Consolatione," of which specimens have been already given, but which displays the

* MS. Lansd. No. 370—374.

† MS. Cotton. Tiberius, A. iii.

spirit rather than the letter of Boethius. It is in some cases abridged, and in others paraphrastic. This translation has by some been attributed to Werefrith, bishop of Worcester, and by others to Asser, Bishop of St. David's; but the Cottonian Manuscript, Otho, A. vi., evidently of the ninth century, ascribes it in the proem to Alfred. It was made, we are told, at Woodstock, in Oxfordshire, and so addressed to the passions, as frequently, in the Saxon times, to draw tears from those who read it. Alfred named it Hand-boc, or the manual. The Saxon was first published in 1698 at Oxford, by Christopher Rawlinson, of Carke Hall in Lancashire, from Junius' transcript of a manuscript in the Bodleian, collated with a Cottonian manuscript. It was again published with an English translation and notes, 8vo. 1829, by J. S. Cardale, who has also given a revised copy of the text.

In Civil History we have only one work of primary importance, the Saxon Chronicle; which is, in fact, a collection of chronicles, rather than one uniform work, continued from time to time, to the year 1154. A portion of it was first edited under the name of Chronologia Saxonica, at the end of Wheloc's Bede, fol. Camb. 1644; and an enlarged and improved, though still not a complete edition of the work, was published by Edmund Gibson, then a scholar of Queen's College, Oxford, afterwards bishop of London, 4to. Oxford, 1692, accompanied by an elegant Latin version. An English translation from Gibson's edition, by Miss Gurney, of Keswick, in Norfolk, was printed for private distribution in 1819. Lastly appeared the Saxon Chronicle, with an English translation, and notes, critical and explanatory, by the Rev. J. Ingram, B.D. 4to. Lond. 1823—a work of superior value. A synoptical view of the different manuscripts of the Chronicle which remain is prefixed, with a short grammar of the Anglo-Saxon language.* Fox, in his Acts and Monuments of the Church, speaks of having seen a manuscript in Saxon entitled the Story of Alfred, written by Alfred himself; but no such work is at present known to be extant.

The Ecclesiastical History of the English, by Bede, formed another of King Alfred's translations. It was first edited by Abraham Wheloc, fol. Cambr. 1644, and again by Dr. John Smith at Cambridge in 1722. A third edition is intended to appear, with an English translation, in the great collection of our historians preparing by Mr. Petrie.

We have but one specimen of what may be termed the Saxon knowledge of other countries; and for that, too, we are indebted to King Alfred, who epitomised Orosius, the best abridgment of ancient history then extant. He sometimes deserted his author to make additions, of which the most important of all are an original account of the geography of Germany in the ninth century, and the two voyages of Ohthere and Wulfstan, already noticed. These voyages were edited at the end of the Latin copy of Spelman's Life of Alfred, by the Hon. Daines Barrington, with an English translation, in the body of Orosius, 8vo. Lond. 1773; and again more perfectly in 1807 by Dr. Ingram, at the end of his inaugural lecture as Saxon Professor in the University of Oxford.

We have already mentioned the several printed editions of the Saxon laws by Lambarde, Wheloc, and Wilkins.

A republication of the Anglo-Saxon laws is intended to form a part of the Corpus Historicum, the new History of Britain, undertaken by Mr. H. Petrie.

A separate edition of Canute's Saxon Laws was published at Copenhagen in 4to. in 1826, with numerous Notes, by Professor Rosenvinge.

There is a copy of Wheloc's Archaionomia in the Bodleian Library, in which the celebrated F. Junius has made almost a fresh translation of the Saxon laws neatly written above Lambarde's version.

King Alfred's will is preserved in a register of the Abbey of Newminster at Winchester, founded by that king a short time before his death; and, as a legal document, is interesting to us on many accounts. "First," as is observed in the Preface to the Oxford edition, "we learn from it the ideas entertained by the king and the great men of the realm concerning the succession of the crown in the times of the Saxons. Secondly, we are informed of several particulars relative to the rights, liberties, and privileges of the different orders and degrees of men at that early period. Thirdly, we are furnished with many curious facts which elucidate the nature of the tenures by which estates were held in the time of our Saxon ancestors." Alfred's will was published at Oxford, by the delegates of the University Press, in 4to. in 1788, accompanied by a literal translation from the pen of the Rev. Owen Manning, the editor of Lye's Dictionarium Saxonico et Gothico Latinum. It was re-published, with a preface and additional notes, in 8vo., Lond. 1828.

Here, too, may be mentioned the numerous charters which remain, so extensively illustrative of the civil polity of the Saxons. They are often accompanied by what are termed land-books, or exemplifications of the boundaries of land, in the less-cultivated parts of our country, still useful to topographers.* A collection of these is intended to form one of the divisions of Mr. Petrie's Corpus Historicum.

Our Saxon ancestors were not entirely without treatises on natural knowledge and medicine, or rather medical botany; for their remedies were usually vegetable medicines, sometimes accompanied by incantations. The principal, however, were translations from a Latin herbal falsely ascribed to Apuleius. The most beautiful and curious manuscript which is known of this work is

* Some light has been attempted to be thrown upon the authorship of the different portions of the Saxon Chronicle in a late publication entitled "Ancient History, English and French, exemplified in a Regular Dissection of the Saxon Chronicle." 8vo. Lond. 1830.

* See Sir Richard Hoare's Registrum Wiltunense.

preserved in the Cottonian Library,* accompanied by the Medicina ex Quadrupedibus; with drawings not only of the herbs and animals, but of Æsculapius, Apuleius Platonicus, and Chiron, whom the Greeks reputed the inventor of medicine. Another ancient manuscript of it occurs, though without the drawings, in the Hatton Collection at Oxford,† and a third Herbal is particularly described by Wanley in the Catalogue which accompanies Dr. Hickes' Thesaurus.‡ It forms a small thick volume in octavo, largely written, and contains a few specimens of incantations. The most valuable manuscript in medicine, however, is the Liber Medicinalis in the Royal Library now at the British Museum.§ It appears to have been the work of one BALD, and was compiled from the old Latin physicians, such as Marcellus, Scribonius Largus, Pliny, Cœlius Aurelianus, and Theodorus Priscianus; and is evidently of the tenth century, if not earlier.

In Romance Literature we have a fragment of the story of Apollonius of Tyre, which has been carefully edited from a manuscript in the Library of Corpus Christi College, Cambridge, with a translation by Mr. Benjamin Thorpe, 8vo. Lond. 1834. The Latin of this Romance forms the 153rd chapter of the Gesta Romanorum. The story, as is well known, is the same upon which the play of Pericles was founded, attributed to Shakspeare.

In Grammatical Learning we have a valuable though late treatise, of which the best manuscripts have been neglected. It is a translation of the younger Priscian by Archbishop Ælfric, accompanied by a glossary of words. Somner, in the preface to his Dictionary, complains of the errors and barbarity of the ancient copy of this glossary which he used from the library of his and Junius' friend Rubenius at Brussels; and Skynner, in his Etymologicon, has also noticed its errors. It is remarkable that, at the close of his preface, Ælfric should express a fear that his labours would in after times be mutilated by transcribers. The variations in the different copies of the Glossary now remaining prove the reality of his suspicions. There are several copies both of the Grammar and the Glossary among the Cottonian and Harleian manuscripts in the British Museum; but the finest of all, and by far the most copious manuscript, is in the Library of St. John's College, Oxford, improved by Ælfric Bata, the grammarian's scholar. This manuscript is very different from the other copies, and is accompanied with Dialogues by both Ælfrics.

Such forms the general survey of the native literature of the Anglo-Saxons. We have not mentioned every fragment which remains, but the reader who would be more inquisitive has only to refer to Humphry Wanley's Catalogue of Saxon Manuscripts, inserted in Dr. Hickes' Thesaurus, which Wanley travelled through England to compile.

Limited as the circle of Saxon literature and science may appear, it is impossible not to reflect with wonder on the exertions of the man to whom we are indebted for the greater part; who, amidst the most violent commotions of the state, found leisure not only to rival the illustrious Charlemagne in the protection and promotion of literary merit, but to surpass him in the personal exertions of a strong and active genius.*

But even at this early period the Saxon is not our only native literature that claims some notice. The Irish were probably possessed of the knowledge of letters from a very remote antiquity; for, although the forms of their present alphabetical characters are Roman, and were probably introduced by St. Patrick, it is very remarkable, as we have before observed, that the alphabet, in the number and powers of its elements, exactly corresponds with that which Cadmus is recorded to have brought to Greece from Phenicia. If we may believe the national traditions, and the most ancient existing chronicles, the Irish also possessed a succession of Bards from their first settlement in the country; and the names at least of some of those that are said to have flourished so early as in the first century of our era are still remembered. But the oldest bardic compositions that have been preserved are of the fifth century. Some fragments of metrical productions to which this date is attributed are found in the old annalists, and more abundant specimens occur in the same records under each of the succeeding centuries. The oldest existing Irish manuscript, however, is believed to be the Psalter of Cashel, a collection of bardic legends, compiled about the end of the ninth century, by Cormac Mac Culinan, bishop of Cashel and king

§ 12 D. xvii.

* Hearne in a Note to the English edition of Spelman's Life of Alfred, from a memorandum among Dr. James' manuscripts in the Bodleian Library, mentions a translation by King Alfred of Æsop's Fables from the Greek into Latin and Saxon; and it is not a little remarkable that the same fact is recorded in one of the old Lays in the Romance language, the Lay of Æsop, the author of which writes that Æsop's Fables were translated out of Greek into Latin and into English, by King Alfred, from whose version, now lost, he made his own in French:—

Esope apelum cest liure,
Qu'il transla'a e fist escrire

Harl. MS. 978, fol. 60.

In prosecuting the study of Anglo-Saxon literature the reader will find Dr. Hickes' "Linguarum Vett. Septentrionalium Thesaurus," 3 tom. fol. Oxon. 1705, an indispensable work for consultation. The Dictionaries are, Somner's, fol. Oxford, 1659, and Lye's "Dictionarium Saxonico et Gothico Latinum," edited by O. Manning, 2 vols. fol. Lond. 1772, with Benson's Vocabulary, chiefly abridged from Somner, 8vo. Oxf. 1701. The earliest Grammar was Dr. Hickes's, 4to. Oxf. 1689, reprinted with additions in the Thesaurus, and published in an abridged form by Ed. Thwaites, 8vo. Oxf. 1711; Elstob's Grammar, 4to. Lond. 1715; Orator Henley's, 8vo. Lond. 1720; Manning's, prefixed to Lye's Dictionary, fol. 1772; Ingram's short Grammar, prefixed to the Saxon Chronicle, 4to. Lond. 1823; Bosworth's Elements, accompanied by a Grammatical Praxis, 8vo. Lond. 1823, followed by his Compendious Grammar, 8vo. Lond. 1826; Gwilt's Rudiments, 8vo. Lond. 1829; and Raske's Grammar of the Anglo-Saxon Tongue, translated from the Danish by B. Thorpe, 2nd edit. 8vo. Copenh. 1830. Raske's Grammar was first published at Copenhagen, 8vo. 1817. To these may be added, "Analecta Anglo-Saxonica. A Selection, in prose and verse, from Anglo-Saxon authors of various ages; with a Glossary. Designed chiefly as a First Book for Students." By Benjamin Thorpe. 8vo. Lond. 1834.

of Munster. But the most valuable remains of this period of Irish literature that have come down to us are the various historical records in prose, called the Annals of Tigernach, of the Four Masters of Ulster, and many others. The most important of these have been published in the original, and accompanied with Latin translations, in Dr. O'Conor's 'Rerum Hibernicarum Scriptores Veteres,' 4 vols. 4to. Buckingham, 1814-1826; a splendid monument of the munificence of his grace the present Duke of Buckingham, at whose expense the work was prepared and printed, and from the treasures of whose library its contents were principally derived. Tigernach, the oldest of these Irish annalists whose works we have in the original form, lived in the latter part of the eleventh century; but both his and the other Annals profess, and are believed, to have been compiled from authentic records of much greater antiquity. They form undoubtedly a collection of materials in the highest degree precious for the information they supply with regard to the history both of Ireland and of the other early British kingdoms. These Annals differ wholly in character from the metrical legends of Irish history found in the book of Cashel and in the other later compositions of the Bards. They consist of accounts of events related for the most part both with sobriety and precision, and with the careful notation of dates that might be expected from a contemporary and official recorder. They are in all probability, indeed, copies of, or compilations from, public records.

Not of such historic importance, but still more curious and interesting in another point of view, are the remains we still possess of the early Welsh literature. The Welsh have no annals to be compared in value with those of the Irish; but some of their Bruts, or chronicles, fabulous as they evidently in great part are, are undoubtedly of considerable antiquity. There can be little doubt that Geoffrey of Monmouth's Latin history is really a translation from a much older Welsh original. The Chronicle of Tyssilio, who flourished in the seventh century, still survives, and has been published in the original (in the Welsh Archæology), as well as in an English translation, by the Rev. Peter Roberts, 8vo. Lond. 1810. The Laws of Howel Dha, who reigned in South Wales in the early part of the tenth century, have been printed with a Latin translation, by Wotton, in his Leges Wallicæ, fol. 1730. They develope a state of society in which many primitive features are strangely mixed up with a general aspect of considerable civilization, and all the order of a well-established political system. Then there are the singular compositions called the Triads, which are enumerations of events or other particulars, bound together in knots of three, by means of some title or general observation—sometimes it must be confessed forced and far-fetched enough—under which it is conceived they may all be included. Of the Triads, some are moral, and others historical. The historical are certainly not all ancient; for they contain allusions to events that took place in the reign of our Edward I.; but it appears most probable that the form of composition which they exemplify was long in use; and, if so, the comparatively modern character of some of them does not disprove the antiquity of others. A late writer, who considers them to be a compilation of the thirteenth century, admits that they "reflect, in a small and moderately faithful mirror, various passages of bardic composition which are lost."* The most voluminous of the ancient Welsh remains, however, are the poems of the Bards. The authenticity of these compositions may be considered to be now established, beyond dispute, by the labours of various writers by whom the subject has been recently investigated, and especially by Mr. Turner's able and elaborate 'Vindication.'† The most ancient of them are the poems ascribed to the four bards, Aneurin, Taliesin, Llywarch Hen, and Merdhin, or Merlin, the Caledonian, who all appear to have belonged to the sixth century. A few additional pieces have also been preserved of the seventh, eighth, ninth, tenth, and eleventh centuries, which are printed along with these in the first volume of the 'Myrvyrian Archæology of Wales,' 3 vols. 8vo. Lond. 1801. Much of this early Welsh poetry is in a strangely mystical style, and its general spirit is evidently much more Druidical than Christian. The author of 'Britannia after the Romans' has endeavoured to show that a revival of Druidism was effected in Wales in the sixth century, principally through the efforts of the Bards, whose order had formerly composed so distinguished a part of that system; and certainly the whole character of this ancient poetry seems strongly to confirm that supposition, which does not, however, rest upon this evidence alone. No existing manuscript of these poems, we may observe, nor any other Welsh manuscript, appears to be much older than the twelfth century.

As the forms of the Saxon alphabetical characters are the same with those of the Irish, it is probable that it was from Ireland the Saxons derived their first knowledge of letters. There was certainly, however, very little literature in the country before the arrival of Augustin, in the end of the sixth century. Augustin is supposed to have established schools at Canterbury; and about a quarter of a century afterwards, Sigebert, king of the East Angles, who had spent part of his early life in France, is stated by Bede to have, upon his coming to the throne, founded an institution for the instruction of the youth of his dominions similar to those he had seen abroad. The schools planted by Augustin at Canterbury were afterwards greatly extended and improved by his successor, Archbishop Theodore, who obtained the see in 668. Theodore and his learned friend Adrian, Bede informs us, delivered instructions to crowds of pupils, not only in divinity, but also in astronomy, medi-

cine, arithmetic, and the Greek and Latin languages. Bede states, that some of the scholars of these accomplished foreigners were alive in his time, to whom the Greek and Latin were as familiar as their mother tongue. Schools now began to multiply in other parts, and were generally to be found in all the monasteries and at the bishops' seats. Of these episcopal and monastic schools, that founded by Bishop Benedict, in his abbey at Wearmouth, where Bede was educated, and that which Archbishop Egbert established at York, where Alcuin studied, were among the most famous. Others of great reputation were superintended by learned teachers from Ireland. We have already mentioned that of Maildulf at Malmesbury, to which Aldhelm repaired after having studied for some time under Adrian. At Glastonbury also, it is related in the life of St. Dunstan, some Irish ecclesiastics had settled, the books belonging to whom Dunstan is recorded to have diligently studied. The northern parts of the kingdom were indebted for the first light of learning as well as of religion to the missionaries from Iona.

It should not seem to be altogether correct to attribute the decline and extinction of this earliest literary civilization of the Anglo-Saxons wholly to the Danish invasions. The Northmen did not make their appearance till towards the close of the eighth century, nor did their ravages occasion any considerable public alarm till long after the commencement of the ninth; but for a whole century preceding this date, learning in England appears to have been falling into decay. Bede, who died in 735, exactly ninety-seven years before that landing of the Danes in the Isle of Sheppey, in the reign of Egbert,* which was followed by incessant attacks of a similar kind, until the fierce marauders at last won for themselves a settlement in the country, is the last name eminent for scholarship that occurs in this portion of the English annals. The historian Malmesbury, indeed, affirms that the death of Bede was fatal to learning in England, and especially to history; "insomuch that it may be said," he adds, writing in the early part of the twelfth century, "that almost all knowledge of past events was buried in the same grave with him, and hath continued in that condition even to our times." "There was not so much as one Englishman," Malmesbury declares, "left behind Bede, who emulated the glory which he had acquired by his studies, imitated his example, or pursued the path to knowledge which he had pointed out. A few, indeed, of his successors were good men, and not unlearned, but they generally spent their lives in an inglorious silence; while the far greater number sunk into sloth and ignorance, until by degrees the love of learning was quite extinguished in this island for a long time."

The devastations of the Danes completed what had probably been begun by the confusion of the internal dissensions that attended the breaking up of the original system of the heptarchy, and perhaps also by the natural decay of the national spirit among a race long habituated to a stirring and adventurous life, and now left in indisturbed ease and quiet before the spirit of a new and superior activity had been sufficiently diffused among them. Nearly all the monasteries and the schools connected with them throughout the kingdom were either actually laid in ashes by the northern invaders, or were deserted in the general terror and distraction occasioned by their attacks. When Alfred was a young man, about the middle of the eighth century, he could find no masters to instruct him in any of the higher branches of learning; there were at that time, according to his biographer Asser, few or none among the West Saxons who had any scholarship, or could so much as read with propriety and ease. The reading of the Latin language is probably what is here alluded to. Alfred has himself stated, in the preface to his translation of Gregory's Pastoralia, that though many of the English at his accession could read their native language well enough, the knowledge of the Latin tongue was so much decayed, that there were very few to the south of the Humber who understood the common prayers of the church, or were capable of translating a single sentence of Latin into English; and to the south of the Thames he could not recollect that there was one possessed of this very moderate amount of learning. Contrasting this lamentable state of things with the better days that had gone before, he exclaims, "I wish thee to know that it comes very often into my mind, what wise men there were in England, both laymen and ecclesiastics, and how happy those times were to England! The sacred profession was diligent both to teach and to learn. Men from abroad sought wisdom and learning in this country, though we must now go out of it to obtain knowledge if we should wish to have it."

It was not till he was nearly forty years of age, that Alfred himself commenced his study of the Latin language. Before this, however, and as soon as he had rescued his dominions from the hands of the Danes, and reduced these foreign disturbers to subjection, he had exerted himself with his characteristic activity in bringing about the restoration of letters as well as of peace and order. He had invited to his court all the most learned men he could discover anywhere in his native land, and had even brought over instructors for himself and his people from other countries. Werfrith, the bishop of Worcester; Ethelstan and Werwulf, two Mercian priests; and Plegmund, also a Mercian, who afterwards became archbishop of Canterbury, were some of the English of whose superior acquirements he thus took advantage. Asser he brought from the western extremity of Wales. Grimbald he obtained from France, having sent an embassy of bishops, presbyters, deacons, and religious laymen, bearing valuable presents to his ecclesiastical superior Fulco, the archbishop of Rheims, to ask permission for the great scholar to be allowed to come to reside in England. And so

* See ante, p. 151.

in other instances, like the bee, looking everywhere for honey, to quote the similitude of his biographer, this admirable prince sought abroad in all directions for the treasure which his own kingdom did not afford.

The works which he is known to have translated from the Latin, after he had acquired that language, have been enumerated in a preceding page. These labours, so interesting and valuable to posterity, he seems himself to have been half inclined to regard as to be justified only by the low state into which all learning had fallen among his countrymen in his time, and as likely perhaps to be rather of disservice than otherwise to the cause of real scholarship. Reflecting on the erudition which had existed in the country at a former period, and which had made those volumes in the learned languages useful that now lay unopened, "I wondered greatly," he says, "that of those good wise men who were formerly in our nation, and who had all learned fully these books, none would translate any part into their own language; but I soon answered myself, and said, they never thought that men would be so reckless, and that learning would be so fallen. They intentionally omitted it, and wished that there should be more wisdom in the land, by many languages being known." He then called to recollection, however, what benefit had been derived by all nations from the translation of the Greek and Hebrew Scriptures, first into Latin, and then into the various modern tongues; and, "therefore," he concludes, "I think it better, if you think so (he is addressing Wulfsig, the bishop of London), that we also translate some books, the most necessary for all men to know, that we all may know them; and we may do this, with God's help, very easily, if we have peace; so that all the youth that are now in England, who are freemen, and possess sufficient wealth, may for a time apply to no other task till they first well know to read English. Let those learn Latin afterwards, who will know more, and advance to a higher condition." In this wise and benevolent spirit he acted. The old writers seem to state that, besides the translations that have come down to us, he executed many others that are now lost.

It is probable, though there is no sufficient authority for the statement, that Alfred re-established many of the old monastic and episcopal schools in the various parts of the kingdom. Asser expressly mentions that he founded a seminary for the sons of the nobility, to the support of which he devoted no less than an eighth part of his whole revenue. Hither even some noblemen repaired who had far outgrown their youth, but nevertheless had scarcely or not at all begun their acquaintance with books. In another place Asser speaks of this school, to which Alfred is stated to have sent his own son Aethelweard, as being attended not only by the sons of almost all the nobility of the realm, but also by many of the inferior classes. It was provided with several masters. The common opinion is, that this seminary, instituted by Alfred, is to be considered as the foundation of the illustrious University of Oxford.

Up to this time absolute illiteracy seems to have been common even among the highest classes of the Anglo-Saxons. We have just seen that, when Alfred established his schools, they were as much needed for the nobility who had reached an advanced or a mature age as for their children; and indeed the scheme of instruction seems to have been intended from the first to embrace the former as well as the latter, for, according to Asser's account, every person of rank or substance who, either from age or want of capacity, was unable to learn to read himself, was compelled to send to school either his son or a kinsman, or, if he had neither, a servant, that he might at least be read to by some one. Anglo-Saxon charters exist, which, instead of the names of the kings, exhibit their marks, used, as it is frankly explained, in consequence of their ignorance of letters.

The measures begun by Alfred for effecting the literary civilization of his subjects were probably pursued under his successors; but the period of the next three quarters of a century, notwithstanding some short intervals of repose, was on the whole too troubled to admit of much attention being given to the carrying out of his plans, or even, it may be apprehended, the maintenance of what he had set up. Dunstan, indeed, during his administration, appears to have exerted himself with zeal in enforcing a higher standard of learning as well as of morals, or of asceticism, among the clergy. But the renewal of the Danish wars, after the accession of Ethelred, and the state of misery and confusion in which the country was kept from this cause till its conquest by Canute, nearly forty years after, must have again laid in ruins the greater part of its literary as well as ecclesiastical establishments. The concluding portion of the tenth century was thus, probably, a time of as deep intellectual darkness in England as it was throughout most of the rest of Europe. Under Canute, however, who was a wise as well as a powerful sovereign, the schools no doubt rose again and flourished. We have the testimony of the historian Ingulphus, who wrote immediately after the Norman conquest, but whose boyhood coincided with the early part of the reign of the Confessor, that at that time seminaries of the higher as well as elementary learning existed in England. He tells us that, having been born in the city of London, he was first sent to school at Westminster; and that from Westminster he proceeded to Oxford, where he studied the Aristotelian philosophy and the rhetorical writings of Cicero. This is, we believe, the earliest express mention of the University of Oxford.

The studies that were cultivated in those ages were few in number and of very limited scope. Alcuin, in a letter to his patron Charlemagne, has enumerated, in the fantastic rhetoric of the period, the subjects in which he instructed his pupils in the school of St. Martin. "To some," says he, "I administer the honey of the sacred writings;

others I try to inebriate with the wine of the ancient classics. I begin the nourishment of some with the apples of grammatical subtlety. I strive to illuminate many by the arrangement of the stars, as from the painted roof of a lofty palace." In plain language, his instructions embraced grammar, the Greek and Latin languages, astronomy, and theology. In the poem in which he gives an account of his own education at York, the same writer informs us that the studies there pursued comprehended, besides grammar, rhetoric, and poetry, "the harmony of the sky, the labour of the sun and moon, the five zones, the seven wandering planets; the laws, risings, and settings of the stars, and the aërial motions of the sea; earthquakes; the nature of man, cattle, birds, and wild beasts, with their various kind and forms; and the sacred Scriptures."

This poem of Alcuin's is especially interesting for the account it gives us of the contents of the library collected by Archbishop Egbert at York, the benefit of which Alcuin had enjoyed in his early years, and which he seems to speak of in his letter to Charlemagne, already quoted, as far superior to any collection then existing in France. He proposes that some of his pupils should be sent to York to make copies of the manuscripts there for the imperial library at Tours. Among them, he says, were the works of Jerome, Hilary, Ambrose, Austin, Athanasius, Orosius, the Popes Gregory and Leo, Basil, Fulgentius, Cassiodorus, John Chrysostom, Athelmus, Bede, Victorinus, Boethius; the ancient historical writers, as he calls them, Pompeius (most probably Justin, the epitomizer of the lost Trogus Pompeius), and Pliny; Aristotle, Cicero; the later poets Sedulius and Juvencus; Alcuin himself, Clement, Prosper, Paulinus, Arator, Fortunatus, and Lactantius (writers of various kinds evidently thus jumbled together to suit the exigencies of the verse); Virgil, Statius, Lucan; the author of the Ars Grammaticæ; the grammarians and scholiasts, Probus, Phocas, Donatus, Priscian, and Servius; Entychius; Pompeius (probably Festus) and Commenianus; besides, he adds, many more whom it would be tedious to enumerate. This was certainly a very extraordinary amount of literary treasure to be amassed in one place, and by one man, at a period when books were everywhere so scarce and necessarily bore so high a price. "Towards the close of the seventh century," says Warton, in his Dissertation on the Introduction of Learning into England, "even in the Papal library at Rome, the number of books was so inconsiderable that Pope St. Martin requested Sanctamand, Bishop of Maestricht, if possible, to supply this defect from the remotest parts of Germany. In the year 855, Lupus, Abbot of Ferrières in France, sent two of his monks to Pope Benedict the Third, to beg a copy of Cicero de Oratore, and Quintilian's Institutes, and some other books: 'for,' says the Abbot, 'although we have part of these books, yet there is no whole or complete copy of them in all France.' Albert, Abbot of Gemblours, who with incredible labour and immense expense had collected an hundred volumes on theological and fifty on profane subjects, imagined he had formed a splendid library. About the year 790 Charlemagne granted an unlimited right of hunting to the Abbot and monks of Sithiu, for making their gloves and girdles of the skins of the deer they killed, and covers for their books. We may imagine that these religionists were more fond of hunting than of reading. It is certain that they were obliged to hunt before they could read; and, at least, it is probable that under these circumstances, and of such materials, they did not manufacture many volumes. At the beginning of the tenth century books were so scarce in Spain, that one and the same copy of the Bible, St. Jerome's Epistles, and some volumes of ecclesiastical offices and martyrologies, often served several different monasteries." To these instances we may add what Bede relates in his History of the Abbots of Wearmouth, in which monastery, as already mentioned, Benedict Biscopt, the founder, had about the end of the seventh century collected a considerable library, at the cost not only of much money, but also of no little personal exertion, having made five journeys to Rome for the purchase of books, relics, and other furniture and decorations for the establishment. Bede records that Benedict sold one of his volumes, a work on cosmography, to his sovereign, Alfred of Northumberland, for eight hides of land.

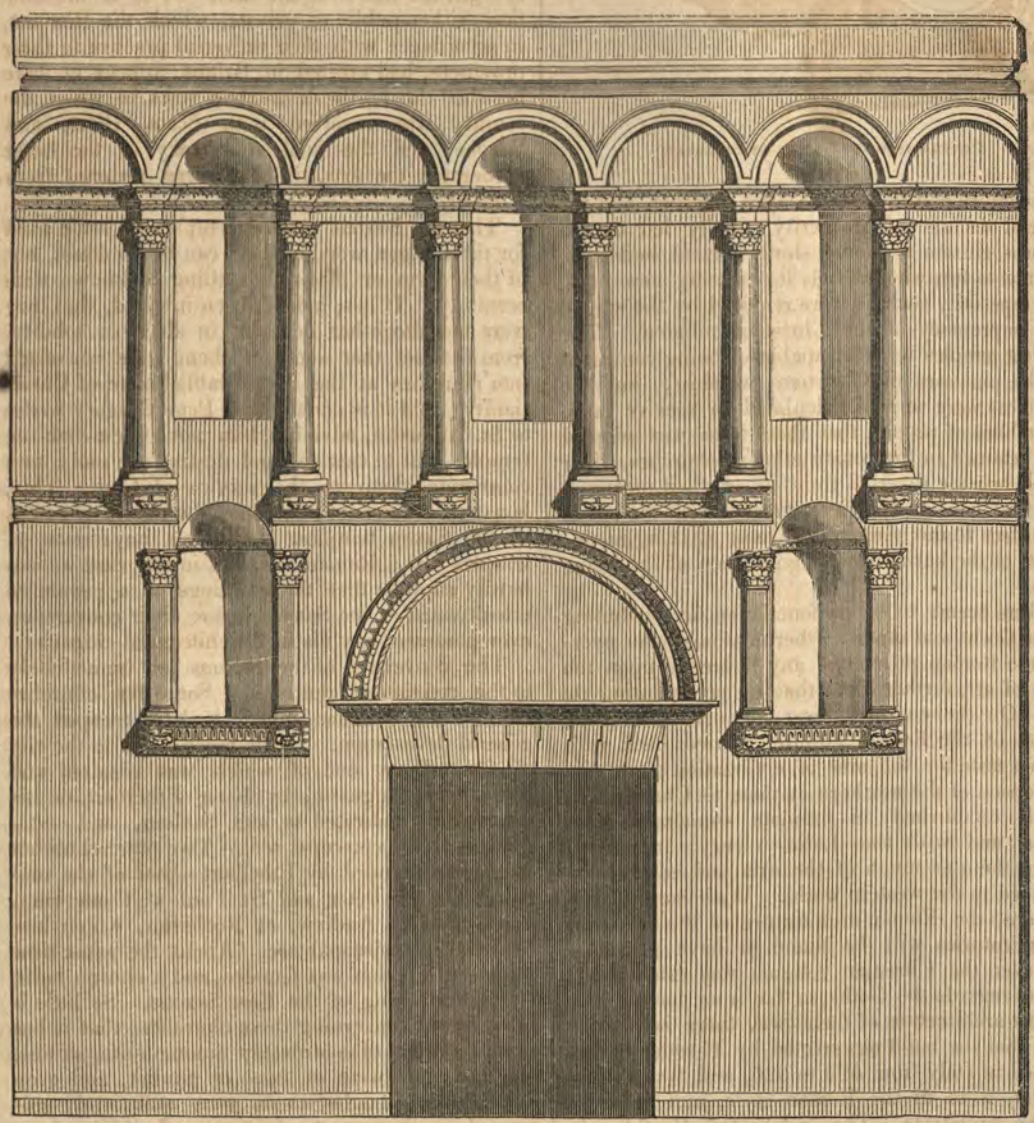
The account which has been given of the existing remains of the Saxon literature, and of the other works of the period under review, has sufficiently indicated the branches of learning and science that were chiefly cultivated. We shall, therefore, merely add a short account of the state of the fine arts of architecture, sculpture, painting, and music among the Anglo-Saxons.

It will be proper to introduce our notice of the Anglo-Saxon architecture by a short inquiry into its origin, especially as we shall find that the Norman style, and perhaps in some particulars that of the middle ages in general, may be traced to the same source.

The pure style of classical architecture perfected by the Greeks, underwent several modifications in the hands of the Romans, which materially changed its character, and finally led to its debasement. Even the Roman temples, which are direct imitations of those of the Greeks, have not the same purity of style, though superior to them in magnificence; and in their more extensive works, the use of the arch draws a strong line between the architecture of the Romans and that of the Greeks, the distinctive characteristic of the latter being the horizontal architrave supported on columns. But though the Romans adopted the arch in their constructions, they did not therefore abandon the architectural details of the Greeks; when, from the introduction of vaulted coverings and arched forms generally, columns ceased to be used as supports,

they were retained as ornaments; and it is this combination of incongruous members, of vaults with columns and horizontal architraves, to which, by the gradual addition of other corruptions, we owe the style of architecture which at length became universal throughout the extent of the Roman empire, and to which has been given the name of Romanesque.

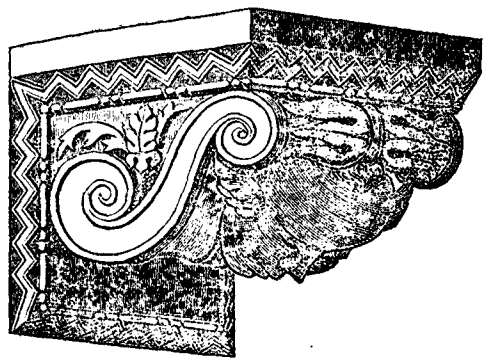
To this point, the decline of the Roman architecture was rapidly advancing as early as the reign of Diocletian. In the baths of Diocletian at Rome, vast groined vaultings are supported on columns, and their outward thrust counterpoised by external piers, performing the same office as the buttresses so extensively introduced into the constructions of later ages. In the palace of Spalatro, built by the same emperor, the porticoes of the internal courts are formed by arches springing



Golden Gate of the Palace of Diocletian at Spalatro.

directly from single columns; and over the principal entrance, or golden gate of the palace, small arches springing from columns—the columns resting on consoles projecting from the wall—are introduced merely as a decoration; and it is a curious coincidence with reference to the purpose for which this example is cited, that we find in the consoles two forms which make a most important figure in the decorations of the 11th century, viz., the zigzag ornament and the corbel head.

To what state of decay the arts had fallen when Constantine removed the seat of empire to Byzantium, may be seen by such parts of his triumphal arch at Rome, as were the work of that period.



CONSOLE FROM THE PALACE AT SPALATRO.

The empire and the arts decayed together, and the general decline of prosperity finally led to the ruinous custom of demolishing ancient buildings, in order to furnish materials for erecting new ones, and especially such as were required by the spread and supremacy of the Christian religion. The ancient temples were incapable of being converted to the purposes of Christian worship; but the Basilicas were so well calculated to receive large assemblies of people, that their form was adopted and retained in the construction of churches, their name became diverted from its original meaning, and the Christian Basilicas, erected with the spoils of ancient Rome, remain the most striking monuments of the barbarous magnificence of the lower ages.

There seems to be no foundation for attributing to the Goths and other northern nations who overran the Roman provinces, any influence upon the state of art, further than that of precipitating its fall. On the contrary, these conquerors, with the wealth of the Roman empire, carried back with them a taste for the arts of civilization; and the conversion of the northern nations to Christianity, which established an intimate connexion with Rome and with the Latin clergy, introduced among them as much of the arts and sciences as survived in the western world. With some modifications, the Roman architecture of the fifth and sixth centuries will be found to have prevailed wherever the Christian religion was established; and as regards the Goths, so far from having any distinct architecture of their own, there is positive proof that the buildings erected by Theodoric, who reigned in Italy from 493 to 526, and was a great builder, were in the Roman style, and built by Roman architects. The celebrated Boethius is named by Cassiodorus as one of the architects of that conqueror. Nor is there any proof that the Lombards carried with them into Italy any innovations in architecture, or that during the existence of their kingdom, which lasted for above two centuries, they introduced any deviations from the style they found established there. Whatever modifications architecture may have received in Italy, are probably to be attributed to the Byzantines, who long took the lead in all matters connected with the arts.

Admitting this view of the state of the arts subsequently to the time of Constantine the Great, we shall not expect to find any original traces of art among a people in so rude a state as the Saxons at the time of their settlement in England. They came as invaders and destroyers; they entered an abandoned and despoiled province, and neither brought nor inherited the arts. Most of the edifices, either public or private, which the Romans, in accordance with their universal practice in their provinces, had erected in Britain, appear to have perished during the devastating wars in which the country was involved with Scots, Picts, and Saxons; and the final supremacy of the latter obliterated the arts, till they were restored from without.

That the Saxons erected temples of some kind for their pagan worship there can be no doubt, but of their form or materials nothing is known with certainty. It has, indeed, been inferred, that they were not altogether deficient in show or solidity, from the fact that some of them were converted into churches at the first establishment of Christianity; and it is certain that Pope Gregory writes to St. Augustin, advising him not to demolish the temples, but to cast out and destroy the idols, and consecrate them to the service of God. This, however, throws no light upon the nature or extent of the Saxon temples. Gregory's impression of temples was a Roman one, and in any case we can hardly suppose that the buildings of a people so uncultivated as the Saxons before their conversion, ever possessed any distinct architectural character.

The conversion of the Saxons led immediately to the erection of churches. Some few churches left by the Romans appear to have escaped the general devastation. Bede records two in the city of Canterbury, one of which was repaired and given to St. Augustin, by King Ethelbert, on his conversion, dedicated to our Saviour, and established as the episcopal see. Two other churches were also founded by Ethelbert—that of the monastery of St. Peter and St. Paul at Canterbury, and that of St. Andrew, at Rochester, which also became an episcopal see. About the same time the see of London was founded, and a church built, by Sebert, king of the East Saxons. So little is upon record concerning these churches, that it has been a subject of controversy among antiquarians, whether they were of stone or timber, and even whether the Anglo-Saxons were sufficiently advanced in the arts to erect stone buildings for a considerable time afterwards. That many timber buildings were erected about this period, there is no doubt. The first chapel or oratory erected by Edwin, king of Northumberland, at York, in 627, was of timber. A wooden church is mentioned by William of Malmesbury, at Dutlinge, in Somersetshire; and the cathedral of Lindisfarne was built in 652 entirely of sawn oak, and even covered with thatch, till Eadbert, the seventh bishop of Lindis-

farne, replaced the thatch with lead. But the cathedral of York, founded by Edwin soon after his baptism, was undoubtedly a stone building, and it marks the progress of the arts in this century, that in 669 Bishop Wilfrid glazed the windows. The glass for this purpose seems to have been imported from abroad, since, as we have already mentioned, the famous Benedict Biscop, abbot of Wearmouth, is recorded as the first who brought artificers skilled in the art of making glass into this country from France (about 676). These artificers not only glazed the windows of Biscop's church at Wearmouth, but taught their art to the native workmen: before this period, windows even of churches were enclosed by lattice-work, or sometimes by linen blinds.

These two prelates, Wilfrid and Benedict Biscop, were the most munificent patrons of architecture in the seventh century. The monastery of Wearmouth was begun by the latter in the year 675, when he went over to France, in order to engage artificers to execute his church "in the Roman manner," as it is expressly termed by Bede. In the same style must have been the buildings of Wilfrid, enumerated in his life by Eddius, of which the most important, and indeed one of the most important buildings of the age, if we may believe the biographer, was the church of St. Andrew, at Hexham, of which Wilfrid laid the foundation in 674. Eddius expatiates at some length upon the glories of this edifice, of which, he says, the like is not to be seen on this side the Alps. But it will be more to the purpose to quote the description of Richard, Prior of Hexham, who wrote toward the end of the 12th century, when it was still in existence; and as he might compare this church with those by which the Normans had then attested their magnificence and skill in architecture, there can be no doubt that it really merited his praises, from which we cannot but conceive a somewhat high idea of the state of architecture among the Anglo-Saxons at this period. Prior Richard's description is as follows.

"The foundations of this church St. Wilfrid laid deep in the earth for the crypts and oratories, and the passages leading to them, which were then with great exactness contrived and built under ground. The walls, which were of great length, and raised to an immense height, and divided into three several stories or tiers, he supported by square and various other kinds of well-polished columns. Also, the walls, the capitals of the columns which supported them, and the arch of the sanctuary, he decorated with historical representations, imagery, and various figures in relief, carved in stone, and painted with a most agreeable variety of colours. The body of the church he compassed about with pentices and porticoes, which, both above and below, he divided with great and inexpressible art, by partition walls and winding stairs. Within the staircases, and above them, he caused flights of steps and galleries of stone, and several passages leading from them both ascending and descending, to be artfully disposed, that multitudes of people might be there, and go quite round the church, without being seen by any one below in the nave. Moreover, in the several divisions of the porticoes or aisles, both above and below, he erected many most beautiful and private oratories of exquisite workmanship, and in them he caused to be placed altars in honour of the Blessed Virgin Mary, St. Michael, St. John the Baptist, and the holy apostles, martyrs, confessors, and virgins, with all decent and proper furniture to each of them; some of which, remaining at this day, appear like so many turrets and fortified places."

The same historian mentions three other churches remaining at Hexham, all of which he attributes to the munificence of Wilfrid. One of these, dedicated to the Blessed Virgin, is particularly worthy of notice. It is described as being in the form of a tower, almost circular, having four porticoes at the four principal points. We may here see the rudiments of a cruciform church with a tower at the intersection, a form which subsequently became universal in large churches, and of which the adoption was accompanied by important changes of style in the architecture of the tenth and eleventh centuries.

Wilfrid appears to have been one of the most enterprising and enlightened prelates of his age. He was in high favour with Oswy, king of Northumberland, and for some part of his reign with Egfrid; and, by his influence with them and the nobility, enriched the church, and obtained the funds necessary to carry his designs into effect. According to his biographer Eddius, he was himself eminent for his skill in architecture, and principal director of his own works, with the assistance of many eminent artists, whom he invited from Rome, and retained in his service by his liberality. Eddius was engaged by him, in conjunction with Eona, to instruct his choir in the Roman manner of singing.

In the beginning of the eighth century the arts had begun to penetrate into the northern parts of our island. In the year 710, Naiton, king of the Picts, wrote to Ceolfrid, Abbot of Jarrow, of his intention to build a church of stone, and desired him to send some artificers to build it after the Roman manner.

In 716, Ethelbald, king of Mercia, erected the Abbey of Croyland, in Lincolnshire, the foundations of which are described as being laid upon large wooden piles driven into the ground, solid earth, brought in boats from a distance of nine miles, being laid upon them.

In the year 767, the church of St. Peter, at York, having been damaged by fire, was taken down and rebuilt by Albert, then archbishop of that see. Albert was a learned, accomplished, and munificent prelate. He had visited Rome and other seats of learning abroad, and brought home with him a fine collection of books and relics, and various objects of art. In the re-edification of his

BASILICA OF ST. PAUL, ROME, AFTER THE FIRE, 1823.

church he was assisted by his pupils, Eanbald, who succeeded him in the see, and the famous Alcuin. The latter, in the account he has left of the church he contributed to build, describes it as a lofty pile, supported by arches on solid columns, with admirable vaultings and windows, surrounded by porticoes and galleries, and containing thirty altars variously ornamented.

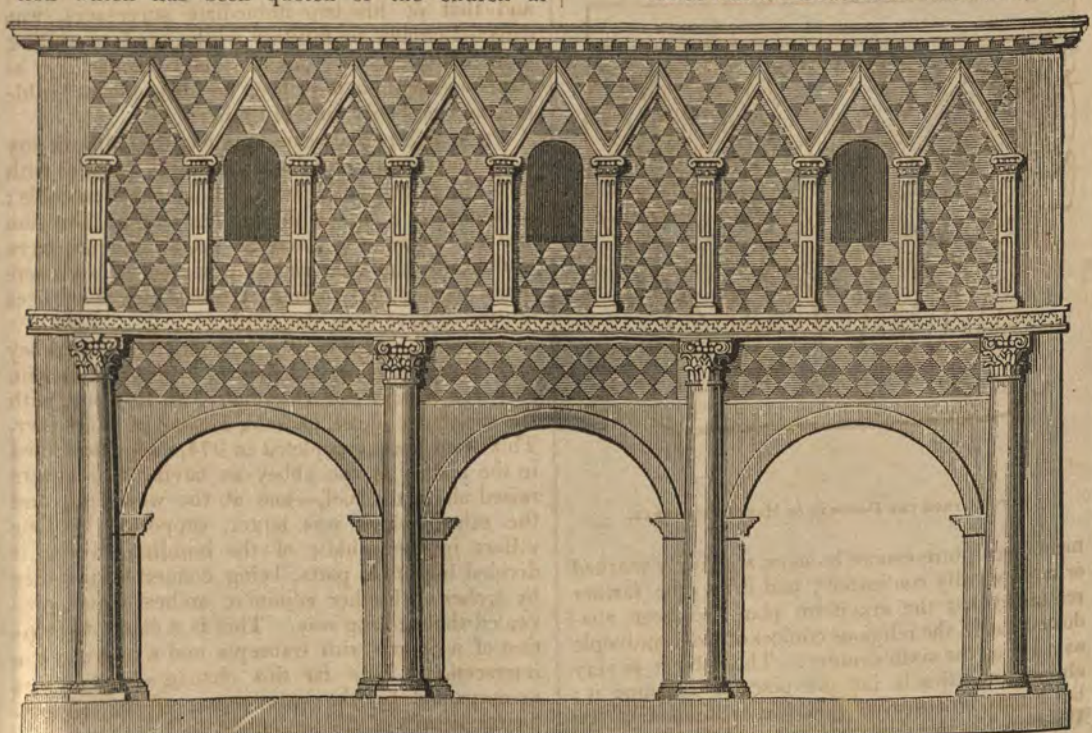
We have few notices or indications of the progress of the arts during the wars which desolated the country, with little intermission, during the ninth and tenth centuries, shortly after which the Anglo-Saxon architecture merged into that modification of the Romanesque, which, regarding the source from whence we immediately derived it, we properly term the Norman style. As the introduction of this style forms a second period of Anglo-Saxon architecture, it will be well here to take a short view of the few facts which have been collected concerning the first.

Of the buildings of the period we have gone through, not one stone remains upon another to inform us either of their character or extent, and it is only from the scanty notices of them in the chronicles and records of the time that we are enabled to judge of either. From what has been cited of this sort, we may safely infer that the architecture of the Anglo-Saxons was identical with that of the Continent, as far as the Christian religion had spread a taste for Roman art—an inference confirmed by the analogy of later styles, even down to the fourteenth century. That the larger Anglo-Saxon churches were in form as well as in name the same as the Roman Basilicas, may be inferred from the fact that they are frequently spoken of by historians as being in the Roman manner, as well as from their quadrangular form and internal porticoes, which are clearly described by Bede in more than one passage. Add to these considerations the absence of any allusion to transepts or large towers, and they are identified with the churches of the same age, of which so many remain in Italy, and some in Germany. The Basilica of St. Paul without the walls of Rome, founded by Constantine, is in its general features as close a copy of the ancient Basilica as the use for which it was designed would allow, and the degenerate age in which it was erected could produce. The interior of this magnificent church, until the year 1823, when it was nearly destroyed by fire, remained much as it was left by Theodosius the Great, who was a great benefactor to it, with

he exception of the extraneous decorations of all ages, laid upon it by the piety of succeeding emperors and pontiffs; and its style of architecture contrasted strangely with the precious materials and beautiful workmanship of the hundred columns which supported it, the plunder of many a classical edifice, and especially of the sumptuous mausoleum of Hadrian. The view even of the ruins of this church will give a perfect idea of the form and arrangement of the Basilica in general, which consisted of a nave and two lateral internal porticoes, sometimes double, sometimes single (or, as we should now say, of five or three aisles), leading to the upper end of the building, which in the ancient Basilica was occupied by the public tribunal, and in the Christian church by the high altar. But as it is not to be supposed that the Anglo-Saxons ever produced, or were capable of producing, anything upon this scale, the plan of the church of St. Grisogono, at Rome, believed also to have been founded by Constantine, will probably give a perfectly correct idea of their more important ecclesiastical structures during the period we have been considering; and that the Roman architecture had not undergone any material change upon the continent by the latter part of the eighth century, will be evident from a view of the portico to the Atrium of the church at Lorsch, near Manheim, founded in 764, and consecrated in the presence of Charlemagne in 774. This portico is undoubtedly part of the original building.

By referring to the Roman Basilica, the description which has been quoted of the church at

Ground Plan of the Church of Grisogono, Rome.



Portico at Lorsch.

Hexham becomes perfectly intelligible. It was evidently a Basilica, with an upper internal portico over the side aisles,—an arrangement described by Vitruvius in his Chapter on the Ancient Basilica, and actually existing in the Christian Basilica of St. Agnese at Rome.

In the tenth century we find a very evident change of style prevailing on the continent. The doorway of the cathedral at Mentz, founded about 978, though it exhibits the old Roman detail, some of the capitals of the columns being strictly of the Corinthian order, presents the same general form that prevailed in all gateways of the middle ages through successive changes of style,—namely, a series of recessed arches reducing the real aperture to a much smaller size than the external archway; and in the Cathedral of Worms, a little later in date, there is not only a change of plan by the distinct marking of the cross, but the style altogether approaches that of the Normans, in which, as we have already observed, the architecture of the Anglo-Saxons finally merged.

The origin of this style, which speedily became universal, may perhaps be traced to the Byzantine school. This at least is certain, that the Byzantine style of sculpture accompanies it to a great extent both in Germany and France, though rare in England. A comparison of two capitals, from works already noticed, the portico at Lorsch, and the doorway at Mentz, may serve to illustrate this hypothesis. The Roman and Greek styles of orna-

CAPITAL FROM THE DOORWAY OF MENTZ CATHEDRAL.

mental sculpture cannot be more strikingly marked or more vividly contrasted; and it may be further remarked that the cruciform plan had been shadowed out in the religious edifices of Constantinople as early as the sixth century. The subject is very obscure, and this is not the place to examine it; but it may be observed that the settlement of the Western Empire by the Franks, and the munificence of Charlemagne, had brought the arts from

CAPITAL FROM THE PORTICO AT LORSCH.

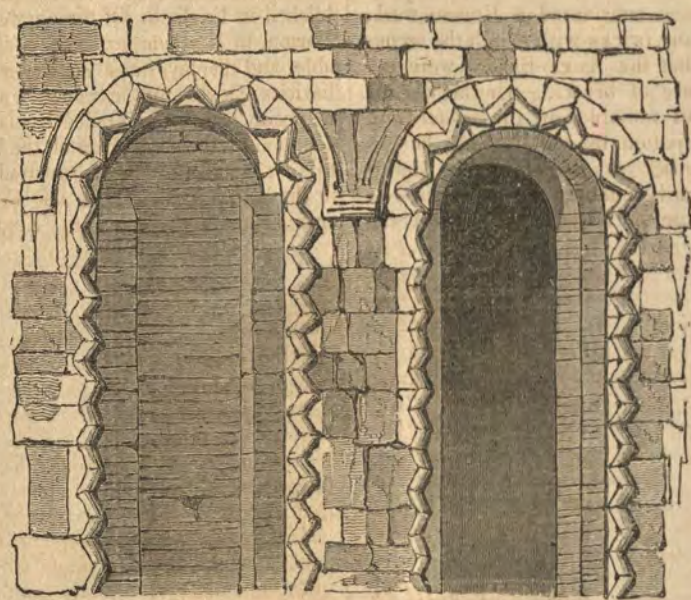
Constantinople, and even from Arabia, and that they continued to flourish under his successors, at a period when the Anglo-Saxons were struggling for their existence as a nation with their Danish invaders, and had neither means nor leisure to bestow upon the arts. During this period, when all the resources of the church and government must have been cut off or diverted to more exigent purposes, there could have been no temptation to foreign artists to settle in the country. Alfred the Great, in the interval of quiet he had won by his arms and policy, applied himself to architecture; but though he did not neglect the restoration of the ruined monasteries and churches, yet his chief care, and that of his two immediate successors, was directed chiefly to military works, and to walling and fortifying the towns. His monastery at Athelney seems to have been an insignificant building, and probably only of timber.

From this period scarcely a fact that throws any light upon architecture as an art is to be met with until the reign of Edgar, surnamed the Peaceable; in whose time, under the influence of St. Dunstan and his coadjutors, monastic establishments were multiplied, and their riches increased in an enormous degree, and numerous ecclesiastical edifices appear to have been the result.

Among these we have a description of the Abbey of Ramsey, in Huntingdonshire, founded by Ailwin, styled in history the Alderman of all England, with the assistance of St. Oswald, Bishop of Worcester. This church was completed in 974, and is described in the history of the abbey as having two towers raised above the roof,—one at the west end, and the other, which was larger, supported by four pillars in the middle of the building, where it divided into four parts, being connected together by arches with other adjoining arches, which prevented their giving way. This is a clear description of a church with transepts and a tower at the intersection. How far this change of plan was accompanied by the introduction of the characteristic details of the new style, we have no means of judging. The date is too early to suppose the alteration complete in all particulars, and a state of

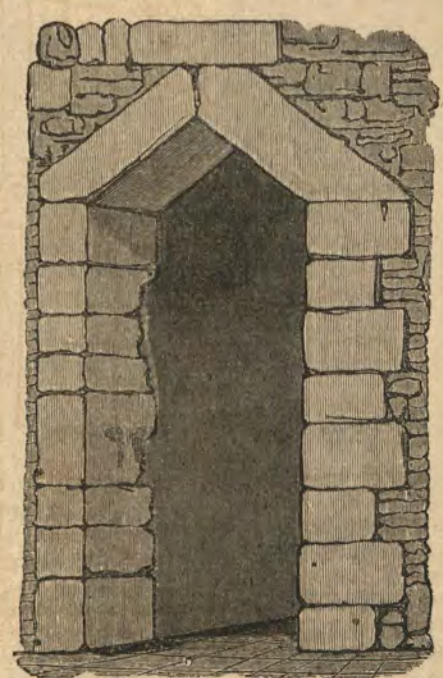
transition has been found invariably to precede every radical change at subsequent periods; but that architecture at this time was at a very low ebb, and had grievously fallen off from its former flourishing condition, may be inferred by a remark made by Wulstan, Bishop of Worcester, in 1084, upon a work of this very St. Oswald. Wulstan, who founded a new church at Worcester in that year, is said to have wept at the abandonment and demolition of the former edifice, erected about 960; and being reminded that he ought rather to rejoice at the superior extent and magnificence of the new foundation, answered,—"We destroy the works of our holy forefathers that we may obtain praise. These pious men *knew not how to construct pompous edifices*, but under any roof devoted themselves to God, and excited others by their example. We, on the contrary, heap up stones, and neglect the care of souls."

The introduction of the Norman style is undoubtedly what the historians mean by the "new manner" in which Edward the Confessor rebuilt the Abbey of Westminster. Of this style the particular description must be reserved for the next period, to which it properly belongs. The Palace of Edward the Confessor, at Westminster, was built in the same style, and its remains show it to have been a spacious and solid structure. The Painted Chamber, or, as it was called as late as the fifteenth century, St. Edward's Chamber, though its architectural character was changed by Henry III., possesses strong claims to be considered a part of the original structure, together with other apartments which have disappeared only within a few years; and this claim is corroborated by the character of the arches and triangular doorway in the vaults underneath. The apartment to which belong the ancient windows, still extant toward Palace-yard, is supposed, with good reason, to have been the great hall of the palace previously to the erection of that by William Rufus.



Windows from the Palace of Westminster.

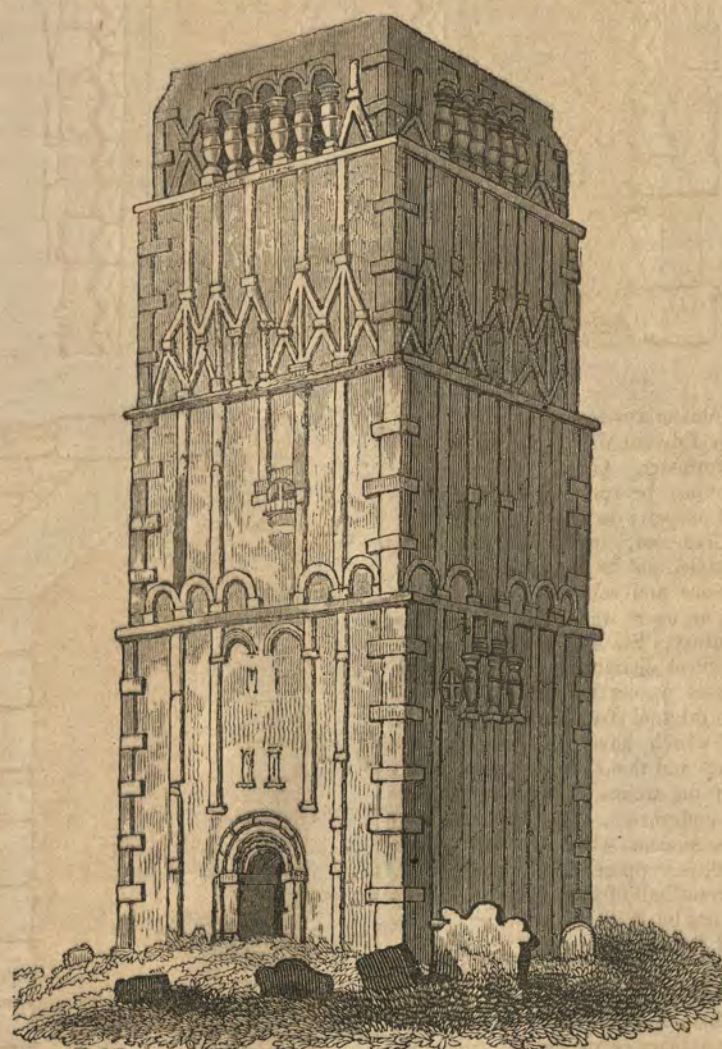
In this view of the architecture of the Anglo-Saxon period, our remarks have been chiefly confined to ecclesiastical edifices, since little remains that can be described, and the only information to be gathered on the subject is principally from historians who have written upon ecclesiastical affairs,



Doorway from the Palace of Westminster.

and whose attention has consequently been confined to ecclesiastical structures. Parish churches had become frequent early in the ninth century, since a particular canon, relating to their consecration, was enacted in the Council of Ceal-Hythe in 816. Their most general form was probably that of the smaller parish churches of later date, consisting of a simple nave and chancel, without side aisles; but that some of the smaller Anglo-Saxon churches were built with side aisles is proved by that still existing at Brixham, near Northampton. This church has been considered a Roman work, from the nature of the bricks with which the arches are turned. But that the Anglo-Saxons were acquainted with the use of bricks,—whether the art of making them had remained in the island from the time of its occupation by the Romans, or was restored with the other arts for which the Anglo-Saxons were afterwards indebted to the Latins,—is clear from a passage in Bede, who says of St. Cuthbert's hermitage, that he did not build it with squared stones, *nor with tiles and cement*, but with such materials as he could collect on the spot. The church of Brixham, however, is undoubtedly considerably older than the time of the Norman conquest. It has a square tower at the west end, with a circular staircase attached in a most inartificial manner.

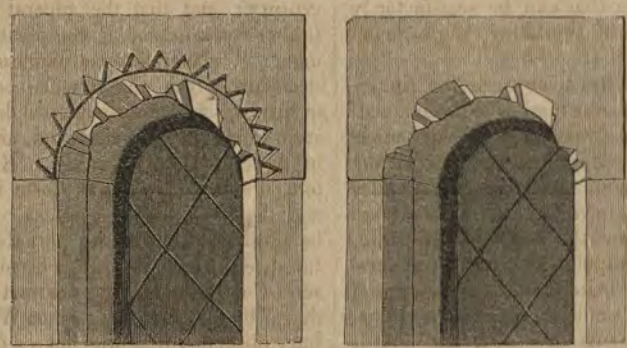
The diligence of antiquarians has distinguished a class of bell-towers, which, from their peculiar character, are reasonably presumed to be of a date earlier than that at which the Norman style was established in England. Of these towers, that of Earl's Barton, in Northamptonshire, is the most remarkable, and displays most conspicuously their peculiarities of style. Of the triangular arch we have seen a specimen in the degraded Roman style, and it is common on the sarcophagi of the lower ages; both this form, and the sort of balustrade which appears in the belfry-windows, are also to be seen in the architecture represented in Anglo-Saxon manu-



TOWER OF EARL'S BARTON CHURCH.

scripts. It is to be supposed that this tower was finished by a modillion cornice and low roof; at present it terminates with a modern battlement, which is omitted in the view. The construction of these towers is extremely massive, with rubble-work, and stone quoins and dressings, the walls being equal in some instances to the whole space inside; but they betray a low state of the art and ignorance of its principles.

The first introduction of bells among the Anglo-Saxons is involved in obscurity. Large ones were certainly rare as late as the middle of the tenth century, since William of Malmesbury reckons them among the wonderful and strange things which St. Dunstan gave to the Abbey. Bell towers are therefore probably not more than a century older than the Norman conquest. It might be possible to enumerate a few insignificant buildings, which, from something analogous in their construction, may be presumed to approach an equal antiquity, but they possess no architectural interest. The little church of Darent, in Kent, from some peculiarities of detail, may be selected as a specimen. It consists of a nave without aisles, and a chancel with a plain groined vault, destitute of any ornament, twelve feet two inches long, and thirteen feet four inches wide: the height to the springing of the arch is only seven feet.



Heads of Windows, Darent Church, Kent.

Edward the Confessor's Chapel, Westminster Abbey,—now used as the Pix Office.

The extreme rarity of any well-authenticated work older than the Conquest, is to be attributed to the demolition of the churches of any importance by the Normans, for the sake of replacing them by more magnificent structures; and though it can scarcely be doubted that they may have incorporated some of the old work with their own, yet such work can have belonged only to the latest Anglo-Saxon period, since the most critical examination has failed satisfactorily to detect the difference between the two constructions. A portion of Edward the Confessor's work at Westminster Abbey, forming vaults to the College buildings, and now used as the Pix Office, is the only part of the building that can be satisfactorily identified as a specimen of the latter Anglo-Saxon architecture.

On the DOMESTIC ARCHITECTURE of the Anglo-Saxons there is but little information to be obtained. That edifices of this class were generally of timber may be inferred from the circumstance that all the monastic buildings (which properly come under this head) of which we have any description were so constructed. Such was the Abbey of Croyland, with its infirmary and chapel, baths, hall, strangers' apartments, brewhouse, bakehouse, granaries, and stables; all of which, we learn from Ingulphus, were constructed of beams of wood, and boards most exactly joined, and most beautifully worked, by the admirable art of the carpenter, and covered with lead. The prevalent use of timber in monastic buildings may also be inferred from the often-quoted passage in King Edward's charter to Malmesbury Abbey, in which he says, "All the monasteries of my realm are to the sight nothing but worm-eaten and rotten timbers and boards." But this use of timber by no means necessarily implies a low state of art. We shall have occasion to see, in treating of later periods, that the use of timber in domestic architecture prevailed in England throughout the middle ages; that timber buildings were susceptible of a very high degree of architectural character; that they were thought worthy of being carried to a considerable extent, and of being executed with all the luxury of art as late at least as the fifteenth century; and that the general discontinuance of timber constructions is comparatively of a modern date. It is therefore not unreasonable to suppose, that during the period when ecclesiastical architecture was in a flourishing condition, the domestic style would not be neglected, though exemplified in more humble materials. King Alfred, we are told, displayed a superior taste in the construction and decoration of his palaces. It must, however, be admitted, that at the period of the Conquest, the dwellings of the Anglo-Saxons must have presented an unfavourable contrast with those introduced by the Normans; since William of Malmesbury observes, that the houses of the former were low and mean, though their way of living was luxurious and extravagant; whereas the Normans, though moderate, and even abstemious in their diet, were fond of stately and sumptuous houses,

and affected magnificence in their buildings both public and private.

On the MILITARY ARCHITECTURE of this period, there is as little to be collected. That the Anglo-Saxons walled and fortified their towns, has already appeared; and that they had the skill to do so with effect, is evident from the sieges some of them were able to sustain against the Normans. Exeter could resist the Conqueror for eighteen days, and then, says the Saxon Chronicle, "the citizens surrendered because their chiefs deceived them." Oxford, Warwick, Leicester, Derby, Nottingham, and York, were all fortified places, and made sufficient resistance to provoke the utmost vengeance of the conquering army. At Leicester there appears to have been a citadel. In the absence of any authority affording a description of the Anglo-Saxon fortresses, we may venture to suppose that such of them as might possess any architectural character or solidity of structure, bore a resemblance to those of the continent, though probably on an inferior scale. But it is useless to waste conjectures on a subject which will form an important branch of the architecture of the Norman period.

The little that is known of the state of architecture in Wales during this period, is not much calculated to excite either our interest or our curiosity to know more, since the art appears not to have advanced beyond the most primitive modes of construction. The chief palace of the kings, and place of assembly for the great council of the nation, appears to have been no better than an edifice of wattles, and was called the White Palace, from the osiers with which it was woven being peeled. This we learn incidentally from the Leges Wallicæ, in which it is enacted, that a fine of one pound and eighty pence shall be paid by whoever shall burn the king's hall or palace. Eight buildings or dependencies upon the palace are also enumerated, the destruction of each of which is valued at one hundred and twenty pence. These buildings are, the dormitory, the kitchen, the chapel, the granary, the bakehouse, the storehouse, the stable, and the dog-house.

It will be sufficient to notice very briefly the state of SCULPTURE and PAINTING during the Anglo-Saxon period. The former was necessarily practised by the idolatrous Saxons; descriptions of the forms and attributes of their deities have been handed down to us, but their efforts to represent them were undoubtedly of the lowest grade of barbarism.

The art of sculpture, such as it was in the seventh century, accompanied the introduction of Roman architecture into England, and probably underwent similar vicissitudes, flourishing and decaying from the same causes. Nothing remains which may mark its progress or exemplify its merits, except a few of the smaller works of art, among which the Horn of Ulphus, preserved at York, may be cited for its undoubted authenticity. But there must have been a demand for the images

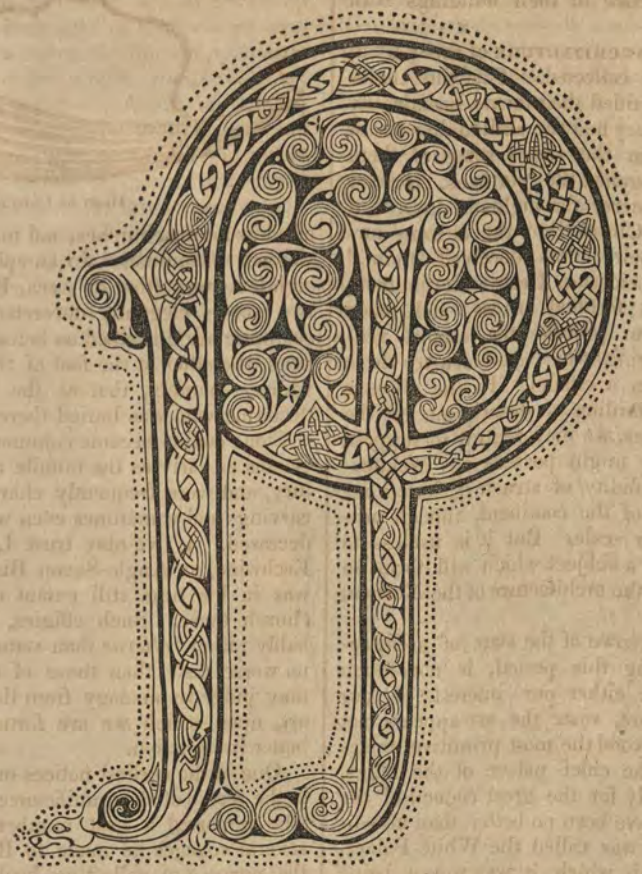
Horn of Ulphus.

of saints for the churches, and monumental sculpture was not uncommon. In an episcopal tomb of the eighth century (that of Acca, Bishop of Hexham), two crosses elegantly decorated with ornaments of sculpture are described as being set up, one at the head, the other at the foot of the tomb; on one of which,—namely, that at the head,—were letters declaring who was buried there.

Stone coffins became common among the richer classes as early as the middle of the seventh century, and were frequently charged with decorative carvings and sometimes even with an effigy of the deceased. If we may trust Leland, the figure of Eschwine, an Anglo-Saxon Bishop of Dorchester, was in his time still extant on his tomb in the church there. Such effigies, however, were probably rather *relievos* than statues, and perhaps in no worse taste than those of other nations, if we may judge by analogy from the state of the sister art, upon which we are fortunately possessed of better information.

One of the earliest notices on the art of painting is the record of the munificence of Benedict Biscop, who imported a vast number of pictures in the several voyages he made to Rome, principally for the purpose of collecting books, relics, and ornaments for the churches he had founded at Wearmouth and Jarrow. These pictures, which were not merely effigies of the saints and apostles, but, as Bede informs us, comprehended the whole Gospel history, with the concord of the Old and New Testaments, must have been of the Byzantine school, to which, at this period, and long after, artists of all countries looked for instruction.

But whatever improvement the Anglo-Saxons may have derived from an acquaintance with Greek art or the instructions of foreign artists, an independent school for the illumination of manuscripts appears to have existed in Ireland as early as the sixth century; and the perfection to which the Anglo-Saxons had arrived in this branch of painting at the beginning of the eighth is sufficiently proved by many existing manuscripts, particularly that celebrated by the name of the "Durham Book," or "St. Cuthbert's Gospels," the work of Eadfrid, Bishop of Lindisfarne, who came to that see in 698, and died in 721. In this splendid example of Anglo-Saxon art the figures certainly bear strong marks of the Byzantine style of drawing, but the design and execution of the illuminated capitals are original, and such as are not to be found in the works of any continental school. The chief features of this species of illumination are described by Sir F. Madden to be, extreme intricacy of pattern



ANGLO-SAXON ILLUMINATED LETTER. From MS. of the Eighth Century.

ANGLO-SAXON ORNAMENT. From MS. of the Tenth Century.

interlacings of knots in a diagonal or square form, sometimes interwoven with animals, and terminating in heads of serpents or birds. Though we cannot distinctly trace the progress of this art, we may conclude that it continued in a flourishing and improving state in the interval from the eighth to the tenth and eleventh centuries, which were so prolific in Anglo-Saxon works of calligraphy and illumination, that perhaps, says a competent authority speaking of this period, our public libraries and the collections abroad contain more specimens executed in this country than any other can produce during the same space of time.

This art, like all others, flourished in the cloister. The greatest dignitaries of the church not only encouraged but practised it, and a specimen is extant in the Bodleian Library by the hand of no less a personage than St. Dunstan. St. Ethelwold, Bishop of Winchester, was a great patron, and perhaps also a professor of the art; and the names of Ethric and Wulfric, monks of Hyde Abbey, are recorded with the additional designation of "painters," in a manner which shows such artists to have been persons held in the highest respect and estimation. New Minster, or Hyde Abbey, at Winchester, appears to have been one of the principal schools

of illumination, and many of the finest manuscripts of the period are known to have been produced there. The magnificent Benedictional of St. Ethelwold, the execution of which is attributed to the monk Godewin, may be especially referred to, and is the more remarkable and honourable to our native talent, as being the work of an age when the arts were generally, and particularly in Italy, in the most debased condition. The paintings exhibit much of the Greek character, which may arise from the use of a standard set of designs originally emanating from that school, particularly as the scriptural subjects represented are treated in nearly the same manner in different manuscripts. But with the exception of the naked parts, in which the ignorance of the period is most conspicuous, the drawing displays no little proficiency: the draperies especially are full of grace and intelligence; and the decorations, which are in a style altogether peculiar to the Anglo-Saxon school, exhibit bold and rich masses of foliage not to be surpassed either in composition or execution by any contemporary productions of the same class. The well-known manuscript of the sacred poem of Cædmon is also supposed to have issued from the New Minster school about the year 1000. The drawings are curious, rather than of any value as works of art; but it contains some very remarkable initials, composed by the interlacing of foliage with birds, serpents, &c.

Anglo-Saxon Illuminated Letter. From MS. of the Tenth Century.

There is little on record concerning the more extensive branches of the art. Stubbs, in the Actus Pontificum Eboracensium, speaks of a magnificent "heaven" executed in gold and colours under Archbishop Aldred shortly before the Conquest. This may have been mere decoration painting,—stars on a blue ground, &c.; though the term generally implies something more.

In the arts of design it will be proper to include embroidery, in which the Anglo-Saxon ladies were reputed eminently skilful. The four daughters of Edward the Elder excelled in spinning, weaving, and needle-work; and St. Dunstan himself condescended to draw a pattern for a sacerdotal vestment which a religious lady of the tenth century executed in threads of gold. In the same century a drapery on which were represented the actions of Brithnod, Duke of Northumberland, was presented by his widow Edelfleda to the church of Ely; and at an earlier period Witlaf, king of Mercia, in a charter to the Abbey of Croyland, gives, among other things, a golden veil embroidered with the siege of Troy, to be hung up in the church on his birth-day.

Music, before the invention of the present mode of notation by Guido of Arezzo in the eleventh century, and the other improvements introduced about the same epoch or soon after, may seem to be scarcely entitled to the name of a science, if compared with what it is in its present state. Yet, although confined to melody merely, music was certainly cultivated with much ardour in this country from a somewhat early date in the Anglo-Saxon period. The Anglo-Saxon music of which the fullest and most distinct notices have come down to us is the church music. St. Ambrose, in the fourth century, has the credit of having first introduced singing into the Christian services of the West; and his method (of the peculiarities of which, however, nothing appears to be known) continued in general use till the latter part of the sixth century, when it was reformed by Pope Gregory the Great. The Gregorian chant may be presumed to have been brought over to this country along with the Christian religion, by St. Augustine and his companions, and it was this mode of singing most probably of which they gave a specimen at the first audience granted them by King Ethelbert, and on

their solemn procession immediately afterwards into the city of Canterbury.* The musical service, however, seems to have been confined to the metropolitan church, or at least to the district of Kent, till the time of Archbishop Theodore, in the latter part of the seventh century. Some are disposed to attribute to Theodore and his friend Adrian the first introduction into England of the Gregorian chant: it is admitted on all hands that it was to their exertions that the general diffusion of a knowledge of the improved chant was owing. Bede relates that, in 678, one John was sent from Rome by the Pope to teach music to the English clergy, and that he both gave instructions in the art during his stay and left behind him written directions for its study. Accordingly, to quote the account as it stands in Holinshed, "whereas, before time, there was in manner no singing in the English churches, except it were in Kent, now they began in every church to use singing of divine service after the rite of the church of Rome." "The Archbishop Theodore," the chronicler proceeds, "finding the church of Rochester void by the death of the last bishop, named Damian, ordained one Putta, a simple man in worldly matters, but well instructed in ecclesiastical discipline, and namely (especially) well seen in song and music to be used in the church after the manner as he had learned of Pope Gregory's disciples." Putta indeed would appear, from the sequel of his story, to have been intended by nature rather for a singing-master than a bishop. His church of Rochester having been spoiled and defaced a few years after, in a hostile incursion made into Kent by the Mercian King Ethilfred, he went, we are told, "to Servulf, Bishop of Mercia, and there obtaining of him a small cure and a portion of ground, remained in that country, not once labouring to restore his church of Rochester to the former state, but went about in Mercia to teach song, and instruct such as would learn music, wheresoever he was required or could get entertainment."† Some time after this a chief seminary of music was established at Canterbury, and other permanent schools also in the other monasteries.

TROMBONES, OR FLUTES. From the Cotton MS. Cleopatra, C 7.

Nor were the Saxons by any means without instrumental music. Among their musical instruments, besides bells, we find mention made of the horn, the trumpet, the flute, the drum, the cymbal, the rota, or viol, the lyre, and the harp. Representations of most of these are found among the illuminations of their manuscripts. They also seem to have been acquainted with the organ. Mr. Turner has produced a passage from Aldhelm's Latin poem in praise of virginity, and another from a work of Bede's, in both of which the organ is mentioned; and William of Malmesbury describes an organ as existing in his own church, which bore an inscription stating that it had been presented by St. Dunstan, who, the historian elsewhere tells us, gave many great bells and organs to the churches of the West. These Saxon organs, according to Malmesbury, had brass pipes and bellows. The drum is described by Bede as formed of tense leather. The Saxon lyre is represented in the illuminations with four strings, struck by a plectrum. The harp is depicted in some instances of the modern triangular form, in others square or oblong-shaped. In one manuscript the Psalmist David is represented playing on one of the latter fashion, which has ten strings; he plays with the fingers of his right hand, and holds the instrument with his left.

DAVID PLAYING ON THE HARP. From the Cotton MS. Tib. C. 6.

In another instance, the royal psalmist has a triangular harp of eleven strings; and he is accompanied by three other musicians, one with a straight trumpet, supported in the middle by a pole; another with a curved horn; and the third with a sort of violin, on which he plays with a bow. Bede tells us, in his History, that the harp was in

* See ante, p. 232.

† Holinshed's England, b. v. ch. 35.

The Harp, accompanied by other Instruments.
From the Cotton MS. Tib. C 6.

common use among his countrymen on all festive occasions; when the custom was for it to be handed round the company, that all might sing and perform in turn. The art of playing on this instrument appears to have been practised professionally by wandering minstrels or gleemen, and to have been also a fashionable accomplishment of the highest and best educated classes. The reader will remember the story that is told of Alfred on one occasion disguising himself as a minstrel, and in that character finding ready admission to the camp of the Danes, with his harp in his hand.* A similar story is related of a visit paid by Anlaff, the Danish king or earl of Northumberland, to the camp of the Saxon Athelstane, on the eve of their famous encounter at Brunanburgh. Dunstan also, it will be remembered, was celebrated, among his other accomplishments, for his skill as a harper.

The harp, and the popular music generally, of the Saxons, were in all probability borrowed from the Irish, among whom the art appears to have flourished from the remotest antiquity, and to have been carried, at an early period, to a perfection elsewhere unknown. Some of the most learned of the Welsh antiquaries have admitted that their national music is of Irish origin; and there can be little doubt, from the character of the Scottish melodies, that they also have been derived from the same source. Even to the Italian music an Irish extraction has been assigned, and by Italians themselves. The harp, called in Celtic the *cruit*, is noted in the oldest records, as well as in the traditions of the people of Ireland, as the favorite instrument of their bards from the earliest times. The most remarkable foreign testimony, however, to the musical skill of the Irish is that of Giraldus Cambrensis in the twelfth century. Their eminence in instrumental music he describes as beyond comparison superior to that of any nation he had known. Their modulation, he adds, "is not slow and solemn, as in the instruments of Britain, to which we are accustomed, but the sounds are rapid and precipitate, yet at the same time sweet and pleasing. It is wonderful how, in such precipitate rapidity of the fingers, the musical proportions are preserved; and how, by their art, faultless throughout, in the midst of their complicated modulations, and most intricate arrangement of notes, by a rapidity so sweet, a regularity so irregular, a concord so discordant, the melody is rendered harmonious and perfect." So famous, also, was the church music of the Irish at an early period, that the daughter of Pepin of France, in the seventh century, is recorded to have sent to Ireland for persons qualified to instruct the nuns of the Abbey of Nivelle in psalmody.†

* See ante, p. 159.

CHAPTER VI.

THE HISTORY OF MANNERS AND CUSTOMS.

OUR knowledge of the miscellaneous particulars coming under this head in the present period is much more extensive, as well as more distinct and certain, than that which we possess of the manners and customs of the ancient Britons, but it is still far from being perfectly satisfactory. We have indeed many Anglo-Saxon writings, from which a good deal of authentic information may be gleaned respecting various parts of the subject; but the information thus preserved consists, after all, only of incidental notices, which are often so brief or so allusive as to admit only of a conjectural interpretation, and which leave many things which it would be important for us to know altogether untold and untouched upon. No work professing to present a view of their domestic and social usages, their popular pastimes and superstitions, the accommodations of their dwelling-houses, their dress, and their mode of living in general, has been bequeathed to us by our Saxon ancestors. We are left to gather what hints we can respecting all these matters from records drawn up with no view of affording us any such instruction,—from their chronicles of transactions in church and state, from their laws, from their works of science and learning, from their homilies, from their almanacs, from their wills, their grants of land, their leases, and other charters and legal documents. But perhaps the richest of all our now remaining sources of information respecting all the minor details of the social condition of the Anglo-Saxons has been furnished us by what we may call their national art of illumination. The drawings on their manuscripts, originally intended merely for embellishment, and still in a high degree interesting and estimable as works of art, have now acquired a new value, as preserving distinct representations of many things of which no intelligible verbal description has come down to us, and of some of which perhaps the very memory would otherwise have been lost. Of the industrious arts, as well as of the popular customs of this period, the fullest and clearest record that has been transmitted to us is literally a pictorial history. In the present chapter, as in that upon the National Industry, we shall draw liberally from this source, both in the illustrations and in the text.*

Having already given an account of the houses of the Anglo-Saxons, in so far as regards their architecture, we shall now proceed to describe their furniture as far as our materials enable us. The dwellings of the higher classes appear to have been completely and sometimes splendidly furnished: their walls were hung with silk richly embroidered with gold or colours. The needle-work, for which the English ladies were so famous, was herein displayed to great advantage. Ingulphus mentions some hangings ornamented with golden birds in needlework, and a veil or curtain on which was represented in embroidery the destruction of Troy. In the Anglo-Saxon poem of Beowulf we read that, in "the great wine-chamber"—

> "There, shone variegated with gold
> The web on the walls,
> Many wonders to the sight
> Of each of the warriors
> That would gaze on it became visible."

The Saxon term for a curtain or hanging was *wahrift;* and, in the will of Wynflœda, we find the bequest of a long *heall wahrift* and a short one. The same lady also bequeaths three coverings for benches or settles (*setl-hrægl*). Pedalia, or foot-stools, are mentioned by Ingulphus, the larger ones covered with woven lions, and the smaller sprinkled with flowers. A common form of the Saxon chair

CHAIRS. From Cotton MS. Claud. B 4.

* It is proper to state, that although some of the ancient drawings presented in the present work have been before engraved in Strutt's Horda Angel-Cynnan, Regal and Ecclesiastical Antiquities, Chronicle of England, &c., and in other expensive publications, the representations here given have, with few exceptions, been traced or otherwise copied from the originals, and with scrupulous fidelity.

Chairs. From Harleian MS. No. 603.

An Elevated and Richly-Ornamented Seat. From Cotton MS. Tiberius, B 5.

or bench, as may be seen from several cuts already given, appears to have somewhat resembled that of our modern camp-stool, consisting of a seat held in tension by two or more crossing bars. Chairs, however, or seats with backs to them, are occasionally met with in Saxon illuminations, and, as well as the benches and stools of various descriptions, are generally ornamented at their extremities with the heads and feet of lions, eagles, griffins, &c. These were commonly formed of wood, and carved, but occasionally of gold and silver, or were at least highly ornamented with those precious metals. Their tables were sometimes made of the same costly materials. In the reign of Edgar a table is

Saxon Tables. From Harleian MS. No. 603.

said to have been made of silver, by an artist named Æthelwold, which was of the value of 300*l.** In the illuminated MSS. we perceive tables, both oblong and oval, covered with table-cloths, and furnished with knives, spoons, drinking-horns and cups, bowls and dishes, but no forks. That they had gold and silver plate in abundance, and of the most costly description, we have ample evidence in the wills of Wynflœda, Wulfur, and Brithric, and similar documents. Wulfur bequeaths four cups, two of which are described as of 4*l.* value.† A lady on one occasion makes a gift of a golden cup weighing four marks and a half;‡ and the King of Kent sent to Boniface, the Anglo-Saxon missionary in Germany, a silver bason, gilt within, weighing three pounds and a half.§ Two silver cups, weighing twelve marks, are mentioned as used by the monks in a refectory to serve their drink.‖ A king in the ninth century is recorded to have made a present of his gilt cup, engraved on the outside with vine-dressers fighting dragons, which he called his cross-bowl, because it had a cross marked within it and four angles projecting like a similar figure;¶ and in other places we read of golden and silver dishes, and a dish adorned with Grecian workmanship.** Those of the commonalty were of brass, of wood, of horn, and of bone. Cups and dishes of horn were forbidden to be used in the sacred offices.†† But drinking-horns were much used at table, and some of them were richly carved and ornamented. Witlaf, King of Mercia, gave the horn of his table to Croyland monastery, "that the elder monks might drink thereout on festivals, and in their benedictions remember sometimes the soul of the donor."‡‡

The delivery of a drinking-horn, at least under the Danish kings, was a mode of conveying landed property. The estate of Pusey, in Berkshire, is still held by the possession of a horn, by the delivery of which it was granted by Canute to an officer of his army, who, according to tradition, had made his way in disguise into the camp of the Saxon enemy, and there obtained information of a plot laid to surprise the Danes. The Pusey horn was most probably the drinking-horn of Canute. It is an ox horn, of a dark-brown colour, about two feet in length, and a foot in circumference at the rim. At the small end is a hound's head of silver gilt, made to screw in as a stopper; and, by taking out this, it might be made to serve as a hunting-horn, a use of it which appears to be indicated by two rings, one at the mouth and another at the middle, with which it is furnished, as if for a strap or belt to go through. Upon a broad silver ring, encompassing the middle of the horn, and by which it is supported on a stand, is the following inscription, which, however, is comparatively modern:—

"Kyng Knowde geve Wyllyam Pewse
This horne to hold by thy lond."*

THE PUSEY-HORN. From the Archæologia, vol. iii.

FAC SIMILE OF THE INSCRIPTION ON THE PUSEY-HORN.

Glass vessels were rarities in the early periods, but became more common towards the Norman Conquest. A disciple of Bede inquired of Lullus, in France, if there were any man in his parish who could make glass vessels well; and desired in such case that he might be persuaded to go to England, as its people were "ignorant and helpless in the art."† Bede, however, mentions glass lamps and vessels for many uses.‡

They had silver candelabra and candlesticks of various descriptions.§ Lanterns of horn, as already mentioned, were also used. A silver mirror is mentioned in Dugdale, and hand-bells were used to summon the attendants.‖

In an illuminated MS. we have a representation of an Anglo-Saxon bedstead. It has a roof like that of a house to it, and is furnished with curtains, pillow, &c. In the Anglo-Saxon poem of Judith the bed of Holofernes is described as hung with a "golden fly-net." In various wills we read of beds, pillows of straw, bed-clothes, curtains, sheets, &c.¶ Skins of animals were sometimes used as coverlids. A goat-skin bed-covering is mentioned as presented to an Anglo-Saxon abbot.** The terms *sæcking* (sacking) and *lang bolster* also occur in Saxon works. In the poem of Beowulf we are told that when the evening came on, the tables were taken away, and the place was spread with beds and bolsters, by which it would appear that the warriors slept in the same halls in which

they had feasted. "The beer-servants," continues the bard,

> "Speedy and joyful,
> Prepared the chamber of rest.
> They fixed over their heads
> The shields of Hilda,
> The boards of bright wood.
> There, high over the Etheling on his bench,
> The helmet of the noble one was seen,
> His ringed coat of mail,
> His glorious wood of strength." (*i. e.* his spear.)

Thus, whether seated at the banquet-board or stretched on his couch, the arms of the warrior ornamented the wall above his head, ready to be grasped at the first alarm.*

* His coverlid was frequently nothing but his cloak, for Charlemagne, deriding the short cloaks then in fashion, remarks, amongst other things, "We cannot be covered by them in bed."—Monk of St. Gall.

Saxon Beds. From the Harleian MS. No. 603.

Wheel Bed. From the Cotton MS. Claud. B 4.

Not to enter a warm-bath or a soft bed was enjoined by what they called their deep-like or severe penance.* For culinary purposes they possessed boiling vessels,† and ovens for baking meat and bread. In one of the manuscripts is an illumination, representing men killing and dressing meat. One of them has put a stick, with a hook at the end, into a cauldron which stands upon a four-legged trivet, within which the fire is made. In the same MS., also, we perceive that the roast meats are brought up to table by the servants upon the spits,

the guests cutting off such portions as pleased them. This continued to be a custom amongst the Normans, as we find by the Bayeux Tapestry.

Not one of the least important parts of the history of manners and of civilization is the history of costume. The dress of a people is always in some degree an indication of the progress they have made in wealth as well as in taste, and in the useful as well as in the merely elegant arts. Nor can we call up in imagination any lively picture of a past age without a knowledge of its prevailing forms of attire, and of the distinctions in this respect that marked the different classes of the community. An ignorance of this subject will prevent us from entering perfectly into a feeling of the spirit of the period and of the condition of society in regard to matters in themselves of much more consequence; and false notions here may falsify our conceptions as to many other things.

The history of British costume properly commences with the Anglo-Saxon period. We have no pictorial authority for the costume of the Anglo-Saxons earlier than the eighth century; but Paulus Diaconus, who wrote during the latter half of that

ROYAL COSTUME. From a Picture of Harold and the Magi in the Cotton MS. Nero, C 4.

ROYAL COSTUME, AND THE HARNESS AND EQUIPMENT OF HORSES. From a Picture of the Magi, leaving the Court of Harold, in the Cotton MS. Nero, C 4.

century a history of the Lombards, describes a painting of the sixth century which he had seen in the palace of Theodelinda, queen of the Lombards, in Italy, said to be painted by her command, and representing some of the exploits of her countrymen, whose dress the historian expressly states to have been the same as that of the Anglo-Saxons. "Their garments," he tells us, "were loose and flowing, and chiefly made of linen, adorned with broad borders, woven or embroidered with various colours." His description perfectly agrees with Eginhart's elaborate account of the costume of Charlemagne, and also with the dresses depicted in the illuminated MSS. of the eighth and ninth centuries; and that they continued to wear some ancient habits at that period is tolerably evident from the reproach addressed to them by the council of Cealchyth in A.D. 787: "You put on your garments in the manner of pagans, whom your fathers expelled from the world; an astonishing thing that you imitate those whose life you always hated." From the eighth to the tenth century we have, however, abundant authority for the civil, military, and ecclesiastical costume of the Anglo-Saxons, both in the notices of the writers of the time, and especially in the numerous miniatures with which the MSS. are ornamented. From their concurring evidence we find that the undermost part of the male attire consisted of a linen shirt, above which they wore a tunic of linen or woollen, according to the season, descending to the knee, and plain or ornamented round the collar and borders, according to the rank of the wearer. It was open at the neck, and sometimes at the sides, and had long sleeves reaching to the wrists, sometimes tight, at others, set in close rolls or wrinkles from the wrist to the elbow. It was generally confined by a girdle or belt round the waist. Its Saxon name was *roc* or *rooc*. Over this was worn a short cloak (*mentil*), fastened sometimes on the breast

Ornamented Tunic. From Cotton MS. Claud. B 4.

and sometimes on the shoulder, with brooches or fibulæ. Linen drawers, and stockings (called *brech-hose*) of linen or woollen, the latter frequently bandaged from the ankle to the knee with strips of cloth, linen, or leather, were worn by the better orders, and shoes of some description by all, as even the common labourers, who are generally depicted bare-legged, are rarely seen barefooted.* The Saxon shoe (*sceo* or *scoh*) is generally painted black, and drawn with an opening down the instep, secured by two thongs.† They also wore a sort of short boot or buskin; and a half-stocking or sock (probably what they called socca) is sometimes seen worn over the hose instead of the bandages.‡

* To go barefooted was a penitentiary injunction. Upon the landing of one of the great Danish armies, a general penance for three days was ordered, and every man commanded to go "barefoot to church, without gold and ornaments." MS. C C Cantab. apud Wanley, p. 138.

† In the Life of St. Neot he is said to have lost his scoh (shoe), and to have seen a fox having the "thwanges" of it in his mouth. Cotton MS. Vespasian, D xiv. p. 144.

‡ Soccas and hosan are mentioned in St. Benedict's rules, Cotton MS. Tib. A 3; also two other coverings for the legs and feet called neon and fiand reaf fota, and the earm slife for the upper part of the body.

Saxon Cloaks, Plain and Embroidered Tunics, and Shoes. From Cotton MS. Claud. B 4.

The practice of bandaging or cross-gartering the hose was followed by the Franks, whose costume, as well as that of the Lombards, was very similar to that of the Saxons. The Monk of St. Gall says, that "over their stockings or drawers they wore fillets bound crosswise in such a manner as to keep them properly upon the legs." Such bandaged hose were worn as late as the sixteenth century by the butchers in France, and called *les lingettes*.* The Saxon name appears to have been *scancbeorg*, literally shank or leg guard. A similar fashion still exists amongst the people of the Abruzzi and the Apennines, and in some parts of Russia and Spain. The bandages are sometimes depicted as gilt on the legs of regal personages, as are also the shoes and buskins of princes or high ecclesiastical dignitaries. Theganus, in his life of Louis le Débonnaire, son of Charlemagne, describes his buskins as being of gold stuff or gilt (*ocreas aureas*). The hose are commonly represented either red or blue. Coverings for the head are rarely seen except upon the figures of warriors. The cap, therefore, seems to have been the helmet, and its shape is either conical or of the ancient Phrygian description. Indeed, the whole of the Anglo-Saxon costume, whether civil or military, curiously resembles the Phrygian. Silk, which was known as early as the eighth century, and purple cloth, formed the mantles of sovereigns and princes; and golden tissues, and embroideries in gold, silver, and silks of various colours, were also worn from the eighth to the tenth century by persons of high rank.† Furs were also used for the lining and ornamenting of garments. Those of sable, beaver, and fox, by the richer classes, and the skins of cats and lambs by the poorer or more economical. The ornaments of the male sex consisted of bracelets, brooches, and fibulæ of gold, silver, and ivory; chains, crosses, and rings of gold and silver, sometimes beautifully enamelled; belts of gold and silver studded with jewels, and headbands or diadems of the same magnificence. The hair, when worn long, was parted on the forehead, and suffered to fall naturally down the shoulders. The beard was ample, and generally forked. The fulminations of the clergy against long hair may be supposed occasionally to have produced some effect for a short period, as we find in some illuminations the hair cropped and the face shaven.* The old Teutonic passion for long, flowing ringlets, however, was never totally eradicated. The barbaric custom of tatooing, or puncturing the skin, was practised by the Anglo-Saxons as well as by the Britons, and a law was passed against it A.D. 785; but it was nevertheless continued during the whole of the Anglo-Saxon period, and is amongst the English vices reprobated by William of Malmesbury after the Norman Conquest.

COSTUME OF FEMALE, EXHIBITING THE UNDER AND UPPER SLIEVED TUNIC, THE MANTLE, AND HOOD. From Harleian MS. No. 2908.

The female costume of this period appears to have consisted generally of a long and ample garment with loose sleeves (probably that called the *gunna* or gown),† worn over a closer-fitting one (either the tunic or the *kirtle*),‡ which had tight sleeves reaching to the wrist, shoes similar to those worn by the male sex, and a head-dress formed of a veil or long piece of linen or silk wrapped round the head and neck, called in Saxon *heafodes rægel* (head rail), or *wæfles*, derived from *wæfan*, "to *cover*." The mantle also formed part of the dress of the superior classes, and in some of the illuminations it resembles the ecclesiastical vestment called a chasuble. We may presume that the socca or some other sort of hose was worn by the women as well as by the men; but the length of

* In the fourth century, we are told they cut their hair so close that the head appeared diminished and the face enlarged. Sid. Apollinarius.
† A Bishop of Winchester sends as a present "a short gunna, sewed in our manner." Mag. Bib. Pat. xvi. 82. But that it was the exterior garment that was so called is evident from another passage in the same work, where a gunna is stated to have been composed of otter's skin, p. 88. In Scotland an upper garment worn by women, which comes down only to the middle, is still called a short-gown (with a strong emphasis on the first syllable).
‡ Will of Wynfleed. Vide Preface to Hickes's Anglo-Saxon Grammar, p. 22.

the tunic prevents our observing them in the illuminations. Notwithstanding the universal appearance of the head-rail, we find that the Anglo-Saxon ladies paid great attention to the dressing and ornamenting of their hair. Adhelm describes the twisted locks of a lady as being delicately curled by the iron of those adorning her; and Judith, in the Anglo-Saxon poem so called, is apostrophised as the "maid of the Creator, with twisted locks." Adhelm also describes the wife as loving to paint her cheeks with the red colour of stibium.

Canute and his Queen. From the Register of Hyde Abbey. Engraved in Strutt's Horda Angel Cynan.

Cuffs and ribands (*cuffian* and *bindan*) are mentioned in the will of an Anglo-Saxon lady, and an engraved *beah* or bracelet. In other Anglo-Saxon documents mention is made of a golden fly beautifully adorned with gems, of golden vermiculated necklaces, of a bulla that had belonged to the grandmother of the lady spoken of, golden headbands, ear-rings, a neck cross, and of golden ornaments called *sylas*.

Gloves appear to have been very rare amongst the Anglo-Saxons. In one illumination only have we seen the hand covered except by the sleeve of the gown or tunic, and in that instance it is by a species of muffler, having a thumb, but no separate fingers. Amongst the representations of male figures they are never met with; but from a law of Ethelred the Unready, quoted in a preceding chapter, it may be inferred that, at the close of the tenth or beginning of the eleventh century they were great rarities—five pair forming a considerable part of the duty paid by a society of German merchants for the protection of their trade.

Of the royal costume among the Anglo-Saxons perhaps the most distinct representation to be found is that furnished by the drawing in one of the manuscripts, of King Edgar seated on his throne.

King Edgar. From the Cotton MS. Tib. A 3.

To this we may add some representations of the costume and ornaments of the ecclesiastical order.

Golden Cross. Worn by St. Cuthbert, and found on his body at the opening of his Tomb in 1827.

The military costume of the Anglo-Saxons on their first appearance in Britain is exceedingly uncertain. The Welsh bard Aneurin, who flourished in the sixth century, and fought in person against the invaders, describes them as being armed with "daggers, white-sheathed piercers, spears, and shields, the latter being made of split wood, and four-pointed or square helmets." He says "their leader was armed in scaly mail, carrying a projecting shield, a slaughtering pike, and wore (as a mantle perhaps) the skin of a beast." His mention of the square or four-pointed helmet is a circumstance which goes to confirm the credit of his narration, as that singular head-piece is to be seen both in Frankish and Anglo Saxon illuminations.* The Saxons who invaded Thuringia in the same century are described by Wittichind as leaning on small shields, bearing long lances, and wearing

Costume of a Soldier. From Cotton MS. Tib. C 6.

* The regal diadem of the Franks and Anglo-Saxons is also occasionally depicted quadrangular. Vide Plates in Strutt and Montfaucon, Mon. Franc.

great knives or crooked swords by their sides. But Wittichind wrote at the close of the tenth century, and Mr. Sharon Turner, who quotes this passage, remarks, in another part of his work, that Wittichind, though a Saxon himself, appears to have been completely ignorant of Saxon antiquities.*

Alcuin and Adhelm, both writers of the eighth century, are the first who afford us any authority on which we may rely for the military dress of the Anglo-Saxons. The former tells us that the short linen tunic was preferred to all other vestments as the one in which they could most freely wield their weapons; and from the composition by the latter, entitled his Ænigma, we find that some description of metal armour, if not the *gehringed byrne*, or tunic of iron rings, derived from the East, and Latinised (indiscriminately with other armour) *lorica*, was known at the same period. "I was produced," runs the Ænigma, "in the cold bowels of the dewy earth, and not made from the rough fleeces of wool: no woofs drew me, nor at my birth did the tremulous threads resound: the yellow down of the silkworms formed me not: I passed not through the shuttle, neither was I stricken with the woolcomb; yet, strange to say, in common discourse, I am called a garment. I fear not the darts taken from the long quivers." This testimony is in favour of the descriptions of Aneurin, who speaks of "loricated bands" and "scaly mail." The latter, the *lorica squamata*, which the Romans derived from the Sarmatians, and which was known to and worn by so many nations of the East, may very probably be supposed to have been worn by the leaders of the Saxon host. The scales or rings were sewn in rows upon an under garment of linen or leather. Phrygian warriors are often depicted so arranged; and Pausanias describes a Sarmatian lorica, with the scales made of thin slices of horses' hoofs, which he saw and inspected in the Temple of Esculapius at Athens.† The improvement of connecting the rings one with the other, so as to make a tunic of them, independent of their leather or linen foundation, is ascribed by most antiquaries to a period as late as the reign of Edward I. There are some expressions, however, that occur in an Anglo-Saxon poem of the tenth century, which seem to prove that such defences were then in use; and the "*lorica*" of Adhelm being called *a garment* at the same time that he expressly denies the assistance of wool, linen, or silk in its composition, would lead to the inference that it was a vestment *complete in itself*, which could only arise from its being formed of linked rings, or scales or plates of metal riveted one to the other. The expressions alluded to are such as

> "Their battle-mail shone
> By hard hands *well locked*.
> The *shining iron rings*
> Sung against their weapons
> When they to the palace
> In their formidable apparel were delighted to go."
> * * * * *

* Hist. Anglo-Saxons, vol. i. p. 236.

† Lib. i. p. 50, Edit. Kuhn. The Sarmatians are also represented with such coats of mail on the Trajan Column.

"Beowulf addressed him;
The mail shone upon him;
The heavy net was linked
By the smith's care."*

The "locking and linking of iron rings" by "hard hands," or "the smith's care," and the mail forming "a heavy net," are phrases which may authorise us to believe that the *gehringed byrne* of the Saxon was occasionally, and at least as early as the tenth century, nearly the same as the hawberk of single-chain mail of the thirteenth.

Be this, however, as it may, the chiefs only could afford so expensive an equipment. The linen tunic was the general garb of the Anglo-Saxon soldiery, to which was occasionally added a border or collar of metal, as a thorax or pectoral, as we find it alluded to by the term of *breost-beden*, or *breost-beorg*, literally, breast-defence, or breast-guard. The helmet, originally of the Phrygian shape, was made of leather, sometimes bound or bordered with metal. It had sometimes a serrated comb or crest, called by their writers *camb on hette*, or *camb on helme*. In the tenth century we find the helmet becoming conical, and approaching to the form of the nasal helmet of the eleventh.

* Poem of Beowulf. Turner's Trans. Hist. Anglo-Saxons, iii. 335-6.

BATTLE SCENE. From the Cotton MS. Claud. B 4.

The Anglo-Saxon shield appears to have been oval and convex, with an iron umbo or boss. The shields appear in the illuminations painted with red and blue borders, but the ground and centre generally white. Aneurin describes them as being made of split wood; and in the Anglo-Saxon poem of Beowulf they are called

"The shields of Hilda,
The boards of bright wood."

They were sometimes covered with leather, but, according to one of the Saxon laws, no shield-maker was allowed to put a sheep-skin over a shield.* The rim and the boss were of iron, either painted or gilt. They were held at arm's length in action, like those of the Britons, and were sometimes large enough to cover nearly the whole body; but their sizes are various in the illuminations; and we also read of "little shields," "lesser shields," and of "the targan," or "target."†

The offensive weapons were all formed of iron. Their swords were long, broad, and double-edged, their javelins and spears sometimes barbed, sometimes leaf-shaped. They fought also with axes fixed to long handles, called bills, and the double axe or bipennis, called *twy-byl*. To these some authorities add the *alle-barde* or cleave-all. The specimens of Anglo-Saxon weapons here engraved are in the collection of Sir S. Meyrick, at Goodrich Court, and were found in one of the tumuli called Chapel Tumps, near Pengethley, county of Hereford. No. 1 is the head of a javelin. Nos. 2 and 3 are spear-heads. No. 4, the blade of a bill or alle-barde. No. 5, Sir S. Meyrick considers to be a specimen of the often-talked of seax, the curved sword or dagger, from which tradition says the Saxons derived their

ANGLO-SAXON WEAPONS.

* Wilkins, Leg. Saxon. p. 59.
† Will of Ethelstan, son of Etheldred II., dated 1015.

Anglo-Saxon Weapons.

name, and with which the famous massacre of the Britons is said to have been perpetrated. That the seax was *not* a curved sword or dagger, however, is pretty evident from the testimony of Bede, who, in his relation of the attempted assassination of Edwin by an emissary of Cwichelm, king of Wessex, A.D. 625, tells us that the *twi-eced* (double-edged) *seax* of the ruffian passed through the body of Lilla, the king's thegn, who had flung himself before Edwin, and slightly wounded the king himself.* Such a blow could never surely be struck by a curved weapon. It was evidently a thrust; and if the weapon here engraved be indeed the hand-seax of the Saxons, it will be observed that it can scarcely be called curved, the hilt only taking an inclination like the but-end of a pistol. Wittichind is the only authority who speaks of a crooked sword; and if he is to be relied upon, the Saxons must certainly have abandoned it very shortly after their arrival in Britain, if not before,† as the swords discovered in Saxon tumuli are long, broad, and straight, corresponding exactly with those depicted in all the illuminations from the eighth to the eleventh century. And as to the term seax meaning a weapon of any particular shape, the proofs are all to the contrary. The word is used to express any sharp instrument, whether a sword, a dagger, a knife, or a lancet, the latter being called *æder-seax*, or vein-knife.

The spur worn by the Anglo-Saxon horsemen appears to have been the goad, or pryck-spur, and to have been fastened with leathers nearly as at present.

* Bede, lib. ii. c. 9.

† The curved or crooked sword is, in our opinion, the weapon of the third great stream of population which flowed westward—namely, the Sclavonic, and not of the second or Teutonic race, from whence the Saxons were derived. Thus we find the sabre in the hands of the Pole, the Hungarian, the Bohemian, and all the Sclavonic nations; and the still more recent Turk presents us with the cimitar.

The costume of the Danes during the ninth and tenth centuries appears, from the few authorities we possess, to have generally resembled that of the Saxons of the same period. A few national peculiarities alone distinguished them from their Anglian brethren.

Arnold of Lubeck describes the whole Danish nation as originally wearing the garments of sailors, as befitted men who lived by piracy and inhabited the sea; but in process of time, he says, they became wearers of scarlet, purple, and fine linen. On their establishment in England, we find them described as effeminately gay in their dress, combing their hair once a day, bathing once a week, and often changing their attire; by which means they pleased the eyes of the women, and frequently seduced the wives and daughters of the nobility.*

Long hair with them, as with the Saxons, was considered amongst their greatest ornaments. Harold Harfagre, *i. e.*, Fair Locks, received that appellation from the length and beauty of his hair, which is said to have flowed in thick ringlets to his girdle, and to have been like golden or silken threads. The Knyghtlinga Saga describes Canute's hair as profuse. The portrait of this monarch, which has been given in a preceding page, from the MS. register of Hyde Abbey, written during his reign, exhibits him in the customary regal Saxon costume. The only novelty observable is, the fastening the mantle by cords and tassels in lieu of a fibula or a ring. The Danes wore the same description of ornaments, but were particularly partial to their massive golden bracelets, which were always buried with them.†

The military dress of the Danes of the tenth and eleventh centuries was apparently the same as that of the Normans. Both were more heavily armed than the Anglo-Saxons. But the latter speedily adopted the superior defences of their invaders and conquerors; and at the commencement of the eleventh century, the conical helmet of iron with its nasal, or nose-guard, called *nef biorg*, and the long tunic covered with iron rings or mascles, and furnished with a hood, as an additional protection to the head and neck, are found worn in common by the three nations.

The Danish shields were generally painted red; and one of a lunated form, like the Amazonian pelta, was used by those who fought with the Danish axe—a weapon for the use of which they had acquired a terrible celebrity. The Danes were taught "to shoot well with the bow;" a weapon which the Anglo-Saxons are said to have neglected.

The task of investigating the social usages of the Anglo-Saxons cannot be completed in a very satisfactory manner. But though it may be impossible to give a distinct picture of every department of Anglo-Saxon life, a tolerably correct delineation may be made of some of its principal

* J. Wallingford, apud Gale.

† Bartholinus.—Johannes Tinmuth.

features. The labours of the husbandman varied only with the seasons, and the state of the useful arts admitted but of few subdivisions, so that there would be a great degree of uniformity in all the active and industrial operations of the community. Each large landowner divided the employment of his serfs in such a manner that they should be enabled to supply all his necessities. A large retinue, as in every rude age, was considered a mark of wealth and consequence. Labour was employed in a much less economical manner than in a period of greater civilization, and there being a small amount of free men practising the various handicrafts and most necessary employments, the number of servants and artificers required by each occupier of a large landed property could not have been otherwise than great.* From whence could the various articles of daily necessity have been obtained but from the serfs whom their lord had trained up for the purpose? It is stated in Bede that there were 250 slaves on some land which was given to Wilfrid by the king. The isolating tendency of this state of society was, however, gradually counteracted by the practice of manumitting slaves, chiefly from religious motives. Men of landed property often rewarded their serfs with grants of land when they had been particularly faithful, or had excelled in the arts to which they had been brought up. From these elements arose a free population, whose existence rendered the services of a population in a state of slavery gradually less advantageous.

The higher classes were called upon to perform a number of duties which the Anglo-Saxon institutions attached to their station. The great festivals of the church, the royal courts, which were held at Christmas, Easter, and Whitsuntide, the county courts, the hundred courts, were all occasions on which they were called upon to take an active part in public life. The clergy had a variety of duties to perform. They were the best practical agriculturists, the most skilful architects, and were, besides, acquainted with many of the common handicrafts.

The accounts which we possess of domestic usages at this period are few and brief. The hours of rising amongst a country population are invariably early. The ploughman, the shepherd, the swineherd, would be at their labours by the earliest dawn. It is not improbable that a short time was devoted during the middle of the day to a *siesta*. In the monasteries this was the case, and indeed was rendered almost necessary by the services performed "before-day," and again at the dawn of day. At mid-day the monks took a meal and slept, and again rose and went through the remaining services. In the sixteenth century, as we learn from Tusser, the labourers in husbandry enjoyed a similar relaxation.*

Persons of substance had four meals a-day; and as flesh-meat was cheap in proportion to the price of bread, there can be no doubt but that it constituted a large portion of the food of all classes. At the commencement of the eighth century, an Anglo-Saxon missionary complains that the priests rejected animal food, which he considers as some thing like ingratitude towards God. We have a strong proof of the extensive use of animal food in a law of Wihtræd, which declares that a man who gave meat to his servants on fast-days was liable to be punished in the pillory. If the servant ate it of his own accord, he was either fined or bound "to suffer in his hide."† It appears, therefore, that so much cheaper was animal food than any other, that a master was restrained from giving it to his servants, just as in many places near the sea it is still not unusual for servants to bargain with their employers not to have fish oftener than a certain number of days in each week. The food allowed on fast-days consisted of milk, cheese, and eggs. As to the inferior quality of butchers' meat in the Anglo-Saxon times, there can be no question, as it is only within the last century that it has been much improved, and the Anglo-Saxons consumed their animal food in a salted state during one half of the year. In one of the manuscripts‡ there is a drawing representing the killing of animals, and the method of preparing their flesh for the table. A sheep is killed by a stroke on the neck with an axe, while it is held by the horns. Another man severs entirely the head of an animal with the axe. These are both rude modes of butchering. The meat is cooked in a cauldron which rests upon a trivet, and underneath is the fire. One of the attendants has a crook for the purpose of taking out the meat. The use of iron rendered the process much superior to that which was once the practice of the Scottish Highlanders, who sometimes boiled their meat in wooden vessels, and effected their object by repeatedly plunging heated stones into the water.

Boiling, baking, and broiling were the usual modes of preparing animal food. The former was perhaps the most common. The Anglo-Saxons used herbs of various kinds to season their food, but their principal vegetable ingredient was colewort, which there is reason for presuming was eaten with animal food. The month of February was called "sprout-kele," from the plant beginning to grow at this season.§ There was a cook in all the monasteries, but in other households the duties were performed by females in a servile state. An opulent lady is mentioned who bequeathed her cook to one of her friends.

The ancient Saxons had been addicted to eating raw flesh; but amongst their descendants in this island, one of the canons of the church directed

* Charlemagne commanded his judges to provide for each of his castles or royal abodes "good citizens," viz., "workmen in iron, gold and silver, stone-cutters, turners, carpenters, armourers, engravers, washers; brewers skilled in making good mead, cider, and perry, and all other liquors fit to be drunk; bakers, who likewise have the art of preparing millet for our use; and all other tradesmen whom it would be too long to enumerate."—Sismondi's Fall of the Roman Empire, vol. p. 239.

that "if a person ate anything half dressed, ignorantly, he should fast three days; if knowingly, four days." The following ecclesiastical regulations have also the same tendency as the one just given:—"For eating or drinking what a cat or dog has spoiled, he (the offending person) shall sing a hundred psalms, or fast a day. For giving another any liquor in which a mouse or a weasel shall be found dead, a layman shall do penance for four days; a monk shall sing three hundred psalms."*

Some of the drawings in the MSS. exhibit the customs of the Anglo-Saxons at table. The most important fact to be noticed is, that both sexes were assembled on these social occasions, and this alone indicates many important points relative to the state of manners and civilization. Knives,

* Spelman's Concilia, p. 287.

Feast at a Round Table. Bayeux Tapestry.

horns, bowls, and dishes are placed on the tables; and loaves of bread, fish, and soup or *bouilli*, are prepared for the entertainment. The tables are

Dinner Party:—the Servants on their Knees offering the Food on Spits. Cotton MS. Tib. C 7.

each of them covered with a cloth; and in some instances the cloth appears to extend over the knees of the guests, as if it was intended also to serve as a substitute for napkins. At one table two attendants, in a kneeling attitude, offer the meat on spits. But with however keen a relish the Anglo-Saxons indulged in the pleasures of eating, they were still more addicted to the love of

drinking. William of Malmsbury, who wrote his history little more than a century after the Conquest, and was well acquainted with Anglo-Saxon manners, states that "excessive drinking was the common vice of all ranks of people, in which they spent whole nights and days without intermission." Even the festival days of the church were disgraced by intemperance; and it may be recollected that it was on the festival of St. Augustin, in 946, that Edmund I. was murdered,—a catastrophe which might have been prevented but for the inebriated state of the king's attendants and of the nobles who were present.* A few years after this, Edgar the Peaceable endeavoured to check the national vice, and to put an end to the disputes and quarrels which arose from a practice which prevailed of handing round the company a common drinking vessel, which the guests were expected to vie with each other in trying who should drain to the greatest depth. He ordered that these vessels should be made with knobs of brass at a certain distance from each other, so that no one was compelled to drink more at a draught than from one of the knobs to another. † In the poem of Beowulf, Hrothgar, one of the heroes is invited to "a feast in the hall of mead." Benches are spread in "the beer-hall;" the cup-bearer, "laden with ale," distributes it to those assembled, and the scop or poet is introduced. At another banquet described in the same poem, "there was then a number of men and women who the wine-chamber of the great mansion prepared." The description then proceeds as follows:—"Then were song and music united; the lay was oft narrated; the hall-games followed." The harp, as has been already noticed, as well as the drinking-cup, was handed round at festive meetings, and each individual was expected to sing and play on the instrument in turn. Bede relates that the religious poet Caedmon used always to rise from table before it came to his turn to perform, that he might avoid taking part in what he considered too worldly a kind of hilarity. Even at their ordinary social entertainments the evenings uniformly concluded with drinking. That there might be no mistake as to the exact point against which the prohibitions of the church on drunkenness were directed, one of the canons declared—"This is drunkenness, when the state of the mind is changed, the tongue stammers, the eyes are disturbed, the head is giddy, the belly is swelled, and pain follows." The general love of unrefined pleasures characterized the clergy as well as the laity. In Edgar's time the monasteries are described as presenting scenes of gambling, dancing, and singing, "even to the very middle of the night."* The monks were prohibited by the Council of Cloveshoe from admitting poets, musicians, or buffoons into the monasteries; and a previous Council had endeavoured to repress the love of convivial pleasures which characterized the inmates of the cloister.†

CONVIVIAL PARTY:—the Forms of the Harp, Lute, Pipe, and Trumpet, deserve attention. Harleian MS. No. 603.

The mode of salutation among the Anglo-Saxons appears to have been that which several of the continental nations still observe; for during penance a man was forbidden to kiss another.* When a stranger entered a house it was customary to bring him water to wash his hands, and warm water for his feet. Their habits of personal cleanliness deserve to be noted. The use of warm baths appears to have been general. They were held in such estimation, that the deprivation of the use of them was inflicted by the church as a penance. Sometimes the deprivation of the warm bath was joined with the prohibition of a soft bed. Cold bathing, on the other hand, was imposed as a mortification; and, at the same time, the penitent was to pay so little attention to his personal ornament or comfort, that "the iron should not come to his hair or nails." These penances, inflicted by the church, would alone prove that the warlike spirit of the ancient Saxons had greatly degenerated among their descendants, and that a long course of tranquillity and prosperity had effected important changes in their character.

The treatment of children offers an important illustration of national manners. The desertion of children sometimes occurred among the Anglo-Saxons. The practice was common among their pagan ancestors; but the influence of Christianity on one of the most natural feelings of the heart soon occasioned it to be regarded as a crime, and a law was passed which, though not well calcu-

* Leges Edgari, Wilk. p. 94.

lated for its repression, shows the kindly affections which were aroused in behalf of deserted children. For the fostering of a foundling six shillings were to be allowed for the first year; twelve shillings for the second year; thirty shillings for the third year; and afterwards the foster-parent was to receive a sum varying according to the appearance which the child exhibited of having been properly treated.* On children being bereft of their father, they remained under the mother's care; but, until the eldest child became of age, were subject to the guardianship of the husband's relations. From their birth, until after the period of childhood, children were under the care of females. Edgar rewarded with lands the wife of an ealderman who had nursed and brought him up in his childhood; and such instances of grateful feeling were not uncommon.† Cradles were used, and women generally nursed their own children.

Children were baptized by immersion, within thirty days after their birth. ‡ The holy oil, however, was also used, as in the present ceremonial of the Catholic church; and the canons of Edgar direct that priests should always keep oil ready for baptism. The connexion established between the child and those who undertook the responsibility of sponsorship was much respected. The name by which each sponsor was known to the other and to the child was "godsib," implying that they were religiously allied; the word "sib" meaning kindred.§ Names were given to children while yet infants, and they therefore indicate supposed qualities, and not those which the bearer actually possessed. Verstegan, in his admiration of our Anglo-Saxon forefathers, adverts with much satisfaction to the fact, that "nobleness, honour, honesty, valour, peace, amity, quietness, charity, truth, loyalty, and all other virtues were in their name-giving recommended."‖ Some of their names, indeed a large proportion, were, however, expressive rather of admiration of those rough qualities which are esteemed by a rude people. Thus we have Athelwulf, the noble wolf; Behrtwulf, the illustrious wolf; Hundbert, the illustrious hound; Eadwulf, the wolf of the province; Sigwulf, the wolf of victory. There are, however, others which imply more regard for the peaceful and civic virtues:—Edgar, a keeper of his oath; Egbert, advised unto equity; Earnulph, the help or defence of honour; Oswine, beloved of his house and family. Some of their female names are gentle and expressive:—Adeleve, the noble wife; Wynfreda, the peace of man; Deorwyn, dear to man; Deorswythe, very dear; Winnefride, a winner or gainer of peace.¶ Mr. Turner gives instances, showing that surnames derived from the appearance of an individual, from his dwelling-place, office, calling, or other circumstances, were in use among the Anglo-Saxons, though they were apparently by no means common.*

A father, if very poor, was allowed to give up his son to slavery for seven years, if the child's consent were given.† Even this restricting provision had not always existed, but was introduced through the intervention of the clergy in 668, though it probably would not go far towards mitigating the evil. We have seen, in a preceding chapter, that in some parts of the country the custom of peasants selling their children for slaves was common down nearly to the Norman Conquest. A child of ten years old could give evidence. Until a daughter was fifteen years old, her father could marry her to whomsoever he pleased; but after this age he no longer possessed such power. A boy of fifteen might enter upon the monastic life, if he were so disposed; and a girl at a somewhat later period. Many of the youth were received in the monasteries, where they obtained the means of instruction. The canons of Edgar directed the clergy to "teach youth with care, and to draw them to some craft." Schoolboys appear to have been kept in order, and urged to their tasks by the dread of personal chastisement, as in modern days. The youth of superior rank, after they had passed through their limited course of instruction, were initiated and rendered proficients in the manly sports of the times. It was only at a later period, however, that it became customary for the children of the higher classes to receive any school education. The brothers of Alfred the Great did not learn to read.

The respect paid to women, and the influence which they enjoyed, appear to have been greater among our Anglo-Saxon ancestors than some of the general characteristics of their state of society might have led us to expect. Before their arrival in this country the Saxons, in common with other German nations, punished unchastity in females with extreme rigour. None regard a crime of this nature with greater detestation than women themselves; and the severity of its punishment among the Saxons may be conceived when we find that to their hands was frequently committed the female who had disgraced her sex. A number of them pursued her from one place to another, and nowhere did she obtain refuge or pity, but found fresh persecutors wherever she went. Her body was pierced with their knives, till, under this cruel and vindictive treatment, she expired. In some cases the woman was compelled to hang herself; after which her body was burnt, and her partner in crime was put to death over her ashes.‡ This savage mode of protecting the honour, and promoting the virtue of women, was quite consistent with the spirit of a rude and barbarous people, who were as yet untouched by the more kindly influences of Christianity. It had, however, the effect

of giving additional support to a virtue which is the chief basis of female excellence. Other desirable qualities had thus the opportunity of taking root; and the acquisition, by women, of a considerable degree of social influence, was the natural result. Another of the causes which contributed to the elevation of women amongst the ancient tribes of the Germanic stock is probably to be found in the fortunate circumstance of their mental and bodily faculties making their progress towards maturity at something like an equal rate. When a female was fitted to become a wife, her skilfulness in household matters, and her general experience and knowledge, gave her an authority which she could not have possessed if her bodily development had been more precocious than that of her intellect and understanding. Instead of being the slaves of their pleasures, women, even in a barbarous age, exercised a permanent influence over men, and occupied the position of their associates and equals.

Very seldom, if ever, in the illuminated manuscripts which relate to this period do we find women represented as taking a part in the labours of the field, but even in those which are of the lightest kind men only are employed. In our account of rural occupations it has already been stated that the shepherd who tended his flock also milked the ewes and made cheese; and if this were the general practice, women were more exclusively occupied within doors than at the present day, when, owing to improved practices in agriculture, there are many means of employing both them and children in field work. Women were therefore placed within the sphere which is most favourable to their influence. In the East, the most liberal Musulmans, who allow a future state and future felicity to women, maintain that they will not be admitted into the same Paradise as men;* but instead of having to describe a state of society in which notions so degrading were prevalent, we find women among the Anglo-Saxons invested both in their families, in the eye of law, and by political circumstances, with their fair share of influence.† They do not appear to have attained this condition because they embellished life by their graces, for the remains of Anglo-Saxon literature do not contain any notices which can lead us to infer that the charms of female society were highly prized; but their substantial value consisted rather in the due performance of their duties as mothers and as housewives. Women were the possessors of land, of slaves, and other property. They made wills bequeathing their possessions. They appeared before the shire-gemot in disputes respecting their property; and in a case mentioned by Mr. Turner, there were present an abbot, a priest, an etheling, eight men, two abbesses, six other ladies, and many other good thegns and women. The woman obtained her suit.‡ Another case is mentioned in which a man and his wife were associated in a law-suit. In their marriages, their dignity as well as inclination was consulted; and in the History of Ely a case is mentioned of a lady refusing to marry a man because his possessions were not large enough to entitle him to sit in the witenagemot.* In the earliest of the Saxon laws that remain, those of Ethelbert, female chastity is protected by penalties, varying according to the rank or condition of the injured party. The *mund*, or protecting fine, for a widow of the highest rank was fifty shillings; for one of the second class, twenty shillings; of the third, twelve shillings; and of the fourth, six shillings. Even the violation of the domestic happiness of the serf was visited by a proportionate fine. The fine paid by the man who forcibly violated a female was increased if she were betrothed, and was still higher if she were pregnant at the time. These regulations underwent some alteration in Alfred's time, but the laws on the subject were still framed on the same principle. Concubinage was expressly forbidden, and also the marrying within certain degrees of kindred. On the father's death, the children remained under the mother's care, subject to some provisions already alluded to.

It appears clear, from all this, that women were surrounded with a number of those privileges and advantages which generally accompany a better state of society than existed in the Anglo-Saxon times. The same thing will be further apparent from a notice of some of a few particulars relative to their marriage contracts and ceremonies. The laws of Ethelbert and Edmund, the former made in the sixth or seventh, the latter in the tenth century, supply the best information on this subject. Ethelbert's law provided, that if a wife who had borne children was left a widow, she was to have one half of her husband's property; but if he died without having had children by her, the property reverted to his own kindred. The morgen-gift, which the man paid on his marriage to the wife's relations, was also to be returned. The laws of Edmund indicate more fully what was the course pursued. Nothing appears to have been taken on trust, and every step was accompanied by certain stipulations, which, however unromantic they may appear, conferred real and substantial influence on women at a period when their claims to regard would not have been so certainly acknowledged if they had rested more exclusively on moral considerations. Alfred's Boethius contains a passage in which he has embodied some affectionate feelings on the love of a wife for her husband. We give it, though it is of a higher tone than we may suppose to have generally prevailed. He says:—"Liveth not thy wife also? She is exceedingly prudent and very modest. She has excelled all other women in purity. . . . She lives now for thee; thee alone. Hence she loves nought else but thee. She has enough of every good in this present life; but

* Chardin, iv. p. 26.

† By the Canons of Edgar, women were not allowed to come near the altar at mass. It does not seem easy to account for such a regulation, unless its object was to prevent those engaged in the offices from being disturbed by their presence.

‡ Turner's History, vol. ii. p. 575. 5th Ed.

* Gale, Scrip. iii. 513.

she has despised it all for thee alone. She has shunned it all because she has not thee also. This one thing is now wanting to her. Thine absence makes her think that all which she possesses is nothing. Hence for thy love she is wasting, and full nigh dead with tears and sorrow!" The preliminaries of a marriage consisted in obtaining, first, the consent of the lady; next, of her friends, one of whom was appointed to act on her behalf, and who required not only the pledges of the bridegroom expectant, that he would keep his wife in circumstances suitable to her condition, but also the sureties of his friends, who thus bound themselves to see that he duly fulfilled his engagements. But the precautions taken did not terminate here; the next subject for consideration was the means of supporting the children who might be the issue of the marriage; and the friends of the bridegroom were here again called upon to become responsible for the proposals which he made. The amount of the morgen-gift, a bridal offering or jointure (generally a piece of land), which was given the day after the marriage; and of the property to be settled upon the wife in case of the husband's death, were next determined upon; and pledges having been mutually given that in case of removal from one jurisdiction to another no injury should arise to the wife, and, on the other hand, that if she committed any offence, the proper compensation would be made, the seal was put to all these negotiations by the performance of the marriage. This ceremony was of a religious nature, and was attended by a priest, who implored a blessing on the union. It was followed by festivities, which often continued many days. Alfred was attacked with the disorder which never left him, during the protracted banquets in honour of his nuptials. Hardecanute died with the cup in his hand at the marriage festivities of a noble Dane. The marriage of Gunihlda, Hardecanute's half-sister, who was married to the Emperor Henry III., was performed with unusual splendour. The chroniclers state that never had there been so great a display in England of gold and silver, gems, garments of rich workmanship, and horses. Songs were composed in honour of the lady, to perpetuate the recollection of her beauty, and were sung by the people for a long period afterwards. A widow might not marry until twelve months of her widowhood had expired. If she neglected this observance, she lost all claim to the property which she had obtained by her previous marriage.

In addition to the influence derived by women from the possession of property which they could freely dispose of by will, those of the highest rank not unfrequently had some share in the management of political affairs, and sometimes displayed an activity and energy which led to important events. They were, in early times, frequently instrumental in the conversion of their husbands to Christianity, and the mission of Augustin was rendered much more successful through their influence than it might otherwise have been. The influence of ladies of rank who took the veil and became abbesses could not have been unimportant throughout the whole of the Anglo-Saxon period. There are also instances in which they took a part in concerns which demanded sterner qualities. Ethelburga, the queen of Ina, put herself at the head of an army to repress an insurrection which had taken place in her husband's absence, and a fortress which she attacked was taken and levelled with the ground. About fifty years before, an able and spirited woman, Seaxburgha, the widow of King Cenwealth, had reigned for a short time, in conformity with her deceased husband's nomination, over the powerful kingdom of Wessex, in spite of the hostility of the neighbouring princes, which she counteracted by her prudence and activity. Notwithstanding this instance, however, a female sovereignty was altogether abhorrent to the notions and customs of the Saxons and the other Germanic nations. Even the right of being crowned was for some time taken from the wives of the Anglo-Saxon kings in consequence of the crimes of Eadburgha, the queen of Brihtric of Wessex, who poisoned her husband; but they afterwards recovered this honour. The queen is frequently mentioned as sitting in the witenagemot; and her position was no doubt altogether one of great influence as well as dignity. Suit seems to have been not unusually made to her, and her interest sought, when a favour was solicited from the crown. Thus, Alfwin, Abbot of Ramsay, in order to procure the favour of Edward the Confessor to his monastery, gave the king twenty marks of gold; but he did not neglect at the same time to propitiate his queen, Editha, to whom he presented five marks.

Ties of political amity were often cemented by marriages; and this would also be the means of conferring importance and distinction upon the highest rank of females, and of elevating the general standard and tone of manners with regard to women. Four of Athelstan's sisters were married to powerful princes; one of whom was Hugo, Count of Paris, the founder of the dynasty of Capet. Hugh urged his suit by an embassy loaded with splendid presents, which appear to have been intended partly for the lady, and partly for her brother, who had the disposal of her hand. Among them were the sword of Constantine the Great, the spear of Charlemagne, besides horses, perfumes, jewels, and relics. Another of Athelstan's sisters was married to Otho the Great, Emperor of Germany. Various instances might be quoted of marriages entered into by the Anglo-Saxon kings for political objects, and of the effect of such connexions in promoting peace and intercourse between different states.

But it was not only in politics that the influence of women of the higher classes was often beneficially exerted. Their mental endowments and acquisitions were also occasionally employed with the happiest effect in domestic life. It was Osburgha, the mother of Alfred, it will be remembered, who first awakened the literary taste of

her illustrious son.* Ethelfreda, Alfred's eldest daughter, was the inheritor of her father's intellect and accomplishments, as well as of his patriotic spirit, and even of his martial ardour and talent.† She is spoken of by the old chroniclers as the wisest lady in England. The character of Athelstan was formed by Ethelfleda; and her judicious superintendence of his education rendered this monarch only inferior to Alfred the Great. Editha, the queen of Edward the Confessor, we have also seen, graced her high rank by high mental cultivation. ‡

The conclusions to which we may fairly come from a consideration of the facts which have been brought forward in relation to the condition and influence of women, are, upon the whole, highly favourable both to them and to the general state of society in the Anglo-Saxon period. Women then occupied a position which has enabled them ever since to move forward with every social improvement; and their present condition is not the result of any sudden revolution in public feeling, but the consequence of a gradual advancement which has operated with nearly equal effect upon the various parts of society.

There has never yet existed a people without their peculiar sports and pastimes. The popular diversions of a nation are a part of its civilization, and they change with the various phases of its social condition. For example, hunting and fishing, which, in one stage of a people's progress, are pursued as a means of subsistence, become in a subsequent period a principal source of recreation and amusement. It is related by Asser in his life of Alfred, that the young nobles, after having received some instruction at school in the Latin tongue, applied themselves to the "arts adapted to manly strength, such as hunting." Many of the Anglo-Saxon kings were great lovers of the chase. One of them, the first Harold, received the surname of "Harefoot," from the fleetness with which he pursued the game on foot. The huntsman, however, was usually mounted. Boars and wild deer were the principal objects of pursuit, and hounds were trained for the purpose of hunting them down. Hares, and sometimes goats, were

* See p. 166. † See p. 168.
‡ See p. 187.

BOAR HUNTING. From Cotton MS. Julius, A 7.

also hunted. Nets were frequently used, into which the hunter endeavoured to drive these animals. The chase was enlivened with the sounds of the horn. The laws respecting game were mild and liberal compared with those which were afterwards enacted by the Norman princes. When the king went to hunt in any place no one was allowed to interfere with his pastime; but at other times every man might pursue the animals which were found upon his own land.* Until the reign of Canute it was customary to hunt on Sundays.

* Wilkins, Leg. Sax. 146.

HAWKING PARTY. Harleian MS. No. 603.

Hawking always ranked next in consideration to hunting, and in latter times became a sport of still higher distinction. Alfred wrote a book on the management of hawks; and, according to Asser, his biographer, he instructed his falconers, hawkers, and hound-trainers. We read of an archbishop of

Hawking. From Cotton MS. Julius, A 6.

Mons, a native of England, sending a hawk and two falcons to Ethelbert, king of Kent, at the commencement of the seventh century. The birds bred in England were not held in much esteem; and a king of the Mercians requests the same archbishop to send him two falcons that had been trained to attack cranes, not being able to procure such as were sufficiently skilful and courageous at home. Such presents, between persons of consequence, were frequently made. Hawking, at a later period, became so common that regulations were made for the purpose of restraining some of the abuses to which it gave rise. The monks were forbidden to keep hawks and falcons; and, in 821, persons carrying hawks were prohibited by a king of the Mercians from trespassing upon the lands belonging to the monks of Abingdon. Both hawks and hounds were frequently bequeathed by will. The falconer seems to have taken his birds in harvest, and after training them for use, kept them until the spring, when he let them fly to the woods; and again, in harvest, provided himself with others. By some, however, they were kept through the whole year. Birds of various kinds were also taken in snares, traps, and with bird-lime, and wild-ducks by decoys. The bow and arrow, and also the sling, were used for the destruction both of birds and beasts. In the

Killing Birds with a Sling. Cotton MS. Claud. B 4.

Cotton MS. of the paraphrase of Caedmon there is a representation of Esau going to seek venison, and of Ishmael in the desert. Both are provided with a bow and arrows, and Esau is accompanied by a dog. The bow is ornamented so as to resemble a serpent, the head being carved at one end, and the tail at the other. The string is not fixed at the extremity of the bow, but within a short distance of it. The birds which Ishmael has killed are slung by the neck on his belt.

We have no account of any horse-racing among the Anglo-Saxons; but Bede, in one passage, speaks of a party of young men trying the speed of their horses on an open piece of ground to which they happened to come.

The in-door sports were various, and suitable to different ranks. The games of chess and backgammon were both known, or at least games very similar to them. Canute is mentioned on one occasion as being found engaged in a game of tesseræ or scacci. Backgammon is said to have been invented in the tenth century, and some ety-

mologists have assigned the name a Saxon or a Welsh derivation. In the canons of Edgar games of chance are forbidden to the clergy.

The gleemen were the most important characters in the Anglo-Saxon festivals. Some of them seem to have performed tricks, gambols, and feats of all kinds, while others were harpers or bards, and ballad-singers. In the edicts of the Council of Cloveshoe, among those who practised the sportive arts, are classed poets, harpers, musicians, and buffoons. The first-mentioned class of gleemen were in fact mimics, dancers, tumblers, and performers of slight of hand tricks; and the rudiments of the drama are to be traced in some of the performances with which they amused the people. Some of their dances appear to have

DANCE. The Lyre and Double Flute are of the Classic form and proportions. Cotton MS. Cleopatra, C 8.

demanded great exertion and skill. One of these was a sort of war-dance by two men in martial dresses. They were armed with a sword and shield, and went through a mock combat to the sound of music,—the musicians, a man playing on a horn, and a female, dancing round the two combatants.

An illuminated MS. which is intended to exhibit Herodias dancing before Herod, represents her as tumbling; and it may therefore be concluded that their dancing consisted to some extent of this kind of posture-making. But exercises of strength and agility were practised by others as well as by these professional performers. St. Cuthbert is recorded by Bede to have excelled in running, wrestling, and other athletic exercises. Another of the feats of the gleemen consisted in throwing up three balls and three knives alternately into the air, and catching them in their fall. This performance is represented in one of the drawings given in the preceding chapter. Animals also were taught to dance and put themselves into various attitudes for the popular amusement. Bear-baiting, and doubtless many other unrefined amusements, afforded pleasure during an age in which education included very little to exercise the intellect.

We may here notice some of the popular superstitions of the Anglo-Saxons, the remains of their old paganism which Christianity had not succeeded in uprooting. The change from one system to the other would for a great length of time be imperfect, and, until the work was completed, we may conceive that the old superstitions would still continue to exercise an almost undiminished influence over the popular mind: some of them have scarcely yet been put to flight. The Christianized Saxons accordingly retained unimpaired that belief in witches, charms, and prognostics, which had formed the greater part of their former religion. The male or female dealer with the powers of darkness was all but universally supposed to have the power of inflicting sickness, of inciting to love or hatred, controlling the elements, or rendering the fields fertile. Every day in the year was distinguished by its aptitude or unfitness for one or other of the concerns of life. From the occurrence of some trivial circumstance at a certain time unfavourable omens were drawn; while some other equally natural and unimportant incident was regarded as the harbinger of every blessing. The diminution in the amount of individual happiness among a people liable every hour of the day to be filled with the apprehensions of approaching calamity must have been incalculable. Dreams, in like manner, operated upon the Anglo-Saxon mind with more than the force of actual events. The law, however, endeavoured to repress certain of the forms of the national superstition, which evinced in a more palpable manner the imperfect conversion of the people to Christianity. The following is one of the earlier laws which were passed with this object:—

"We teach that every priest shall extinguish all heathendom, and forbid wilweorthunga (fountain worship), and licwiglunga (incantations of the dead), and hwata (omens), and galdra (magic), and man worship, and the abominations that men exercise in various sorts of witchcraft, and in frithsplottum, and with elms and other trees, and with

stones, and with many other phantoms."* Even so late as in the time of Canute the practices here prohibited were still rife, for in one of his laws the people are ordered not to worship the sun or the moon, fire or floods, wells or stones, or any sort of tree; not to love witchcraft, or frame death-spells, either by lot or by touch; nor to effect anything by phantoms.†

We shall close our sketch of the domestic and social usages of our Anglo-Saxon ancestors with a notice of their mode of disposing of the dead and their funeral ceremonies. The burning of the dead, as practised by the Britons, after the Roman example, had at one time also been prevalent amongst the ancient Germans. The Germans were accustomed to divide their history into two periods; the first, in which the bodies of the dead were burnt, termed the age of burning; the second, termed the age of hillocks, in which the dead were buried, and a cairn or mound of earth raised over their remains.‡ But the Germans, in the time of the Anglo-Saxons, burned the bodies of criminals; and it may therefore be presumed that this was not their usual mode of disposing of their dead. There is abundance of proof that in England the custom of interment had then become general. The body of Edward the Martyr, indeed, who was murdered in 978, was burnt by his friends, and the ashes were deposited at Wareham; but this is the only instance we meet with of a body being burnt among the Anglo-Saxons. The interment of a corpse in a pit or grave succeeded to the custom of covering it only with a mound or a heap of stones. The use of coffins would not perhaps at first be general, but it subsequently became so. For persons of distinction or wealth they were of stone, and for others of wood. The corpse was sometimes covered with a sheet of lead, and was then placed in a wooden coffin. Linen shrouds were used, and the clergy were buried in the habits of their office. The burial-places at first were not in the midst of the population; but Archbishop Cuthbert, about the middle of the eighth century, obtained permission to bury the dead within cities. The churches in consequence at length became crowded with graves, so that in the course of time it was found necessary to restrain the practice; and none were allowed to be buried in the churches but ecclesiastics and persons whose lives had been distinguished by piety and good works. The body was often conveyed a considerable distance for burial. Wilfrid, Archbishop of York, died at Oundle, in Northamptonshire, in 708, and was buried at Ripon. The manner in which the funeral was conducted is thus described by the bishop's biographer, Eddius:—"Upon a certain day many abbots and clergy met those who conducted the corpse of the holy bishop in a hearse, and earnestly begged that they might be allowed to wash the sacred body, and dress it honourably, according to its dignity; and they obtained permission. Then one of the abbots, named Bacula, spreading his surplice on the ground, the brethren deposited the holy body upon it, washed it with their own hands, dressed it in the pontifical habits, and then taking it up, carried it towards the appointed place, singing psalms and hymns in the fear of God. Having advanced a little, they again deposited the corpse, pitched a tent over it, bathed the sacred body in pure water, dressed it in

robes of fine linen, placed it in the hearse, and proceeded, singing psalms, towards the monastery of Ripon. When they approached that monastery the whole family of it came out to meet them, bearing the holy relics. Of all this numerous company there was hardly one who abstained from tears; and all raising their voices, and joining in hymns and songs, they conducted the body into the church which the holy bishop had built and dedicated to St. Peter, and there deposited it in the most solemn and honourable manner." These honours, it will be recollected, were paid to a personage of importance and of great sanctity. It is mentioned* that a nobleman having died during his attendance at the King's Easter Court, the king directed that the body should be attended to the place where it was to be deposited by several bishops, earls, and other noblemen.

The custom of ringing the passing-bell when a person's death occurred originated in the Anglo-Saxon period. The intention was, that those within reach of the sound might put up a prayer for the dead. Bede relates that at the death of the Abbess of St. Hilda, one of the sisters of a distant monastery thought she heard the well-known sound of that bell which called them to prayers when any of them had departed this life; and the superior of the monastery was no sooner informed of this than she raised all the sisters, and called them into the church to pray fervently and sing a requiem for the deceased abbess.* A payment called the "soul-sceat" was made to the clergy on a person's death. The anxiety of persons to procure the prayers of the clergy for the good of their souls was one of the most productive sources of ecclesiastical wealth. One of the objects of the associations among artisans, called gilds, was to provide for the honourable interment of a member according to his last wishes. A fine, paid in honey, was inflicted upon any brother for non-attendance at the funeral; and the gild was to provide half of the provisions for the funeral entertainment, at which all who were present gave twopence for alms. If a member died, or fell sick, out of his own district, the rest were to fetch him back, according to his wish, under the same penalty. The period which elapsed between the death of a person and the interment of his remains was usually short, except where it was necessary to convey them to some distant burial-place. The body of Edward the Confessor was interred the day after his death. The head and shoulders of the corpse remained uncovered until the time of burial. It would appear from the delineations in some of their MSS., that the bodies of the dead were sometimes conveyed to the grave on a bier, and that no coffin was used. One person taking hold at the head, and another at the feet, deposited the deceased in the grave, the priest throwing incense over it. Besides the shroud, the body was enveloped in a coloured garment.

CHAPTER VII.

HISTORY OF THE CONDITION OF THE PEOPLE.

DURING the period of which we are now about to close the survey, the population of the British Islands was more diversified in respect of lineage, language, and laws, — the three great constituents of nationality, than at any other time either before or since. In Ireland, even if we suppose the Scots and other earlier Gothic colonists, or conquerors, to have been already completely melted down into the mass of the native Celtic population, we have still two perfectly distinct races dividing the land between them, and contending for its sovereignty,—namely, the old Irish, and their recent invaders, the Northmen or Danes. The latter had established themselves, by the middle of the ninth century, along the whole line of the east coast, from Belfast to Cork, and occupied Dublin and nearly all the other towns of any importance throughout the island; the proper Irish were driven beyond what might be called the pale as completely as they were some centuries afterwards by their Anglo-Norman invaders. In Scotland also a large Danish or Norwegian population was settled not only in the Shetland, Orkney, and Western Islands, but also in the northern part of the mainland: these foreigners had maintained a long and fierce struggle with the Scottish ruler for his crown; and even after their failure in that object (for the Danes never succeeded in Scotland in acquiring the supreme dominion of the country, as they did for a season both in England and in Ireland), it may be doubted if the allegiance of the Danish chieftains of Sutherland and Ross to the Celtic monarch was for a considerable period so much as nominal. The Scottish Celts themselves, though they had obtained the sovereignty of the country, and it came eventually to be called by their name, were intruders upon an older population of a different race. The Picts, the representatives of the ancient Caledonians, who had held the whole of North Britain up to the beginning of the sixth century, subsisted as an independent state till the middle of the ninth; and, although from that date united under one sceptre with the Scots, continued to be recognised as a distinct people for a long time after. A Welsh kingdom maintained its existence in the south-west of Scotland till the latter part of the tenth century. In South Britain, finally, the Welsh occupied, and retained at least the nominal sovereignty of, the whole western side of the island; and, even if we include Cumbria in the northern Strathclyde, not fewer than three separate kingdoms that were not Saxon survived there throughout the Saxon period. Nor was the rest of South Britain —that part of the island which was properly called England—all in the occupation of one race of people. The Saxons themselves were divided into at least three several great tribes; some of them were Saxons proper, some were Angles, some were Jutes; and they appear to have come from different parts of the continent—some from a point so far north as the present duchy of Sleswig in Denmark, others from a quarter so much farther to the south as the modern Friesland in Holland, and the country of the ancient Belgæ, which extended to the Seine. This mixed population continued down to the ninth century to be distributed into seven or eight distinct states or kingdoms, all, except when any of them happened to be reduced for a time to subjection by force, substantially independent of each other. But the different tribes of the Anglo-Saxons only possessed a part even of England proper. Here also, as in Ireland and in Scotland, there was settled, in full occupation and possession of a large portion of the country, a population of Danes or Northmen, who had made good their footing by their swords, and had wrested the soil from the Saxons exactly in the same manner as the Saxons had before wrested it from the Britons. These Danes at length actually acquired the sovereignty of England, and retained it for a considerable time; nor after the Saxon line of kings was restored did the kingdom itself cease to be still to a full half of its extent in the hands of the Danes.

In the latter years of the Anglo-Saxon period England appears to have been divided into thirty-two shires, of which nine constituted what was called *West-Seaxnalage* or *Sexenalaga* (the province, or, as the word perhaps properly signifies, the law of the West Saxons); eight, *Myrcenlage* or *Merchenelaga* (the district over which the Mercian law prevailed); and the remaining fifteen, *Danelage* or *Denelaga* (the Danish territory). The nine West Saxon shires were—Kent, Surrey, Sussex, Berks, Hants, Wilts, Somerset, Dorset, and Devon; the eight Mercian—Chester, Shropshire, Hereford, Stafford, Worcester, Gloucester, Warwick, and Oxford; and the fifteen Danish—Norfolk, Suffolk, Essex, Cambridge, Hertford,

Middlesex, Huntingdon, Bedford, Leicester, Northampton (including Rutland), Buckingham, Lincoln, Nottingham, Derby, and York (which in those times appears to have comprehended Durham and Lancashire, and also perhaps the whole or part of Westmoreland). Northumberland and Cumberland seem as yet to have been usually considered as rather belonging to Scotland than to England; nor was either Cornwall or Wales (in which Monmouth was included) reckoned as part of England proper.* Although, therefore, the whole country was subject to one sovereign, it may be considered as having been composed of three territories, which were probably nearly as distinct from each other as if they had been three separate states, both in regard to the races by which they were chiefly inhabited, and the laws and customs by which they were governed. The southern counties only composed the original dominion of the state which had acquired the general sovereignty; the district extending from the heart of the country to the borders of Wales was still regarded, in everything except its subjection to the authority of the common sovereign, as the distinct state of Mercia, of which kingdom it had anciently formed a part; and what might properly be called a foreign people held possession of all the east and north, a space certainly not less than that occupied by the English in the south and west. The distinction of the West Saxon, the Mercian, and the Danish laws, as severally prevalent in these three territories, appears to have subsisted for a considerable period after the Norman conquest; but in what it consisted is very imperfectly known. The account usually given is, that what is called the common law of England was originally composed of a selection from all these different codes, and received its name of the common law from that circumstance. But it may be reasonably doubted if this was really the origin of the name; the common law would rather seem never to have existed in the shape of any regularly compiled or promulgated collection of enactments, but to have been always a body of unwritten rules and usages, which were designated common, as being believed to have been observed throughout the whole course of the national history. It is probable enough, however, that the efforts of the later Anglo-Saxon kings may have been directed to the removal, as far as possible, of such diversities of legal usage as distinguished one part of the kingdom from another,—an object which the natural tendency of events would itself assist in promoting. The chief part of this task of assimilating the laws of the West Saxons, Mercians, and Danes, is generally ascribed to Edward the Confessor; but it was begun, according to some authorities, nearly a century before his time, by Edgar. Still the work does not seem to have ever been completed during the Saxon period. The West Saxons, the Mercians, and the Danes, all along appear to have had their distinct laws, though they had all, as Spelman has observed, "an uniformity in substance, differing rather in their mulcts than in their canon; that is to say, in the quantity of fines and amerciaments, than in the course and frame of justice." . . . "In those districts," says Sir Francis Palgrave, "which were conquered and colonized by the Danes, the settlement of the invaders was probably accompanied by a partial introduction of their peculiar usages. It must be recollected that these strangers made the country entirely their own. Halfdane divided Northumbria amongst his followers, who tilled and sowed the land which they had won. The portion of ancient Mercia constituting the commonwealth of the five burghs, Lancaster, Lincoln, Nottingham, Stamford, and Derby, became a Danish state in the following year; and the division of East Anglia amongst the army of Guthrun completed the colonization of Danelage. Within the limits of these acquisitions, and which, so far as East Anglia and its dependencies extended, were settled and confirmed by the treaty between Alfred and Guthrun, the conquest of the Anglo-Saxons by the Danes appears to have been as complete as that which was effected at a subsequent period by William of Normandy." "Yet," he concludes, "the influence of the more civilized community was not unfelt, and the laws which Edgar recommended to the Danes, perhaps without immediate effect, were adopted after his decease, when both Danes and Angles, in the midland and eastern parts of the island, were gradually uniting into one people. Beyond the Trent the process was more tardy; and it was not until the close of the reign of the Confessor that the laws of Canute were promulgated by the Confessor in the earldom of Northumbria. The chief peculiarities of the Danelage are to be sought rather in forms of policy and administration than in the doctrines of the law itself." *

Of the old states of the heptarchy, the West Saxon province comprehended the kingdoms of Wessex, Sussex, and Kent; the province of Mercia consisted of part of the former kingdom of the same name; and the remainder of the kingdom of Mercia, with the whole of those of Essex, East Anglia, and Northumberland, constituted the Danish province. According to the account in Bede and the Saxon Chronicle of the races by which these several kingdoms were founded, and the territories composing them originally occupied, † the subjects of the West Saxon law would be partly Saxons, and partly Jutes; those of the Mercian law, Angles; and those of the Danish law, in so far as they were not Danes, partly Angles, and partly Saxons.

The Britons, as we have seen in the preceding book, although they had strongholds in the woods, had no towns properly so called. These were first founded by the Romans. Gildas, writing in the sixth century, says, that there were then twenty-eight cities in Britain. Lists of these twenty-

* See Camden's Brit. ccxxvii., Blackstone's Com. Introd. § 3., and Palgrave's English Com. i. 48.

* English Com. p. 51. † See ante, p. 293.

eight cities under their British names are given in the History bearing the name of the Nennius of the ninth century, and in their British and in some instances also in their modern names, by Henry of Huntingdon, who, although he lived in the twelfth century, evidently compiled many parts of his work from records or documents of a much earlier period. In regard to about twenty of the names, the two lists may be considered to correspond, although both are obviously much corrupted; the remaining places seem not to be the same in the one as in the other. The lists, however, defective and in part unintelligible as they are, are still highly curious, as furnishing the oldest notice we have of the topography of Britain after the time of the Romans, and the earliest that can be regarded as appertaining to the Saxon period. The towns which are found in both lists appear to be the following:—Verulam, or the ancient St. Alban's (called Cair-Municip by Nennius, Kair-Mercipit by Huntingdon); Carlisle, Meivod in Montgomeryshire, Colchester, York, Cambridge, or rather Grantchester in the neighbourhood of that place; London, Canterbury, Worcester, Porchester, Warwick, Caer-Seiont near Carnarvon, Caerleon, Leicester, Draiton in Shropshire, Wroxeter, Lincoln; and three unknown towns, of which the British names are, in Nennius, Cair-Caratauc, Cair-Mauchguid, and Cair-Guorthigirn; in Huntingdon, Kair-Cuserat, Kair-Meguaid, and Kair-Guortigern. The last would seem to mean the City of Vortigern. The following are enumerated by Nennius, and not by Huntingdon: Cair-Guntuig, supposed to be Winwik, in Lancashire; Cair-Custeint, literally Constantine's town, probably Constanton, near Falmouth; Cair-Daun, Doncaster; Cair-Legion, Chester; Cair-Guent, either Winchester, or Caer-went in Monmouthshire; Cair-Brithon, supposed to be Dunbarton; Cair-Pensavelcoit, Pevensey; and Cair-Celemion, Camalet in Somerset. Those in Huntingdon and not in Nennius are, Kair-Glou, Gloucester; Kair-Cei, Chichester; Kair-Bristou, Bristol; Kair-Ceri, Cirencester; Kair-Dauri, Dorchester; Kair-Dorm, near Walmsford, on the Nen; Kair-Merdin, Caermarthen; and Kair-Licelid, the modern name or site of which is not known. These, however, were certainly not all the towns left in Britain by the Romans. One remarkable omission is Bath; but we are inclined to suspect that Cair-Badon, the ancient name of this city, should be substituted in the list of Nennius for Cair-Brithon, taken to mean Dunbarton, which never was a Roman town. In another list given by Alfred of Beverley, a writer contemporary with Huntingdon, although it contains only twenty names in all, we find both Caer-Badon, and Caer-Paladour, supposed to be Shaftesbury.

Although, however, some of the names, in all the lists as we now have them, may be wrong, or may be misunderstood, we may probably rely upon the correctness of the general statement of Gildas—that, in his time, the number of cities, by which he may be supposed to mean walled towns, in the island, or rather in that portion of it which had formed the Roman province, was twenty-eight. There were also, he says, some strongly fortified castles. This was, then, the amount, or at least the measure of what may be called, with somewhat more than mere etymological propriety, the *civilization* of the country at the time when the Saxons entered upon the possession of it; for, not only is it true, that without towns there can be little or no civilization in any country, but the quantity of civilization in a country may be generally taken as being nearly in proportion to the number of towns in it. These are, at least, the fountains where the light of knowledge is collected and preserved, and from which it is diffused over the population. Many of the Roman towns appear to have been deserted or laid in ruins in the course of the long, fierce, and desolating warfare that preceded the establishment of the several states of the heptarchy; no contest so obstinate and protracted had to be fought by the barbarian invaders in taking possession of any other part of the Roman empire. The Saxons, when they first issued from the seas and woods of the north of Europe for the conquest of Britain, probably held the peace and protection of walled towns and congregated buildings in contempt; and in this feeling they may have recklessly destroyed, or taken no pains to preserve, those of the British cities that fell into their hands, so long as they were actually engaged in contending, sword in hand, for the possession of the country. But as they gradually effected a settlement in it, and became transformed from invaders into colonists, and from mere soldiers into occupants and cultivators of the soil, the instinct of their new position and circumstances turned them to new views and another mode of procedure. Their attention was now awakened to what had been done by their predecessors in the sovereignty of the island; they set themselves to take advantage of, and to improve upon, the foundations which that illustrious people had laid; the Roman cities and other fortified stations were once more occupied, and became the sites and beginnings of new cities and towns, most of which subsist to the present day. But this was not nearly all that was accomplished by the Anglo-Saxons in the embellishment of the country, and in planting throughout its soil at least the roots of future industry, wealth, and civilization, during the period it was in their hands. They certainly did not work with anything like the high finish of the Romans; they were from the first, and continued all along, a people in a much less advanced state in regard to the arts, and almost every kind of intellectual cultivation, than those inheritors of all the knowledge and philosophy of the ancient world; and what they produced, therefore, was infinitely less perfect, less imposing, and in every way less remarkable in the result actually attained, than were the creations and achievements of the older and more lettered people. But they evinced, nevertheless, in all that

they did, a sufficiently robust and productive genius; and if they did not themselves carry out many things to a very elevated degree of excellence, they at least scattered the seeds of improvement for others to rear over a wide field, and in no stinted measure. Very striking evidence of this healthy fertility is afforded by the multiplication of towns and villages, which seems to have taken place in South Britain during their domination, and by a comparison of the state to which the country was eventually brought by them in this respect with the state in which they appear to have found it. It is a remarkable fact, and one which has scarcely been sufficiently adverted to, that, with very few exceptions indeed, all the towns, and even villages and hamlets, which England yet possesses, appear to have existed from the Saxon times. This is in general sufficiently attested by their mere names, and there is historical evidence of the fact in a large proportion of instances. Our towns and villages have become individually larger in most cases in the course of the last eight or ten centuries; but in all that space of time no very great addition has been made to their number. The augmentation which the population and wealth of the country have undergone, vast as it has been, in the course of so many ages, has nearly all found room to collect and arrange itself around the old centres. This fact does not disprove the magnitude of the increase that has been made to the numbers of the people, for the extension of the circumferences without any multiplication of the centres would suffice to absorb any such increase however great; but seeing how thickly covered the country actually is with towns and villages, it is certainly curious to reflect that they were very nearly as numerous over the greater part of it in the time of the Saxons. And if only about twenty-eight of our cities and towns, or even twice that number, can be traced to a Roman original, the number indebted to the Saxons for their first foundation must be very great, for, as we have seen, nearly all that are not Roman are Saxon. As for our villages, the undoubted fact that the present division of the country into parishes is, almost without alteration, as old at least as the tenth century, would alone prove that the English villages in the Saxon times were nearly as numerous as in our own day. One account, indeed, which has been often quoted as trustworthy, though it seems impossible to believe that it does not involve some great mistake, makes the number of parish churches in England about the time of the Norman Conquest to have been 45,011, and that of the villages 62,080.* The number of parishes at present is not much above 10,000, and that of the villages would probably be overrated if reckoned at half as many more. If, in like manner, instead of the numbers just given, we allow only 10,000 parishes and 15,000 villages to England in the time of the Saxons, we shall be led to form a very high idea of the extent to which the country must already have been reclaimed and settled. Let it be conceded that many of the villages were very small, consisting perhaps only of a dozen or two of cottages; still we apprehend the facts imply a diffusion of population and of cultivation vastly beyond what can be supposed to have taken place in the preceding or Roman period, during which, indeed, the country was traversed in various directions by noble roads, and ornamented with some considerable towns, but does not appear, from any notices that have come down to us, or any monuments or signs that remain, to have been generally covered with villages of any description.

Various attempts have been made to extract an estimate of the amount of the population of England in the Anglo-Saxon times from the statements in Domesday-Book; but very little dependence can be placed upon any of the inferential calculations upon this subject (for they are nothing more) that have been founded upon that record. Domesday-Book does not profess to present any census of the population; the object with which the survey was undertaken appears to have been merely to obtain an exact account of the demesnes and profits belonging to the crown, and of the public services due by the several estates in the kingdom; and whatever information respecting other matters may be found in the register must be considered as having been introduced principally if not exclusively with a view to this its primary design. It is in this way only that we can explain such entries as those which mention no more than forty-two persons as resident in the town of Dover, forty-six in St. Alban's, five in Sudbury, nine in Bedford, ten in Bristol, and many others as manifestly not intended to include the whole population of the places to which they refer. By counting a

* This statement is quoted in Spelman's Glossary, *voc. Feodum*, from Thomas Sprot, a monk of the monastery of St. Augustin, in Canterbury. The circumstance of the numbers both of parishes and of villages being set down, and that of a certain correspondence being preserved between them, would rather go to negative the supposition that there was any corruption in the text of the manuscript. On the other hand, the particularity of the figures would seem to indicate that they were the result of something like an actual computation. It appears that a similar exaggerated notion of the number of parishes in England was long entertained. In the year 1371 the parliament granted Edward III. a subsidy of 50,000*l.*, which it was calculated would be raised by an assessment at the average rate of 1*l.* 2*s.* 4*d.* upon each parish; but it was found that the number of parishes had been so much overrated that, to make up the sum, the assessment had eventually to be raised to 5*l.* 16*s.* on each. The number of parishes therefore had been taken to be about five times as great as it really was—a curious specimen of statistical ignorance on the part of a government—and also a striking example of the absurdity and inconvenience of legislating in the absence of that knowledge of facts which ought to be the basis of every legislative proceeding. So, in a treatise published in 1527 by Simon Fish of Gray's Inn, entitled 'A Supplication of the Beggars to the King,' the number of parishes in England is assumed to be 52,000. Yet several actual enumerations appear to have been made before this time. It is affirmed, in a work entitled "The Happy Future State of England," published in 1689, that a MS. in the Bodleian Library at Oxford makes the parishes in the time of Edward I. to have been only about 8900, exclusive of many chapelries since grown up into parsonages. Stowe, in his Annals, states that the parishes were actually numbered for the purposes of the tax laid on in 1371, as above mentioned, and were found to amount only to 8600. And Camden tells us (Britannia, ccxxx.) that in an enumeration made for Cardinal Wolsey in 1520, there were reckoned in all the counties of England 9407 churches. He himself gives us another enumeration made in the reign of James I., which makes the number of parish churches to amount to 9284. Although the present number of parishes, properly or popularly so called, amounts only to about 10,700 (see Macculloch's Statistical Account of the British Empire, i. 171), it has been ascertained, in the course of the recent inquiries into the administration of the Poor Laws, that the entire number of places throughout the kingdom separately relieving their own paupers is (or rather was, before the formation of the new unions) 15,635.

man for every wood, mill, pasture, or house that is mentioned (evidently a very arbitrary assumption), Mr. Turner makes the total number of persons of all descriptions enumerated in Domesday-Book to amount to 300,785. He then considers this number of individuals as representing so many families, each of which may be supposed to have consisted of five persons on an average. This would produce an entire population of about a million and a half, of which about a third part is assigned to the Danish half of the kingdom.* But as several towns, especially London and Winchester, are not mentioned at all, while the four northern counties of Cumberland, Durham, Westmoreland, and Northumberland, are likewise altogether omitted; and as, moreover, no account appears to be taken either of the monks or (except in a very few instances) of the parochial clergy, it is conjectured that at least half a million more may be allowed for these deficiencies, and that therefore the entire Anglo-Saxon population, in the reign of the Confessor, must have rather exceeded two millions.† Sir James Mackintosh has drawn up a table which appears to make the entire number of persons mentioned in the survey only 258,293. He has omitted, he says, such of Mr. Turner's estimates as seem to depend upon a supposed proportion of persons to tenements. He adds, that "nothing more than a very general approximation can be expected till Domesday-Book be much more critically examined than it has hitherto been." Perhaps it would have been more correct to say that no satisfactory information upon the subject in question is likely ever to be obtained from that source.

Some valuable particulars, nevertheless, of another kind may be thence gathered in illustration of the state of the country in the Anglo-Saxon period. In the first place, we obtain evidence at least of the existence in those times of a long list of cities and burghs (as they are usually designated in the record), comprising nearly all the considerable towns the kingdom yet contains; a good many of the number, indeed, having apparently been of greater consequence then than they are now. We also gain some small insight into the government or political constitution of these burghs; and some light is thrown upon the constitution of society generally by the notices of the different classes or orders of the people, though, for the reasons that have been stated, little or nothing can be inferred from the particular numbers of each class that are registered in different places.

The larger towns, as we have just observed, were distinguished among the Saxons by the name of *burghs*, the same term with our modern English boroughs.* The word burgh has been derived from the Latin *burgus*, which was in common use in later times among the Romans for a fort or military stronghold, and is itself nearly the same with a Greek word of similar signification which is as old as the time of Homer.† The burghs of the Anglo-Saxons appear to have in most instances arisen out of the military stations of their Roman predecessors; as the places they distinguished by the name of cities had in general, if not always, been Roman towns or *civitates*. All cities, however, came in course of time to be considered as burghs, though only some burghs were cities.

"It must be clearly understood," observes Sir F. Palgrave, "that a Saxon burgh was nothing more than a hundred, or an assemblage of hundreds, surrounded by a moat, a stoccade, or a wall; and the name of the hundred was actually given to some of the most considerable cities, burghs, and towns of England. No right was conferred or destroyed by the feeble fortification which protected the burgesses; and the jurisdiction of the burgh-moot or portmoot differed from that possessed by the analogous districts in the open country only in consequence of the police required by a more condensed population, and the institutions, perhaps of Roman origin, which incorporated the trading portions of the community."‡ "We must abandon," the learned writer afterwards remarks, "any conjectures as to the government of the burghs in the earlier periods. We must rest satisfied with the fact that, in the reign of the Confessor, the larger burghs had assumed the form of communities, which, without much impropriety, may be described as territorial corporations. The legal character of the burgess arose from his possessions; it was a *real right* arising from the qualification which he held. The burgess was the owner of a tenement within the walls, and the possession might descend to his heirs, or be freely alienated to a stranger. The lawmen of the burgh were so denominated in respect of the mansi which each held. . . . . Lawmen occur by name only in the Danish burghs; but a similar territorial magistracy existed in other places. The soke of the aldermen of Canterbury was transferable, like any other inheritance; and the possession of the land imparted to the lord the right of judicature in the burgh-mote or municipal assembly. Such functionaries were lawmen or aldermen by *tenure*. Other burghs, however, may possibly have possessed an elective magistracy. . . . Nor is it improbable but that the guilds of traders and handicraftsmen possessed considerable influence; and the aldermen of these cor-

* But upon what authority does Mr. Turner exclude from the Danish part of the kingdom the counties of Northampton (with Rutland), Leicester, Nottingham, Buckingham, Cambridge, Hertford, Bedford, Derby, Huntingdon, and Middlesex, which the old writers generally enumerate as belonging to the Danelage? Restoring these counties to their proper place in the table, the account will stand thus:—Danish counties, 151,100; other counties, 149,685. Cornwall (with 5606 persons for its share) is included among the latter.

† Turner's Hist. Ang.-Sax. iii. 254.

* In Scotland the term used is still *burgh*, which however is there always pronounced *as a word of two syllables*, and exactly like the English *borough*. Thus the name of the capital is a word not of three, but of four syllables,—as Wordsworth has correctly *given* it,—

"And stately Edinburgh throned on crags."

But the true old Scottish form of the word, also still in familiar use, is *brogh*, with the guttural strongly pronounced.

† See Jos. Scaliger, Lection. Auson. ii. 9.—Palgrave's English Commonwealth, p. 353.—The Burgundiones, or people of Burgundy, are said to have been so called as being sprung from the soldiers by whom the Roman forts in that country were occupied. porations may have been allowed to enter the folk-moot, and to share in its proceedings." *

Sir Francis proceeds to state that, in the larger and more important cities, the only rights that the king had were to the various payments and services which were imposed upon the municipal communities, and that, provided these were discharged, he had nothing more to demand,—he could not exact the oath of fealty from the citizens, nor even enter within their walls without their consent. The only fact, however, which is referred to in proof of these positions is the resistance made to the Conqueror by the citizens of Exeter, who, as will appear in the next Book, although they offered to pay to that king the same tribute they had paid to his predecessors, refused to become his men or vassals. But an act of resistance like this to the attack of a foreign invader (for such William might very naturally be considered in a part of the country which he had not yet overrun) would seem to afford no evidence from which we could safely infer what were the privileges possessed or claimed by the burghs under a government which they completely acknowledged. It is difficult also to understand how the Saxon burghs should have acquired this independence of the royal authority, considering the gradual manner in which they appear to have grown up to whatever importance they actually did attain. It is admitted, as we have just seen, that in their origin they were merely certain of the inhabited localities, which either from having been formerly occupied by the Romans, or from the peculiar natural advantages which they presented, came to be surrounded with walls, ditches, or some other such protection; but this visible line of demarcation conferred no peculiar character upon the community which it inclosed. It tended no doubt to produce a state of things favourable to the acquisition, by the burgesses, of the right of managing both the police and the internal government generally of their burgh; but in the absence of any record of so remarkable a revolution, we cannot venture to assume that these walled towns eventually became so many all but independent republics established all over the kingdom, as they would really have been if we can suppose them to have held, in relation to the general government, the position which the men of Exeter took up against William the Conqueror.

The word town, it is to be observed, conveyed a different idea, as used by our Saxon ancestors, from what it now does. A town or township (in Saxon *tun*, from *tynan*, to inclose) was very nearly the same with what came after the Conquest to be denominated a manor. Sir Francis Palgrave explains the term thus:—"Denoting, in its primary sense, the inclosure which surrounded the mere homestead or dwelling of the lord, it seems to have been gradually extended to the whole of the land which constituted the domain."† "Every Anglo-Saxon township," he afterwards observes, "was subjected, in demesne, to a superior; to the sovereign, whether king or eoldorman, who succeeded to the very extensive possessions of the British princes; or to a lord (a hlaford, or landrica). In some few instances the township belonged to small corporations, if such a term may be used, whose members held the township as a joint property. . . . . The right of the lord of the township was accompanied by the sovereignty of the land. I apply the term sovereignty, rather than that of ownership, because the superiority of the township was unquestionably vested in him, although his right of possession does not seem to have extended beyond the demesne or inlands, which he enjoyed in severalty, and which he cultivated as his own. Another portion of the township consisted of the feuds which he or his predecessors had granted by landboc (or charter) to the sokemen. Such a benefice, præstarium, or feud, which in Anglo-Saxon was denominated a Laen, was usually created for one, two, or three lives, to be nominated by the grantee, after which it reverted to the lord; and during the existence of those derivative estates, the lord, according to the language of the later law, had only the services and the reversion. Some benefices, however, were granted in perpetuity. Analogous in many respects to the benefices were the lands which were held by the tenants, whether Sokemen or Bondes, by folkright, or customary tenure; but these do not appear to have been generally subject to devise or alienation. Lastly, every township contained those extensive common fields, or common leasowes, which the law assumed to belong to every town, and of which the usufruct was shared between the lord and the men of the community.*

The whole country, therefore, it will be observed, was divided into towns, or townships, as well as into hundreds and shires. And the township, as well as the hundreds and shires, constituted in every case, for certain purposes, a community by itself, having a jurisdiction and legislative powers of its own. The chief government belonged to the lord; but it appears that the court in which it was exercised could not be held without the presence of a certain member of the Sokemen or tenants.† The deputy of the lord, and the functionary through whom he usually exercised his rights, was the Tun-Gerefa, or Town-Reeve. "No township," says Sir Francis Palgrave, "was without a gerefa, who was allowed, in the folk-moots, or judicial assemblies, to speak and act on behalf of the Twelfhindman, who was the lord of the township, and to give such testimony as would have been given by the lord himself: and the right of being so represented was one of the peculiar privileges of the aristocracy. He appears to have been the fiscal officer of the lord: he received the seignorial tolls and dues, and superintended the performance of the agricultural labours of the villainage."‡ Yet the gerefa, though thus the officer of the lord, seems to have been usually

elected to his office by the tenantry. By him, and by four good and lawful men by whom he was attended, the township was represented in the monthly courts of the hundred and the half-yearly courts of the shire. Each township had also the keeping of its own police: when a crime was committed, the inhabitants were required to raise the hue-and-cry, and were bound to enforce the appearance of the offender to take his trial.

These statements, taken in connexion with the notices in a former chapter, of the tithings and the system of frank-pledge,* will enable the reader to understand the general arrangement of the Anglo-Saxon population, in so far as regards its territorial or local distribution. An account has also been already given of the leading distinctions of rank and political condition by which it was marked. What was properly called the people, was divided into two great classes—the noble, and the ignoble; the eorls, and the ceorls; or, as they were designated by a form of expression that denoted the relative estimation in which they were severally held by the law, the Twelfhaendmen and the Twihaendmen—that is, people with a dozen hands each, and people with only a pair each. In this general division, however, we must consider as included in the first class, not only the Eorls, or Eorlcundmen, or Thaneborn, who were, strictly speaking, the men of twelve hands, but also the Ealdormen, or persons of the royal blood, upon whom a still higher value was set, and the inferior nobility or gentry, designated Sithcundmen, or Sixhaendmen.† On the other hand, the Twihaendmen were also of various descriptions, or at least were known by various names, although among them no distinction existed in respect of legal estimation. The general name by which they were known was that of Ceorls, the origin of our modern churls.‡ In Latin they were called Villani, translated Villains, which properly signifies nothing more than the inhabitants of the villa, that is, of the township, whether it was a village or merely a farm. The word villagers would convey the nearest idea of what was meant by villani to a modern ear. Another name of the Ceorls was Bonds, or Bondsmen, that is, occupants of the soil. Boors, a name by which they were also called, means the same thing. Other descriptions of Ceorls were the Cotsetan, in Latin, Cotarii, that is, cottiers, or holders of small tenements; and Bordarii, a term of which the exact meaning is not known.§

Not accounted as at all forming part of the people, but deprived of all rights, both political and personal, and classed rather with the cattle than among human beings, were the Theowes, in Latin, servi, which may be translated serfs, or slaves, in modern language. The theowes, as has been already observed, were probably, for the most part, persons who had either been convicted of crimes, or captured in war, or their descendants. Some of them may also have been the descendants of the old British cultivators of the soil; but it is not likely that these were generally reduced to a state of slavery by their conquerors. The Saxon theowes spoke the same language, and, according to every appearance, were in general of the same race with their masters.

Although we have not any account that can be depended upon as giving the exact numbers of the different classes of the Anglo-Saxon population, there can be no doubt that by far the most numerous class was that of the Ceorls. They formed the great body of the nation, corresponding very nearly in their social, though not in their political position, to the vast mass that came in after-times to be known by the name of the Commons of England. They are by no means fully represented merely by the class now called the common people. If we may be permitted for the moment to regard the theowes as answering to our modern convicts, the Ceorls may be considered as comprehending all the rest of the population except the nobility and the clergy. To this class belonged not only those of the labourers, the peasantry, and the artisans, that were not theowes, but also the traders of all descriptions, the farmers, and all the smaller landholders and owners of tenements, whether in burgh or in the open country. Every lay person, in fact, who was not an eorl was a ceorl.

As for the clergy, of all orders, they were substantially ranked with the nobility, if we ought not rather to say that they were considered as occupying a still higher place in the state. While the compurgatory oath of one eorl, for instance, was equal to that of only six ceorls, a priest in this matter was considered as equivalent to one hundred and twenty ceorls; a deacon to sixty; and a monk who was neither priest nor deacon, to thirty. The word of a bishop, again, like that of the king, was conclusive in itself, and did not require to be supported by the oaths of compurgators. The lowest priest was considered as a mass-thane, that is, a nobleman or knight of religion, and had the same degree and honour as the world-thane, with whom he was ranked in the scale of the community.*

Tacitus bears testimony to the lenity with which the ancient Germans treated their slaves, although he states, at the same time, that when a master chanced to kill his slave, as sometimes happened in the heat of passion, he committed the act with impunity. We have no reason to suppose that the Anglo-Saxons differed in this matter from the custom of their ancestors. Their slave population was not so numerous as to keep them in any state of apprehension from that quarter, or to make great severity or strictness of discipline necessary in the way of self-protection. The number of the

‡ Scott, in his Introduction to the 'Lay of the Last Minstrel,' has preserved the familiar old rhyming distinction of our Saxon ancestors:—

"It was not framed for village churls,
But for high dames and mighty earls.

§ Palgrave's English Com. p. 17. See also "A General Introduction to Domesday-Book, by Sir Henry Ellis, K.H." 2 vols. 8vo. 1833, pp. 44—94; and Sergeant Heywood "On the Ranks of the People under the Anglo-Saxon Government." 8vo. Lon. 1818.

servi reckoned up in Domesday Book is only between twenty and thirty thousand; and it may be fairly assumed that they and their families did not amount to a tenth part of the entire population. We find no trace of any servile insurrection in Anglo-Saxon history. The life of a theowe, indeed, was no further protected by law than that of one of the inferior animals; but he was in general worth much more to his master than a cow or an ox, and nearly as much as a horse; and therefore we may suppose the slaves would be on the whole at least as well taken care of as the cattle. It appears, moreover, that this unfortunate class was not deprived of all means and opportunities of acquiring property. Fines were imposed upon them, as upon others, for offences, by the laws; and frequent mention is made of slaves themselves purchasing their freedom. The practice, also, of masters emancipating their slaves, sometimes by their wills, sometimes in their lifetime, became more and more common as the influence of the church extended itself, and religious feelings spread throughout the community.

It does not appear that any particular kinds of labour were exclusively assigned to the theowes. They seem to have been employed in the different handicraft arts as well as in the operations of agriculture, indifferently with the bondes. The latter, however, from their greatly superior numbers, must have constituted the chief strength of the national industry. While Domesday Book mentions only about 26,500 servi, it enumerates about 184,000 villani, bondarii, and cottarii. These must have been all, or nearly all, labourers, partly for themselves, perhaps, in the cultivation of their small holdings, but principally for the proprietors on whose estates they resided. Every peasant was obliged by the law, if he had not a domicile of his own, to find a householder who would take him into his service, and allow him to become one of his household. The villains who were householders were called heorth-fastmen; the others, folghers, that is, followers. Any householder who allowed a person to pass three nights under his roof became responsible for the conduct of that person, and seems to have been obliged to retain him, at least for a certain term, as an inmate.*

Besides all these villani, and other inferior classes of the peasantry, Domesday Book notices about 26,000 tenentes, subtenentes, and sockmanni, about the half of whom are distinguished as liberi homines, or freemen. These latter, at least, though counted as still belonging to the class of ceorls, must be supposed to have been exempted from that personal control and adscription to the soil under which the villani laboured. Above 17,000 burgesses and citizens are also enumerated; but this number, as has been already observed, cannot be taken as that of the entire population of the cities and boroughs throughout the kingdom, nor even as that of the householders. It may be that of the tenants of the crown, or those upon whom the crown had some claim of services on account of their tenements. The cities and burghs, as well as the country, no doubt contained both theowes and persons of each of the various descriptions of ceorls; and it is probable that most of those who practised the handicraft arts, as well as those engaged in trade, resided in these natural receptacles and sheltering places of collective industry.

The associations for various purposes, which went by the name of gilds or gildships, have been already alluded to; they seem to have been common among all classes, and to have been, some of them, of the nature of our modern friendly or benefit societies, while some were mere convivial clubs. Others, however, were associations of the traders or artisans of particular kinds in the cities and burghs; and these appear to have been permanent institutions, which perhaps took their rise from the colleges of operatives in the Roman towns, and may be regarded as perpetuated in the guilds, or incorporated trades, of modern times. As the burghs gradually acquired more and more of the right of self-government, these fraternities or companies may be supposed to have obtained a share in the appointment of the municipal officers and the general direction of affairs.

The feature in the Anglo-Saxon system of society that appears the most singular to our modern notions is, the existence of a large body of the people in the condition which has been described as that of the villani, or chief cultivators of the soil,—that is to say, not subject to the control of any master who had a right to regard and use them as his absolute property, but yet so completely destitute of what we understand by freedom, that they had not the power of removing from the estate on which they were born, and were transferred with it on every change of proprietors, they and their services together, exactly in the same manner as any other portion of the stock, alive or dead, human or bestial, which happened to be accumulated on its surface. They were bound to the soil, and could no more uproot themselves and withdraw elsewhere, than could the trees that were planted in it. This system seems to have been of great antiquity among the Teutonic nations. The kind of prædial slavery which Tacitus describes as existing among the Germans of his time, is plainly nothing more than this villainage of the Anglo-Saxons. "The rest of their slaves," he says, after having noticed those that were freely sold like any other goods, "have not, like ours, particular employments in the family allotted them. Each is the master of a habitation and household of his own. The lord requires from him a certain quantity of grain, cattle, or cloth, as from a tenant; and so far only the subjection of the slave extends."* It was natural enough for Tacitus to speak of this as a state of slavery; but it is probable that neither these German villani nor their lords considered the matter in that light. Tacitus, whose acquaintance with the subject was evidently superficial enough,

* Palgrave's English Commonwealth, p. 20.

* Germania, c. 25. Aikin's Transl.

does not carry his delineation beyond these few general strokes, giving the mere outside view of the case; but to understand it fully it is necessary to look to it from other points. These Anglo-Saxon villani could not, indeed, withdraw themselves from the soil to which they were said to be adscribed, nor could they withhold their services from whosoever might become by inheritance, by gift, by purchase, or in any other legal way, the lord of the manor. This is, in plain language, the whole amount of the obligation under which they lay. They were under the same obligation under which every modern tenant or lessee lies during the currency of his lease, with this difference only, that the latter, provided he continue to pay his rent, may withdraw his person to where he pleases. But his rent he is as strictly bound to continue to pay as the villain of old was to pay his yearly dues, and to render the accustomed services. That these services were often of a menial or otherwise degrading description, or, more correctly, of what would now be considered so, does not affect the principle of the case; they were suited to the circumstances of the time, and no doubt the persons bound to perform them would not, in general, have agreed to any proposal of commuting them for money-rents. This, then, we repeat, was the obligation lying on the villain; he was bound to pay certain dues, and to render certain services to his lord, which there is no reason to suppose were usually felt to be any heavier burden than the payment of rent is felt to be by a tenant of the present day. But had he no rights as well as obligations? The soil, in truth, was as much his as he was the soil's. If he could not leave it, so neither could he be driven from it. It was his property to occupy, and cultivate, and reap the produce of, as much as his services and dues were the property of his lord. The master could no more sell, or dispossess, or in any other way (except by divesting himself of the land) get rid of his villain than the villain could get rid of his master. There can be no doubt that even those of this class of persons who possessed the smallest tenements considered themselves better off, with all the services they had to render, than if they had been without both the services and the tenements. With our modern feelings, we think only of the villain as being born to a lifetime of hopeless bondage—he, and his children, and all his descendants after him;—he, we may be sure, looked upon himself and them as born to the inheritance of a property of which no one could deprive them. Of what real advantage would it have been to the villain in that state of society to possess the liberty of transferring his person and his residence from one property or one part of the kingdom to another? If the law had allowed him such a liberty, the circumstances of the times would have made it, in general, almost impossible for him to exercise it. To whom could he have gone, or who would have received him, if he had left his natural lord? We have no reason to suppose that the services of the villains were, in general, accounted more than an equivalent for their holdings, or that, consequently, one lord would have usually been inclined to outbid another in a competition to obtain them. The case was most probably quite otherwise. These men were originally the military followers of their lord, who settled them upon his lands because they had a claim upon him for their services, and because, from the relation in which they stood to him, he was held to be bound to provide for them. The arrangement was, indeed, to a certain extent, a beneficial and necessary one for him as well as for them—since, if they required the land to live upon, the land required them to cultivate it; but the circumstances of the case certainly would not have admitted of their interests being entirely sacrificed to those of their lord; and we may fairly presume that both parties shared, however unequally, in the advantages of the transaction. The former inhabitants would, no doubt, have been glad to remain to cultivate the ground; but although we may not suppose them, with some, to have been in every case altogether swept away to make room for their conquerors, it cannot be questioned that they were obliged to give place to the new comers to a very great extent. Had they not, the conquest of the country would have afforded no means of rewarding those by whom it was achieved.

Nothing has varied more than the notions that have been entertained in different ages and countries respecting what it is that constitutes the freedom of a nation, or of a class of men. It is evident that freedom and slavery are not two conditions essentially and at all points opposed to each other, as they are commonly represented by the rhetoricians, but that the one rather melts by almost imperceptible gradations into the other, and that there is a considerable border space which may be indifferently, or, according to the point of view from which it is regarded, considered as either slavery or freedom. It is like the distinction between high and low, or between great and small, or any other qualities of a similar kind, which, although opposed in a sufficiently marked manner in their higher degrees, yet lie, in fact, as it were, in the same continuous line, of which, notwithstanding the wide separation of the extremities, the middle portion must always be of debateable character, and assignable to either. Rigidly speaking, a nation or a class of persons is not entitled to call itself free, so long as it lies under any restraint whatever from which it might be relieved, or is deprived of any right which it might be allowed to exercise, without prejudice to the common safety and welfare. But even this point does not admit of being determined by any infallible and universal formula, in so many respects have the actual circumstances of one age and country differed from those of another, and such disagreement will there always be in the judgments and opinions of men as to these questions. Nor below the point thus fixed upon, although it may be denied that there is anything that can properly be called freedom, will it be

affirmed that there is nothing but slavery. In fact, whatever freedom, or so called freedom, has been hitherto enjoyed by men in political society, has probably been for the most part something inferior to what the above definition would consider to be freedom at all. Still it may be quite as properly spoken of under the name of freedom as under that of slavery; for in truth it is a mixture of the two. It will be naturally in each case regarded as slavery or freedom, according as the one or the other of these conditions is conceived to preponderate; and if there appear to be any considerable quantity of freedom at all present, it will be described as a state of freedom more or less complete. But yet different ages and countries, not to speak of different individuals, will not always demand the presence of the same elements to constitute freedom of any kind. Sometimes this prized possession will be conceived to consist in political privilege,—sometimes in exemption from personal restraint,—sometimes in mere security of person and property.

It was this last-mentioned and lowest kind of freedom which was enjoyed by the villains of the Anglo-Saxon period. They were subjected to many restrictions and burdens which we should now account of the most oppressive character; but still they were not held to be in a state of slavery, because, with all their privations, the law yet threw its full protection around both their persons and their property. It treated them as persons and not as things. They were no man's property to do as he chose with. They were, it is true, inseparable from the soil of the estate on which they lived, and as a matter of necessity, therefore, when the estate received a new owner they received a new lord; a modern tenant in the same manner receives a new landlord whenever the farm which he rents is transferred from one proprietor to another, as it may be at any time, without any more right on his part to object or interfere than had the Saxon villain. But the villain could not himself be sold, as the theowe might be; nor could any of the rights appertaining to his condition, such as they were, be disregarded with impunity, any more than those of the classes of persons that were higher in the social scale. He may have had no political rights, and even his social rights may have been extremely limited; but the slave, properly so called, had no rights of any kind. He was, at least in the original purity of the system, a mere item of his master's stock,—a portion of his goods and chattels.

Sir Francis Palgrave has advanced the opinion, that "perhaps the essential distinction between the classes of the nobility and the plebeians, was the entire absence of political power in the ceorl."* Little doubt, we imagine, can be entertained that those of the ceorls who were in a state of villainage were wholly destitute of political power; and this class seems to have constituted by far the largest portion of the population; but the assertion of the learned writer may perhaps be thought not to be so indisputably applicable to those of the tenentes, subtenentes, and sockmanni of Domesday Book, who are there marked as freemen (liberi homines). These were ceorls who certainly at least were not villains; and it seems to be not unlikely that along with their freedom from adscription to the soil they had acquired some other franchises.

The period over which we have now passed, though exhibiting many features of a state of society only yet emerging from barbarism, is a most important one, as having been that in which were first brought together the germs of modern European civilization. A foreign writer of our own day, to whose learned and philosophical speculations we have already had more than once occasion to refer, has given a view of it in this light, which is in several respects novel and well deserving of attention.* Though a chaos, he observes, it was a chaos out of which was to spring all of order, and light, and life, which our present civilization has to boast of. The three elements of that civilization may be regarded as being the Roman world, the Christian world, and the Germanic world.

I. The working of the two latter of these elements, having been more on the surface, has been less overlooked than that of the first. Nevertheless, the first has been no less active, no less influential, than the other. M. de Savigny, in his history of the Roman law after the fall of the empire, has proved that the Roman law never perished, but that, though with great modifications undoubtedly, it was perpetuated from the fifth to the fifteenth century. M. Guizot has gone further. He has, to use his own words, "generalized this result." He has shown that not only in municipal institutions and civil laws, but in politics, in philosophy, in literature,—in a word, in all departments of social and intellectual life, the Roman civilization has been perpetuated beyond the empire; that there is no break in the continuity; in a word, that the modern is throughout still, to a considerable degree, the prolongation of the ancient civilization.

We have already touched upon the subjects of the imperial power and the municipal institutions,—in other words, of what modern civilization derived from ancient in a social point of view; it remains to say a few words of what it received in an intellectual point of view from Greco-Roman antiquity.

M. Guizot considers it as a fact, though far too little attended to, of immense importance, that the principle of liberty of thought, the principle of all philosophy, reason taking itself as a point to start from and as a guide, is an idea essentially the offspring of antiquity, an idea which modern society derives from Greece and Rome. It came neither from Christianity nor from Germany, for it was contained in neither of these elements of our civilization. Another intellectual legacy left by the Roman civilization to ours is that of the classical

* English Com. p. 19.

* Guizot Hist. de la Civilis. en France.

works of antiquity. Spite of the general ignorance that pervaded the middle ages, spite of the confusion and barbarism attendant upon the corruption of the Latin language, the ancient literature has always been held up to the mind as a worthy object of admiration, of study, of imitation; in a word, as the type of the beautiful. The philosophical spirit and the classical spirit, the principle of freedom of thought and the model of the beautiful, these were what the Roman world handed down to the modern world, what survived it in the intellectual order of things at the end of the tenth century.

II. The effects of Christianity under the intellectual point of view are so important, as they have been developed by M. Guizot, that they deserve especial consideration.

Most of the philosophers, whether of the most brilliant era of Greek antiquity, or of later times, under the Roman empire, pursued their speculations nearly in perfect freedom. The state scarcely interfered either to check or control them. They, on their part, meddled little with politics; sought little to exercise a direct and immediate influence on the society in the midst of which they lived; satisfied with that indirect, remote influence which belongs to every great mind placed in the midst of mankind. With the triumph of Christianity in the Roman world the intellectual development changed its character: what was philosophy became religion—the form of thought became religion. From that time it aimed at much more power over human affairs. The spiritual order continued, indeed, to be separate from the temporal order. The government of nations was not directly and fully handed over to the clergy. But the spiritual penetrated much further into the temporal order of things than was the case in the Greek and Roman antiquity.

From this, resulted another change, not less important. As human thought, under the religious form, aspired to more power over the conduct of men and the destiny of nations, it lost its liberty. But when, after a long time, the religious form ceased to have an exclusive dominion in human thought, the philosophical development recommenced. What was the consequence? Philosophy made the same pretensions to practical interference that religion had done; or, more accurately speaking, thought, having again become philosophical, retained the pretensions which it had assumed under the religious form. Philosophy aspired to do what religion did—with this difference, however—that while it wished to govern mankind, it refused to submit to a legal yoke. "The union," says M. Guizot, "of intellectual liberty, as it existed in antiquity, and of intellectual power, as it displayed itself in Christian communities, is the grand, the original character of modern civilization; and it is undoubtedly in the bosom of the revolution accomplished by Christianity in the relations of the spiritual and temporal orders, of thought and the exterior world, that this new revolution had its origin and its first vantage ground."*

III. The two principles, or rather the two germs of principles furnished by Germany, were the tribe formed of all the heads of families who were proprietors, and governed by an assembly of free men; and the band of warriors, where the individual was still very free, but where the social principle was no longer the equality of free men, and common deliberation, but the patronage of a chief over his companions; and if we consider the system of social organization, it was fitted to produce aristocratic and military subordination.

The principle of the common deliberation of freemen may be said to have disappeared in the Roman world. The principle of aristocratic patronage, combined with a strong infusion of liberty, had become equally unknown. Both these elements of our social and political organization are of Germanic, or, to speak specifically of England, of Saxon origin.

The two grand results that specially demand consideration are these: 1. The unbroken continuity, though undoubtedly much weakened and modified, of ancient civilization down into modern. 2. The total want, both in the social and intellectual order of things, from the fifth to the tenth century, of any stability, of anything systematic, of anything fixed, general, regular. The general fact we meet with is a continual, universal fluctuation. It is, in truth, the work going on of the fermentation and amalgamation of the three great elements of modern civilization.

Great Seal of William the Conqueror.

CHAPTER I.

NARRATIVE OF CIVIL AND MILITARY TRANSACTIONS.

WILLIAM I., SURNAMED THE CONQUEROR.

THE first feelings of the Normans after the battle of Hastings seem to have been sensations of triumph and joy, amounting almost to a delirium. They are represented by a contemporary* as making their horses to prance and bound over the thickly-strewed bodies of the Anglo-Saxons; after which they proceeded to rifle them and despoil them of their clothes. By William's orders the space was cleared round the Pope's standard, which he had set up; and there his tent was pitched, and he feasted with his followers amongst the dead. The critical circumstances in which he had so recently been placed, and the difficulties which still lay before him, disposed the mind of the Conqueror to serious thoughts. Not less, perhaps, in gratitude for the past than in the hope that such a work would procure him heavenly favour for the future, he solemnly vowed that he would erect a splendid abbey on the scene of this, his first victory; and when, in process of time, this vow was accomplished, the high altar of the abbey church stood on the very spot where the standard of Harold had been planted and thrown down. The exterior walls embraced the whole of the hill,—the centre of their position which the bravest of the English had covered with their bodies,—and all the surrounding country where the scenes of the combat had passed, became the property of the holy house, which was called in the Norman or French language, *l'Abbaye de la Bataille*, and was dedicated to St. Martin, the patron of the soldiers of Gaul. Monks, invited from the great convent of Marmontier, near Tours, took up their residence in the new edifice. They were well endowed with the property of the English who had died in the battle, and prayed alike for the repose of the souls of those victims and for the prosperity and long life of the Normans who had killed them.*

Thierry.

* William of Poictiers. This writer asserts, that although Harold's mother offered its weight in gold for the dead body of her son, the stern victor was deaf to her request, professing indignation at the proposal that he should enjoy the rites of sepulture for whose excessive cupidity so many men lay unburied. Harold, it is added, was buried on the beach. Most of the English historians, however, say that the body was given to his mother without ransom, and interred by her in Waltham Abbey, which had been founded by Harold before he was king. The Cottonian MS., Julius D. 6, which appears to have been written in Waltham Abbey about a century after the event, relates that two monks, who were allowed by William to search for the body, were unable to distinguish it among the heaps of slain, until they sent for Harold's mistress Editha, "the swan-necked," whose eye of affection was not to be eluded or deceived. The improbable story told by Giraldus Cambrensis (and in more detail in the Harleian MS. 3776) about Harold, after receiving his wound, having escaped from the battle, and living for some years as an anchorite in a cell near St. John's Church, in Chester, though a pretty enough romance, is palpably undeserving of notice in an historical point of view.

BATTLE ABBEY as it appeared about 150 years since.—(In the case of an old building, of which only the ruins now remain, the cut will generally represent the building in the most perfect state in which an authentic engraving or drawing of it can be obtained.)

The Abbot of Battle was declared to be independent of the authority of the Archbishop of Canterbury and all other prelates, and was invested with archiepiscopal jurisdiction, and honoured with other peculiar privileges. In the archives of the house was deposited a long roll, on which were inscribed the names of the nobles and gentlemen of mark, who came with the Conqueror and survived the battle of Hastings.*

The most sanguine of the Normans, in common with the most despondent among the English, expected that immediately after the battle of Hastings the Conqueror would march straight to London and make himself master of that capital. But the first move was a retrograde one; nor did William establish himself in the capital until more than two months had passed. While the army of Harold kept the field at Senlac, or Battle, several new ships, with reinforcements, came over from Normandy to join William. Mistaking the proper place for landing, the commanders of these vessels put in to Romney, where they were at once assaulted and beaten by the people of the coast. William learned this unpleasant news the day after his victory, and to save the other recruits, whom he still expected, from a similar disaster, he resolved before proceeding farther to make himself master of all the south-eastern coast. He turned back, therefore, from Battle to Hastings, at which latter place he stayed some days awaiting his transports from beyond sea, and hoping, it is said, that his presence would induce the population of those parts to make voluntary submission. At length, seeing that no one came to ask for peace, William resumed his march with the remnant of his army and the fresh troops which had arrived in the interval from Normandy. The amount of this seasonable reinforcement is nowhere mentioned, but there are good reasons for believing that it must have been considerable. He kept close to the sea-coast, marching from south to north, and spreading devastation on his passage. He took a savage vengeance at Romney for the reverse his troops had sustained there, by massacring the inhabitants and burning their houses. From Romney he advanced to Dover, the strongest place on the coast,—"the lock and key of all England," as Holinshed calls it. With little or no opposition, he burst into the town, which his troops set fire to; and the strong castle, which the son of Godwin had put into an excellent state of defence, was so speedily surrendered to him that a suspicion of treachery rests on the Saxon commander. The capture of this fortress was most opportune and important, for a dreadful dysentery had broken out in the Norman army, and a safe receptacle for the sick had become indispensable. Dover Castle also commanded the

* The original roll of Battle Abbey is lost; but some copies have been preserved, from which the document has been repeatedly printed. It is believed, however, that these pretended transcripts are far from faithful, and that, besides other corruptions, many names have been inserted in later times by the monks of the Abbey, to gratify families or individuals that wished to make it appear they were sprung from followers of the Conqueror.

best landing-place for troops from the continent, and William was not yet so sure of his game as not to look anxiously for a place of retreat on the coast in case of meeting with reverses in the interior. He spent eight or nine days in strengthening the castle and repairing some of the damage done to the town by his lawless soldiery. Meanwhile, in order to conciliate the inhabitants, he made them some compensation for the losses and injuries they had sustained; and in the same interval he received more recruits from Normandy. The historian who would pretend to write a complete and consecutive account of these obscure times must have recourse to his imagination, or to some hitherto undiscovered documents, for the chronicles and original documents we possess will not enable him to accomplish such a task. In the particular transactions we are relating, the naval forces ought to have had some share, more or less important, but we have no means of telling what steps were taken either by the English or the Norman fleet. Just before the battle of Hastings, the former of these blockaded the latter. Did the defeat and death of Harold induce the English seamen to disperse? or did they from that moment place themselves under the command of Godwin and Edmund, Harold's sons, who certainly re-appeared, with a considerable portion of the English navy, against William in the course of the following year? According to some accounts, William burnt his ships at his first landing in England: the whole story is doubtful; but at most, he could only have destroyed the rude vessels he had hastily constructed for the passage. What became of the better class of ships which were mainly supplied by his great lords and the foreign princes in alliance with him? Did these latter return to their own ports as soon as the English raised the blockade? or did they sail round the coast and enter the Thames, co-operating with William in his advance, and making diversions in his favour? No positive answer can be given to these queries.

When the Conqueror moved from Dover, he ceased to creep cautiously round the coast, but, penetrating into Kent, marched direct to London. A confused story is told by some of our early historians about a popular resistance organised by Archbishop Stigand and the Abbot Egelnoth, in which the men of Kent, advancing like the army of Macduff and Siward against Macbeth, under the cover of cut-down trees and boughs, disputed the passage of the Normans, and, with arms in their hands, exacted from them terms most favourable to themselves and the part of England they occupied. But the plain truth seems to be, that, overawed by the recent catastrophe of Hastings, and the presence of a compact and numerous army, the inhabitants of Kent made no resistance, and meeting William with offers of submission, placed hostages in his hands, and so obtained mild treatment.

During these calamities, the Saxon Witan had assembled in London to deliberate and provide for the future; but evidently, as far as the lay portion of the meeting was concerned, with no intention of submitting to the Conqueror. The first care that occupied their thoughts was to elect a successor to the throne. Either of Harold's brave brothers, at such a crisis when valour and military skill were the qualities most wanted, might probably have commanded a majority of suffrages; but they had both fought their last fight; and, owing to their youth, their inexperience, their want of popularity, or to some other circumstance, the two sons of Harold seem never to have been thought of. Many voices would have supported Morcar or Edwin, the powerful brothers-in-law of Harold, who had already an almost sovereign authority in Northumbria and Mercia; but the citizens of London, and the men of the south of England generally, preferred young Edgar Atheling, the imbecile son of Edmund Iron-side, who had been previously set aside on account of his little worth; and when Stigand the primate, and Aldred the Archbishop of York, threw their weight into this scale, it outweighed the others, and Edgar was proclaimed king. It should seem, however, that even at this stage, many of the bishops and dignified clergymen, who were even then Frenchmen or Normans, raised their voice in favour of William, or let fall hints that were all meant to favour his pretensions. The Pope's bull and banner could not be without their effect, and, motives of interest and policy apart, some of these ecclesiastics may have conscientiously believed they were performing their duty in promoting the cause of the elect of Rome. Others there were who were notoriously bought over, either by money paid beforehand or by promises of future largess.

The party that ultimately prevailed in the Witan did not carry their point until much precious time had been consumed; nor could the blood of Cerdic, Alfred, and Edmund, make the king of their choice that rallying point which conflicting factions required, or a hero capable of facing a victorious invader, advancing at the head of a more powerful army than England could hope to raise for some time. In fact, Edgar was a mere cipher; a stripling incapable of government as of war,—with nothing popular about him except his descent. The primate Stigand took his place at the council board, and the military command was given to earls Edwin and Morcar. A very few acts of legal authority had been performed in the name of Edgar, when William of Normandy appeared before the southern suburb of London. If the Normans had expected to take the capital by a *coup-de-main*, and at once, they were disappointed; the Londoners were very warlike; and the population of the city, great even in those days, was much increased by the presence of the thanes and chiefs of all the neighbouring counties, who had come in to attend the Witan, and had brought their servants and followers with them. After making a successful charge with 500 of his best horse against some citizens who were gathered on that

side of the river, William set fire to Southwark, and marched away from London with the determination of ravaging the country around it, destroying the property of the thanes who had assembled at the Witan, and, by interrupting all communication, inducing the well-defended capital to surrender. Detachments of his army were soon spread over a wide tract; and in burning towns and villages, and the massacre of men armed and men unarmed, and in the violation of helpless females, the people of Surrey, Sussex, Hampshire, and Berkshire, were made to feel the full signification of a Norman conquest. William crossed the Thames at Wallingford, near to which place he established an entrenched camp, where a division of his army was left in order to cut off any succours that might be sent towards London from the west. This done, he proceeded across Buckinghamshire into Hertfordshire, "slaying the people," till he came to Berkhampstead, where he took up a position in order to interrupt all communication with London from the north. The capital, indeed, at this time seems to have been girded round by the enemy, and afflicted by the prospect of absolute famine. Nor were there wanting other causes of discouragement. The earls Edwin and Morcar showed little zeal in the command of a weak, and, as yet, unorganized army, and soon withdrew towards the Humber, taking with them all the soldiers of Northumbria and Mercia, who constituted the best part of King Edgar's forces, but who looked to the earls much more than to the king. These two sons of Alfgar probably hoped to be able to maintain themselves in independence in the north, where, in reality, they at a later period renewed, and greatly prolonged, the contest with the Normans. Their departure had a baneful effect in London; and while the spirit of the citizens waxed fainter and fainter, the partisans and intriguers for William, encouraged at every move by the prevalent faction among the clergy, raised their hopes and extended their exertions.

After some time, however, earls Morcar and Edwin appear to have returned to the capital. On many an intermediate step the chroniclers are provokingly silent: but at last it was determined that a submissive deputation should be sent from London to Berkhampstead; and King Edgar himself, the Primate Stigand, Aldred, archbishop of York, Wolfstan, bishop of Worcester, with other prelates and lay chiefs, among whom the Saxon chronicler expressly names the two earls of Northumbria and Mercia, and many of the principal citizens, repaired to William, who received them with an outward show of moderation and kindness. It is related that when the man whom he most hated, as the friend of Harold and the energetic enemy of the Normans,—that when Stigand came into his presence, he saluted him with the endearing epithets of father and bishop. The puppet-king Edgar made a verbal renunciation of the throne, and the rest swore allegiance to the Conqueror; the bishops swearing for the whole body of the clergy, the chiefs for the nobility, and the citizens for the good city of London.* During a part of this singular audience, William pretended to have doubts and misgivings as to the propriety of his ascending the vacant throne; but these hypocritic expressions were drowned in the loud acclamations of his Norman barons, who felt that the crown of England was on the point of their swords. Having taken oaths of fidelity and peace, the Saxon deputies left hostages with the Norman, who, on his side, promised to be mild and merciful to all men. On the following morning the foreigners began their march towards London, plundering, murdering, and burning, just as before.† They took their way through St. Alban's. On approaching that place William found his passage stopped by a multitude of great trees which had been felled and laid across the road. The Conqueror sent for the Abbot of St. Alban's, and demanded why these barriers were raised in his jurisdiction? The abbot, Frithric or Frederick, who descended from noble Saxon blood, as also from King Canute the Dane, answered boldly, "I have done the duty appertaining to my birth and calling; and if others of my rank and profession had performed the like, as they well could and ought, it had not been in thy power to penetrate into the land thus far." ‡ Even now William did not enter London in person, but sending on part of his army to build a fortress for his reception, he encamped with the rest at some distance from the city. This fortress, which was built on the site, and probably included part of a Roman castle, grew gradually, in after times, into the Tower of London. Some accounts state that William's vanguard was hostilely engaged by the citizens, but according to others they met with no resistance, and were permitted to raise their fortifications without any serious molestation.

As soon as the Normans had finished his stronghold, William took possession of it, and then they fixed his coronation for a few days after. The Conqueror is said to have objected to the performance of this ceremony while so large a part of the island was independent of his authority; and he certainly hoped, by delaying it, to obtain a more formal consent from the English nation, or something like a Saxon election, which would be a better title in the eyes of the people than the right of conquest. Little, however, was gained by delay; and the coronation, which, for the sake of greater solemnity, took place on Christmas-day, was accompanied by accidents and circumstances highly irritating to the people. It is stated, on one side, that William invited the primate Stigand to perform the rites, and that Stigand refused to crown a man "covered with the blood of men, and the

* "Bugon tha for neode," says the Saxon Chronicle, "tha maest waes to hearm gedon; and thaet waes micel unread thaet man aeror swa ne dyde tha hit god betan nolde for urum synnum." (They submitted them for need, when the most harm was done. It was very ill advised that they did not so before, seeing that God would not better things for our sins.—Ingram's Translation.)

† Roger Hoveden.—Chron. Sax.

‡ Stow, Chron.

invader of others' rights."* Although there might have been some policy in making this great champion of the Saxon cause hallow the conqueror, it does not appear probable that William would ask this service of one who was lying under the severe displeasure of Rome; and it is said, on the other side, that he refused to be consecrated by Stigand, and conferred that honour on Aldred, Archbishop of York, whom some of the chroniclers describe as a wise and prudent man, who understood the expediency of accommodating himself to circumstances. The new Abbey of Westminster, the last work of Edward the Confessor, was chosen as the place for the coronation of our first Norman king. The suburbs, the streets of London, and all the approaches to the Abbey, were lined with double rows of soldiers, horse and foot. The Conqueror rode through the ranks, and entered the Abbey church, attended by 260 of his warlike chiefs, by many priests and monks, and a considerable number of English, who had been gained over to act a part in the pageantry. At the opening of the ceremony one of William's prelates, Geoffrey, the Bishop of Coutances, asked the Normans, in the French language, if they were of opinion that their chief should take the title of King of England? and then the Archbishop of York asked the English if they would have William the Norman for their king? The reply on either side was given by acclamation in the affirmative, and the shouts and cheers thus raised were so loud that they startled the foreign cavalry stationed round the Abbey. The troops took the confused noise for a cry of alarm raised by their friends, and, as they had received orders to be on the alert and ready to act in case of any seditious movement, they rushed to the English houses nearest the Abbey, and set fire to them all. A few, thinking to succour their betrayed duke and the nobles they served, ran to the church, where, at sight of their naked swords, and the smoke and flames that were rising, the tumult soon became as great as that without its walls. The Normans fancied the whole population of London and its neighbourhood had risen against them; the English imagined that they had been duped by a vain show, and drawn together unarmed and defenceless, that they might be massacred. Both parties ran out of the Abbey, and the ceremony was interrupted, though William, trembling from head to foot, and left almost alone in the church, or with none but the Archbishop Aldred and some terrified priests of both nations near him at the altar, decidedly refused to postpone the celebration. The service was therefore completed amidst these bad auguries, but in the utmost hurry and confusion, and the Conqueror took the usual coronation oath of the Anglo-Saxon kings, making, as an addition of his own, the solemn promise that he would treat the English people as well as the best of their kings had done.†

Meanwhile the commotion without continued, and it is not mentioned at what hour of the day or night the conflagration ended. The English, who had been at the Abbey, ran to extinguish the fire, —the Normans, it is said, to plunder, and otherwise profit by the disorder; but it appears that some of the latter exerted themselves to stop the progress of the flames, and to put an end to a riot peculiarly unpalatable to their master, whose anxious wish was certainly, at that time, to conciliate the two nations. At this, as at several subsequent stages of the conquest, William could not prevent the wrongs done by his disorderly and rapacious soldiery, who gave but slight tokens of that superiority in civilization which has so generally been challenged for the Normans.

Soon after his inauspicious coronation William withdrew from London to Barking, where he established a court which gradually attracted many of the nobles of the south of England. Edric, surnamed the Forester, Coxo, a warrior of high repute, and others, are named; and as William extended his authority, and laid aside the harshness of a conqueror, even the thanes and the great earls from the north, where the force of his arms was not yet felt, repaired to do him homage. Turchil, Siward, and Aldred, all northern chiefs of the highest rank, are mentioned by a contemporary chronicler, as among those that presented themselves to perform the same painful ceremony which had previously been submitted to by earls Edwin and Morcar, the brothers-in-law of the late king. In return for the homage thus rendered, William granted them the confirmation of their estates and honours which he had not at present the power to seize or invade. It appears that the Conqueror's first seizures and confiscations, after the crown lands, were the domains of Harold and his brothers Gurth and Leofwin, and the lands and property of such of the English chiefs as were either very weak, or unpopular, or indifferent to the nation. But, even thus limited, the spoils of the south are represented as prodigious

Edgar Atheling, whose moral nullity secured him from suspicion and danger, was an inmate of the new court, and William, knowing he was cherished by many of the English on account of his descent, pretended to treat him with great respect, and left him the earldom of Oxford, which Harold had conferred on him when he ascended the throne in his stead. From Barking the new king made a progress through the territory, that was rather militarily occupied than securely conquered, displaying as he went as much royal pomp, and treating the English with as much courtesy and consideration, as he could. The extent of this territory cannot be exactly determined, but it appears the Conqueror had not yet advanced, in the north-east, beyond the confines of Norfolk, nor in the south-west beyond Dorsetshire. Both on the eastern and western coast, and in the midland counties, the invasion was gradual and slow, and as yet the city of Oxford had certainly not fallen.

* Will. of Newbury.

† Guil. Pictav.—Orderic. Vital.—Chron. Sax. Orderic says, "Trepidantes, super regem *vehementer trementem*, officium vix peregerunt."

All William's measures at this time were mild and conciliating, and some of them marked with wisdom and a laudable anxiety for the good of the country. He respected the old Anglo-Saxon laws, which, indeed, were not much disturbed or changed, at least in the letter, until the accession of Henry II., nearly a century after the Conquest. He established good courts of justice, encouraged agriculture and commerce, and (at least nominally) enlarged the privileges of London and some other towns. At the same time, however, the country he held was bristled with castles and towers, and additional fortresses erected in and around the capital showed his distrust of what was termed, in the language of the Normans, an over-numerous and too proud population. Next to London, the city of Winchester, which had been a favourite residence of the Anglo-Saxon kings

WINCHESTER.—(This is the city as it now appears. In this and similar cases the town or other place, about which an interest may be supposed to have been awakened by the narrative, will be represented in its existing state, except where an authentic engraving or drawing of older date may be considered to preserve some features now lost that belonged to it at or near the time to which the history relates.)

excited most suspicion; "for," says William of Poictiers, the Conqueror's chaplain, "it is a noble and powerful city, inhabited by a race of men rich, fearless, and perfidious." A castle was therefore erected at Winchester, and a strong Norman garrison put into it. These fortresses, hastily thrown up in the course of three or four months, could not be very large or very solid, but they answered their present end, and they were subsequently increased in size and strength. Such operations could not be otherwise than distasteful to the English, who were further irritated by seeing proud foreign lords fixed among them, and married to the widows and heiresses of their old lords who had fallen at Hastings. The rapacious followers of William were hard to satisfy; and, to secure their attachment, he was frequently obliged to go beyond those bounds of moderation he was inclined to set for himself. A most numerous troop of priests and monks had come over from the continent, and their avidity was scarcely inferior to that of the barons and knights. Nearly every one of them wanted a church, a rich abbey, or some higher promotion; and at a very early period of his occupation the Conqueror began to gratify their wishes. To pass over other wrongs and provocations inseparable from foreign conquest, and, in good part, indeed, inseparable even from a change of dynasty, the people presently saw the coming on of that sad state of things which they soon after suffered, "when England became the habitation of new strangers, in such wise, that there was neither governor, bishop, nor abbot remaining therein of the English nation."* It was, however, to these foreign churchmen that our country was chiefly indebted for whatever intellectual improvement or civilization was imported at the Conquest.

In the midst of this universal hungering after the domains and benefices of the English evinced

* Holinshed.

by lay and clergy of all degrees, one single instance is recorded of a most marvellous abstinence. There was one of the Norman warriors who neither asked for estates nor a rich English wife, and who would not accept any part of the spoils taken from the conquered. He said he had accompanied his liege lord the Duke William into England, because such was his duty as a true and faithful vassal, but that property seized and stolen from other men did not tempt him,—that he should return to Normandy, there to enjoy his moderate but lawful inheritance, and rest content with his own lot, without coveting the portion of others. The name of this wise man, which ought not to be permitted to perish, was Guilbert, the son of Richard.*

In the month of March, 1067, the English in the north and west being yet untouched, and their countrymen in the south beginning to harbour violent feelings—while the Normans were anxious to provoke an insurrection, and prosecute the war in the land where so many broad acres remained to reward the victors,—William resolved to pass over into Normandy. Many ingenious surmises have been made as to the motives which induced him to take this journey at this crisis; and historians may still speculate without coming to any positive conclusion borne out by contemporary evidence. Although, as he admits, no ancient writer has ascribed such a purpose and plan to the Conqueror, we are disposed to suspect, with Hume, that in this extraordinary step he was guided by a concealed policy, and that though he had thought proper at first to allure the people to submission, he found that he could neither satisfy his followers, nor secure his unstable government, without further exerting the right of conquest, and seizing the remaining possessions of the English,—that in order to have a pretext for this violence, he was anxious they should break out into insurrections which could hardly prove dangerous to him while he detained all the principal English nobility in Normandy, while his great and victorious army was placed in strongholds in England, and while he himself was so near at hand to crush any insurrection. That he made the journey, as some have thought, out of a vain eagerness to show himself as the conqueror of England to his subjects in Normandy, is a supposition not consistent with his character; and that he crossed the sea merely to put the booty he had made in a place of safety, does not appear very probable.

Had he determined to vex and rouse the English, he could scarcely have left a more fitting instrument than his half-brother, Odo, to whom he confided the royal power during his absence, associating with him as counsellors of state William Fitz-Osborn, Hugo of Grantmesnil, Hugo de Montfort, Walter Gifford, and William de Garenne. The Conqueror carried in his train Stigand, the archbishop of Canterbury, the abbot Egelnoth, Edgar Atheling, Edwin, earl of Mercia, Morcar, earl of Northumbria, Waltheof, earl of Northampton and Huntingdon, and many others of high nobility.

The place chosen for his embarkation was Pevensey, near Hastings; and when he had made a liberal distribution of money and presents to a part of his army which had followed him to the beach, he set sail with a fair wind for Normandy, just six months after his landing in England. According to every account, he was received with enthusiastic joy by his continental subjects, who were filled with wonderment at his success and the quantity of gold and silver and other precious effects he brought back with him. A part of this wealth, the fruit of blood and plunder, was sent to the pope with the banner of Harold, which had been taken at the battle of Hastings, and another portion was distributed among the abbeys, monasteries, and churches of Normandy; "neither monks nor priests remaining without a guerdon." William gave them coined gold, and gold in bars, golden vases, and, above all, richly embroidered stuffs, which on high feast-days they hung up in their churches, where they excited the admiration of all travellers and strangers. The whole of the account given by William's chaplain tends to raise our idea of the wealth of England. "That land," says the Poictevin, "abounds more than Normandy in the precious metals. If in fertility it may be termed the granary of Ceres, in riches it should be called the treasury of Arabia. The English women excel in the use of the needle and in embroidering in gold; the men in every species of elegant workmanship. Moreover, the best artists of Germany live amongst them; and merchants, who repair to distant countries, import the most valuable articles of foreign manufacture unknown in Normandy." The same contemporary informs us, that at the feast of Easter, which William held with unusual splendour, a relation of the king of France, named Raoul, came with a numerous retinue to the Conqueror's court, where he and his Frenchmen, not less than the Normans, considered with a curiosity, mingled with surprise, the chased vases of gold and silver, brought from England; and, above all, the drinking-cups of the Saxons, made of large buffalo-horns, and ornamented at either extremity with precious metal. The French prince and his companions were also much struck with the beauty of countenance and the long flowing hair of the young Englishmen William had brought over with him as guests or hostages. The chaplain adds, with amusing *naïveté*, "they remarked all those things, as also many others equally new unto them, in order that they might relate and describe them in their own country."

While all thus went on merrily in Normandy, where the presence of the Conqueror, with his foreign court, move where he would, caused the suspension of all labour, and made a general holiday, events of a very different nature were taking place on the other side of the Channel. The rule of Odo and the barons left in England pressed harshly on the people, whose complaints and cries

* *Orderic. Vital.*

for justice they despised. Without punishment or check, their men-at-arms were permitted to insult and plunder, not merely the peasants and burgesses, but people of the best condition, and the cup of misery and degradation was filled up, as usual in such cases, by violence offered to the women. The English spirit was not yet so depressed, and in fact never sank so low as to tolerate such wrongs. Several popular risings took place in various parts of the subjugated territory, and many a Norman, caught beyond the walls of his castle or garrison-town, was cut to pieces. These partial insurrections were followed by concerted and extensively combined movements. A grand conspiracy was formed, and the Conqueror's throne was made to totter before it was nine months old. The men of Kent, who had been the first to submit, were the first to attempt to throw off the yoke. A singular circumstance attended their effort. Eustace, count of Boulogne, the same who had caused such a stir at Dover in the time of Edward the Confessor,* was then in open quarrel with William the Norman, who kept one of his sons in prison. This Eustace was famed far and wide for his military skill; and his relationship to the sainted King Edward, whose sister he had married, made the English consider him now in the light of a natural ally. Forgetting, therefore, their old grievances, the people of Kent sent a message to Count Eustace, promising to put Dover into his hands, if he would make a descent on the coast, and help them to wage war on their Norman oppressors. Eustace most readily accepted the invitation, and, crossing the Channel with a small but chosen band, he landed under favour of a dark night, at a short distance from Dover, where he was presently joined by a host of Kentish men in arms. A contemporary says, that had they waited but two days, these insurgents would have been joined by the whole population of those parts, but they imprudently made an attack on the strong castle of Dover, were repulsed with loss, and then thrown into a panic by the false report that Bishop Odo was approaching them with all his forces. Count Eustace fled, and got safely on board ship, but most of his men-at-arms were slain or taken prisoners by the Norman garrison, or broke their necks by falling over the cliffs on which Dover Castle stands. The men of Kent, with a few exceptions, found their way home in safety, by taking by-paths and roads with which the Normans were unacquainted.

In the west the Normans were much less fortunate. Edric the Forester, who had visited the Conqueror at Barking, and done homage to him, was the lord of extensive possessions that lay on the Severn and the confines of Wales. This powerful chief was at first desirous of living in peace, but being provoked at the depredations committed by some Norman captains who had garrisoned the city of Hereford, he took up arms, and forming an alliance with two Welsh princes, he was enabled to shut the foreigners close up within the walls of the town, and to range undisputed master of all the western part of Herefordshire.

If there had been but one bright national idol—one prince or chief of ability or popularity to unite and lead them—the English would have cleared the country of its invaders. At this favourable moment the two sons of King Harold appeared in the west; but though they were nearly a year older than at the time they were passed over unnoticed by the Witan assembled at London, they soon showed that neither of them had the qualities required, or was destined to be the saviour of the Anglo-Saxon nation. Their proceedings would be altogether inexplicable if we did not reflect that they were allied with, and probably controlled by, a host of pirates. These two young men sailed over from Ireland with a considerable force, embarked in sixty ships. They ascended the Bristol Channel and the river Avon, and landing near Bristol, plundered that fertile country. Whatever were the pretexts and claims set forth by the sons of Harold, they acted as common enemies, and were met as such by the English people, who repulsed them when they attempted to take the city of Bristol, and soon after defeated them upon the coast of Somersetshire, whither they had repaired with their ships and plunder. There was no Norman force in those parts, nor was it considered necessary to send one. The whole defence was made by the English, commanded by their own countryman Ednoth, who fell, with many of his followers, in the battle. The invaders, who also suffered severely, took to their ships, and returned to Ireland immediately after the defeat. In Shropshire, Nottinghamshire, and other parts of the kingdom, both where they had felt the Norman oppression, and where, as yet, they only apprehended it, bodies of English rose in arms, and urged their neighbours to join them. It is related that Earl Coxo, who had appeared at Barking, and been much honoured by William, was slain by his vassals because he refused to head them in an insurrection; but it seems the death of that chief took place before the Conqueror left England, and there is some doubt whether he was really killed by his vassals, or by another English nobleman, his rival. There is, however, no doubt but that the indignation of the people was general, and that, encouraged by the Conqueror's absence, efforts were made, and others contemplated, for throwing off the yoke. Rumours spread that a simultaneous massacre, like that perpetrated on the Danes, was intended; and it was equally natural that the English should make use of such threats in their moments of rage, and that the Normans, conscious of oppression, and well versed in the history of St. Brice's day, should believe them and tremble at them. Letter after letter, and message after message, were sent into Normandy; but the Conqueror, either because he was insensible to the alarm, or thought sufficient provocation had not been given, lingered there for more than eight months. When

* See p. 189, ante.

at last he departed, it was in hurry and agitation. He embarked at Dieppe on the 6th of December, and sailed for England by night. On arriving, he placed new governors, whom he had brought from Normandy, in his castles and strongholds in Sussex and Kent. On reaching London he was made fully sensible of the prevailing discontent; but with his usual crafty prudence he applied himself to soothe the storm for awhile, deeming that the time had not yet arrived for his openly declaring that the fickle, faithless English were to be exterminated or treated as slaves, and all their possessions and honours given to the Normans. He celebrated the festival of Christmas with unusual pomp, and invited many Saxon chiefs to London to partake in the celebration. He received these guests with smiles and caresses, giving the kiss of welcome to every comer.* If they asked for any thing, he granted it; if they announced or advised any thing, he listened with respectful attention; and it should seem that they were nearly all the dupes of these royal artifices. He then propitiated the citizens of London by a proclamation, which was written in the Saxon language, and read in all the churches of the capital. "Be it known unto you," said this document, "what is my will. I will that all of you enjoy your national laws as in the days of King Edward; that every son shall inherit from his father, after the days of his father; and that none of my people do you wrong." William's first public act after all these promises was to impose a tax, which was made more and more burdensome as his power increased.

The war of 1068, or what may be called the Conqueror's second campaign in England, opened in the fertile province of Devonshire, where the people, supported by their hardy neighbours of Cornwall, and animated by the presence of the mother and some other relations of King Harold, refused to acknowledge his government, and had prepared to resist the advance of his lieutenants. Some of the thanes, to whom the command of the insurrection had been intrusted, proved cowards or traitors; the Normans advanced, burning, and destroying, and breathing vengeance; but the men of Exeter, who had had a principal share in organizing the patriotic resistance, were resolute in the defence of their city. Ever since the days of Athelstan, Exeter had been increasing in trade and consideration, and now it was a well-peopled city, surrounded by a strong wall. Githa, or Editha, Harold's mother, had fled there after the battle of Hastings, and carried with her considerable riches. In no part of England was the Norman name more odious, for, young and old, the citizens hated to death the whole race of Frenchmen. This feeling had been recently displayed by the populace in a cruel attack made upon some Norman ships that were driven upon their coast by a storm. When the Conqueror came within four miles of Exeter he summoned the citizens to submit, and take the oath of fealty. They replied, "We will not swear fealty to this man, who pretends to be our king, nor will we receive his garrison within our walls; but if he will receive as tribute the dues we were accustomed to pay to our kings, we will consent to pay them to him." To this somewhat novel proposal William said, "I would have subjects, and it is not my custom to take then on such conditions."* Some of the magistrates and wealthiest of the citizens then went to William, and, imploring his mercy, proffered the submission of the city, and gave hostages; but the mass of the population either did not sanction this proceeding or repented of it, and when William rode up at the head of his cavalry he found the gates barred and the walls manned with combatants, who bade him defiance. The Normans, in sight of the men on the ramparts, then tore out the eyes of one of the hostages they had just received; but this savage act did not daunt the people, who were well prepared for defence, having raised new turrets and battlements on the walls, and brought in a number of armed seamen, both native and foreigners, that happened to be in their port. The siege which followed lasted eighteen days, and cost William a great number of men; and when the city surrendered at last, if we are to believe the Saxon chronicle, it was because their chiefs had again betrayed them. The brave men of Exeter, however, obtained much more favourable terms than were then usual; for though they were forced to take the oath, and admit a Norman garrison, their lives, property, and privileges were secured to them, and successful precautions were taken by the Conqueror to prevent any outrage or plunder. During the siege we hear of a strong body of English, in the pay of the Conqueror, fighting against their own countrymen,—a fatal example which was soon followed in other parts of the kingdom. Having ordered a strong castle to be built in the captured town, William returned eastward to Winchester, where he was joined by his wife Matilda, who had not hitherto been in England. At the ensuing festival of Whitsuntide she was publicly crowned by Aldred, the archbishop of York; and as this ceremony, in regard to a king's wife, was contrary to an old law of the Anglo-Saxons (which, however, had been disregarded on some former occasions), it displeased the people, who were further irritated against Matilda by seeing a large share of the confiscated territory in the west assigned to her. On the surrender of Exeter the aged Githa, with several ladies of rank, escaped to Bath, and finding no safety there, they fled to the small islands at the mouth of the Severn, where they lay concealed until they found an opportunity of passing over to Flanders.

Harold's sons, Godwin and Edmund, with a younger brother named Magnus, again came over from Ireland about Midsummer, and with a fleet about equal to the one they had brought the preceding year they hovered off the coasts of Devon-

ROUGEMONT CASTLE, EXETER. Founded by William the Conqueror.—From a Print dated 1725.

shire and Cornwall, landing occasionally and inviting the people to join them against the Normans. Nothing could be more absurdly concerted than these movements. Had they appeared a little earlier, while Exeter held out, their presence might have been most important; but now the sons of Harold were left to shift for themselves, and having imprudently ventured too far from the shore without any information as to the state of the country, they were suddenly attacked by a Norman force from Exeter, under Earl Beorn, and defeated with great slaughter. It appears they were even ignorant of the facts that the city of Exeter had fallen, and that their mother had fled to a foreign country. Their means were now exhausted, and, wearied by their ill success, their Irish allies declined giving any further assistance to these exiles. The sons of Harold next appeared as suppliants at the court of Sweyn, king of Denmark.

During the spring and early summer of this same year (1068), William established his authority in Devonshire, Somersetshire, and Gloucestershire, and besides taking Exeter, made himself master of Oxford and other fortified cities which he had left in his rear when he advanced into the West. Wherever his dominion was imposed, the mass of land was given to his lords and knights, and fortresses and castles were erected and garrisoned by Normans and other foreigners, who continued to cross the Channel in search of employment, wealth, and honours. The meanest of these exotic adventurers,—the least cultivated of these vagabonds,—thought himself entitled to treat the best Englishman with contempt, as a slave and barbarian.

The accounts of the sufferings of the conquered people, as given by the native chroniclers, are condensed in a striking passage of Holinshed:—"He took away from divers of the nobility, and others of the better sort, all their livings, and gave the same to his Normans. Moreover, he raised great taxes and subsidies through the realm; nor anything regarded the English nobility, so that they who before thought themselves to be made for ever by bringing a stranger into the realm, did now see themselves trodden under foot, to be despised, and to be mocked on all sides, insomuch that many of them were constrained (as it were, for a further testimony of servitude and bondage) to shave their beards, to round their hair, and to frame themselves, as well in apparel as in service and diet at their tables, after the Norman manner, very strange and far differing from the ancient customs and old usages of their country. Others utterly refusing to sustain such an intolerable yoke of thraldom as was daily laid upon them by the Normans, chose rather to leave all, both goods and lands, and, after the manner of outlaws, got them to the woods with their wives, children, and servants, meaning from thenceforth to live upon the spoil of the country adjoining, and to take whatsoever came next to hand. Whereupon it came to pass within a while that no man might

travel in safety from his own house or town to his next neighbours, and every quiet and honest man's house became, as it were, a hold and fortress furnished for defence with bows and arrows, bills, pole-axes, swords, clubs, and staves, and other weapons, the doors being kept locked and strongly bolted in the night season, as it had been in time of open war, and amongst public enemies. Prayers were said also by the master of the house as though they had been in the midst of the seas in some stormy tempest; and when the windows or doors should be shut in and closed, they used to say *Benedicite*, and others to answer *Dominus*, in like sort as the priest and his penitent were wont to do at confession in the church."

The bands of outlaws thus formed of impoverished, desperate men, were not suppressed for several successive reigns; and while the Normans considered and treated them as banditti, the English people long regarded them in the light of unfortunate patriots. As late as the reign of King John, popular tradition gives some of its brightest colours to Robin Hood and his outlaws who haunted Sherwood Forest; nor was this dangerous sympathy suppressed till the memory of the Saxon supremacy had waxed faint, and the conquering and conquered races, being fused into one nation, enjoyed an equality of laws and rights.

Men of higher rank and more extended views were soon among the fugitives from the pale of the Conqueror. When in his conciliating mood, William had promised Edwin, earl of Mercia, one of his daughters in marriage, and flattered by the prospect of such a prize, this powerful brother-in-law of Harold had rendered important services to the Norman cause; but now, when he asked his reward, the Conqueror not only refused the fair bride, but insulted the suitor. Upon this Edwin, with his brother Morcar, absconded from the Norman court and went to the north of England, there to join their incensed countrymen and make one general effort for the recovery of their ancient liberties. They were followed by the good wishes of the poor people of the South; and such of the priests and monks of English race who were not yet dispossessed, secretly offered up prayers for their success in their cells and churches. No foreign soldier had as yet passed the Humber; and it was behind that river that Edwin and Morcar fixed the great camp of independence, the most southern bulwark of which was the fortified city of York. Among the men of Yorkshire and Northumbria they found some thousands of hardy warriors who swore they would not sleep under the roof of a house till the day of victory, and they were joined by some allies from the mountains of Wales and other parts. The ever-active Conqueror, however, came upon them before they were pre-

York. From the Ancient Ramparts

pared. His march, considering the many obstacles he had to overcome, was wonderfully rapid. Advancing from Oxford, he took Warwick and Leicester, the latter of which places he almost entirely destroyed. Then crossing the Trent, which he had not seen till now, he fell upon Derby and Nottingham. From Nottingham he marched upon Lincoln, which he forced to capitulate and deliver hostages, and thence pressing forward might and main, he came to the river Ouse, near the point where it falls into the Humber. Here he found Edwin and Morcar drawn out to oppose him. The battle which immediately ensued was fierce in the extreme; but, as at Hastings, their superiority in number, arms, armour, and discipline, gave the Normans the victory. A great number of the English perished; the rest retreated to York, within the walls of which they hoped to find refuge; but the conquerors following them closely, broke through the walls and entered the city, destroying everything with fire and sword, and massacring all they found, from the boy, as a contemporary authority assures us, to the old man.* The wreck of the patriotic army fled to the Humber, and descended that estuary in boats: they then turned to the north, and landed in the country of the Scotch, or in the territory near the borders, which became the places of refuge of all the brave men of the north, who did not yet despair of liberty, or who, at all hazards, were resolved not to submit to slavery.

The victors, who were not prepared to advance farther, built a strong citadel at York, which became their advanced post and bulwark towards the north. A chosen garrison of 500 knights and men-at-arms, with a host of squires, and servants-at-arms, was left at this dangerous post. So perilous indeed was it considered, from the well-known martial and obstinate character of the men that dwelt beyond its walls, that the Normans laboured day and night to strengthen their position, forcing the poor inhabitants of York who had escaped the massacre to dig deep ditches and build strong walls for them. Fearing to be besieged in their turn, they also collected all the stores and provisions they could. At this crisis Aldred, the Archbishop of York, the prelate who had crowned and favoured William, came to his cathedral to celebrate a religious festival. Soon after his arrival in the city, he sent to his lands situated near York, for some corn and other provisions, for the use of his own house. As his domestics returned with pack-horses and carts loaded with these provisions, they met at the gate of the town the Norman Viscount or Governor of York, surrounded by a great retinue; and though the servants told him they were the Archbishop's people, and that the provisions were for the Archbishop's own use, the Governor caused the corn to be seized and carried to his magazines in the castle. The calmness and accommodating temper of Aldred were not proof against such an outrage as this. He quitted York almost immediately, and journeyed southward to the camp of the Conqueror, before whom he presented himself in his pontifical robes, holding his pastoral staff in his hand. William rose to offer him the kiss of peace; but the prelate stood at a distance and said, "Listen to me, King William! Thou wast a foreigner, and, notwithstanding that, God wishing to punish our nation, thou obtainedst, at the price of much blood, this kingdom of England: then I consecrated thee, I blessed thee, and crowned thee with mine own hand; but now I curse thee—thee and thy race, because thou hast made thyself the persecutor of God's church and the oppressor of its ministers!"* The Norman nobles of William who were present at this strange scene half drew their swords, and would have slain the bishop where he stood, but their master, caring little for the old Saxon's curse, checked their fury and permitted him to return in peace to York, where he was soon seized with a slow but consuming malady, the offspring, it was imagined, of disappointment and grief.

In spite of his successes in the north, and his firm establishment in the midland counties, where he built castles and gave away earldoms, the Conqueror's throne was still threatened, and the country still agitated from one end to the other. The English chiefs, who had hitherto adhered to his cause, fell off, at first one by one, and then in troops together, following up their defection with concerted plans of operation against him. To these was added a fugitive of still higher rank, of whose custody the Conqueror was very negligent. At the instance of Marleswine, Cospatric, and some other noblemen "who were anxious to avoid King William's rough and boisterous dealing, and feared to be put in ward," Edgar Atheling fled by sea into Scotland, taking his mother, Agatha, the widow of Edmund Ironside, and his two sisters, Margaret and Christina, with him. These royal fugitives were received, with great honour and kindness, and conducted to his castle of Dunfermline by the Scottish monarch, Malcolm Caenmore, who, in the vicissitudes of his early life, had been himself an exile, and had experienced in England the hospitality of Edward the Confessor and of many of his nobility. Edgar's sister Margaret was young and handsome; "and in process of time the said King Malcolm cast such love unto the said Margaret, that he took her to wife."† Some of the English nobles had preceded Edgar to Scotland; many followed him, encouraged by the reception they met with from the king, who was naturally anxious to strengthen himself against the growing power of William; and these emigrants, and others that arrived from the same quarter on various subsequent occasions, became the stocks of a principal part of the Scottish nobility.

It is probable that William did not mourn much for the departure of the English thanes; but presently he was vexed and embarrassed by the departure of some of his Norman chiefs and many of the soldiers of fortune that had followed him from the continent. These warriors, wearied by the

* Guil. Gemet.

* J. Stubbs. Chron. † Grafton.

constant surprises and attacks of the English, and seeing no term to that desultory and destructive warfare, longed for the quiet of their own homes. Some considered themselves enriched enough by the plunder they had made: others thought that estates in England were not worth the trouble and danger with which they were to be obtained and secured: others, again, wanted to join their wives, who were constantly pressing them to return to them and their children; for it appears that few or none of them had as yet thought it safe to bring their families to England. The latter class of complainants were made the subjects of raillery and bitter sarcasm; for William, who had his own spouse with him, found it unseemly that man and wife should wish to be together.* It was also whispered that those who asked leave to retire must all be cowards, to think of abandoning their liege lord when in peril and in the midst of foreigners. Not counting wholly on the effect of such light artillery, William tried to reanimate their zeal by offers more bountiful than ever, and by promising lands, money, and honours in abundance the moment the conquest of England should be completed. In spite, however, of all these manœuvres, Hugh de Grantmesnil, earl of Norfolk, his brother-in-law, Humphrey Tilleuil, the warden of Hastings Castle, and a great number of others, retired from the service, and recrossed the Channel. The king punished this desertion by immediately confiscating all the possessions they had obtained in our island. Foreseeing, however, that he was about to be surrounded by great difficulties and dangers, he sent his own wife Matilda back to Normandy, that she might be in a place of safety. At the same time, he invited fresh adventurers and soldiers of fortune from nearly every country in Europe; and, allured by his brilliant offers, bands flocked to him from the banks of the Rhine, the Seine, the Loire, the Garonne, and the Tagus—from the Alps, and the Italian peninsula beyond the Alps. The reinforcements he thus received must have been very considerable; for in spite of the losses he had suffered in his campaign against Edwin and Morcar, and the constant thinning of his troops by a partisan warfare, he was enabled to meet a more formidable confederacy than any previously set on foot.

A.D. 1069. The strong garrison which the Conqueror had left at York could scarcely adventure a mile in advance of that post without being attacked by the natives, who lay constantly in ambush in all the woods and glens. The governor, William Malet, was soon fain to declare that he would not answer for the security of York itself, unless prompt succour was sent him. On receiving this alarming news, William marched in person, and arrived before York just as the citizens, in league with all the country people of the neighbourhood, were laying siege to the Norman fortress. Having raised this siege by a sudden attack, he laid the foundations of a second castle in York, and, leaving a double garrison, returned southward. Soon after his departure, the English made a second attempt to drive the enemy from their fortress, but they were repulsed with loss; and the second castle and other works were finished without further interruption. Thinking themselves now secure in this advanced post, the Normans resumed the offensive, and made a desperate attempt to extend their frontier as far north as Durham. The advance was made by a certain Robert de Comine, to whom William had promised a vast territory, yet to be conquered.

This Robert set out from York with much pomp and circumstance, having assumed, by anticipation, the title of Earl of Northumberland. His army was not large, consisting only of 1200 lances; but his confidence was boundless. He crossed the Tees, and was within sight of the walls of Durham, which the Normans called "the stronghold of the rebels of the North,"—when Egelwin, the English bishop of that place, came forth to meet him, and informed him that the natives had vowed to destroy him, or be destroyed, and warned him not to expose himself with so small a force. Comine treated the warning with contempt, and marched on. The Normans entered Durham, massacring a few defenceless men. The soldiers quartered themselves in the houses of the citizens, plundering or wasting their substance; and the chief himself took possession of the bishop's palace. The march of the Normans and all these proceedings had been well noted; and when night fell, the people lighted signal-fires on the hills, that were seen as far as the Tees to the south, and as far northward as the river Tyne. The inhabitants gathered in great numbers, and hurried to Durham. At the point of day they rushed into the city, and attacked the Normans on all sides. Many were killed before they could well rouse themselves from the deep sleep induced by the fatigue of the preceding day's march and the revelry and debauch of the night. The rest attempted to rally in the bishop's house, where their leader had established his quarters. They defended this post for a short time, discharging their arrows and other missiles on the heads of their assailants, but the English ended the combat by setting fire to the house, which was burnt to the ground with Robert de Comine and all the Normans in it. The chroniclers relate, that of all the men engaged in the expedition only two escaped.

This dreadful reverse called forth a large body of troops from York, who hastened to take vengeance. These Normans advanced with sufficient confidence as far as Northallerton, about midway between York and Durham, but here they halted, as if seized with a panic, and refused to go farther. A report was spread, and believed, at least by the English, that they were struck motionless by supernatural agency—by the power of St. Cuthbert, whose body, after many removals, now reposed in Durham, and who, it was thought, protected his last resting-place.

* The abuse fell chiefly on the poor wives in Normandy.—Orderic.

When the Northumbrians struck the blow at Durham, they were expecting powerful allies, who soon arrived. As we have so often had occasion to repeat, these men, with the inhabitants of most of the Danelagh, were exceedingly fierce and warlike, and chiefly of Danish blood. Many of the old men had followed the victorious banner of the great Canute into England, or had served under his sons, kings Harold Harefoot and Hardicanute; and the sons of these old warriors were now in the vigour of mature manhood. They had always maintained an intercourse with Denmark, and as soon as they saw themselves threatened by the Normans, they applied to that country for assistance. The court of the Danish king was soon crowded by supplicants from the Danelagh, from Norwich and Lincoln, to York, Durham, and Newcastle. There were also envoys from other parts of the kingdom, where the Saxon blood predominated, and the sons of King Harold added their efforts to urge the Danish monarch to the invasion of England. At the same time, the men of Northumberland had opened a correspondence with Malcolm Caenmore and his guest Edgar Atheling, and allied themselves with the English refugees in Scotland and on the border. Even supposing that the sons of Harold made no pretensions to the crown, there must have been some jealousy and confusion in this confederacy, for while one party to it held the weak Edgar as legitimate sovereign, another maintained that by right of succession the king of Denmark was king of England. It seems well established that the Danish monarch, Sweyn Estridsen, held the latter opinion; and the ill success of the confederacy may probably be attributed to the disunion inevitably arising from such clashing interests and pretensions. As soon as the battle of Hastings was known, and before any invitations were sent over, Sweyn had contemplated a descent on England. To avert this danger, William had recourse to Adelbert, the archbishop of Bremen, who, won by persuasion and presents of large sums of money, undertook the negotiation, and endeavoured to make the Danish king renounce his project.

Two years passed without anything more being heard of the Danish invasion; but this lapse was probably rather owing to a desire on Sweyn Estridsen's side, to gain time in order to make his preparations, than to the effects of the Archbishop's diplomacy; and when in this, the third year after the battle of Hastings, the solicitations of the English emigrants were more urgent than ever, and the men of the north, his natural allies, were up in arms, the powerful Dane dispatched a fleet of 240 sail, with orders to act in conjunction with the King of Scotland and the Northumbrians. The army embarked in this fleet was composed of almost as many heterogeneous materials as the mercenary force of William: besides Danes and Holsteiners, there were Frisians, Saxons, Poles, and adventurers from other countries, tempted by the hope of plunder.* The Danish king sent his two sons, Harold and Canute, with the expedition, and placed it under the supreme command of their uncle Osbeorn, who was accompanied by five Danish chiefs of high renown, and by Christian, the king's bishop. After alarming the Normans in the south-east, at Dover, Sandwich, and Ipswich, the Danes went northward to the Humber, so often ascended by their ancestors, and sailed up that estuary to the Ouse, where they landed about the middle of August. It appears that Osbeorn was not able to prevent his motley army from plundering and wasting the country. As soon, however, as the Anglo-Danes, the men of Yorkshire and Northumberland, were advised of the arrival of the armament, they flocked to join it from all parts of the country; and Edgar Atheling, with Marlswine, Cospatric, Waltheof, the son of Siward, the great enemy of Macbeth, Archil, the five sons of Carl, and many other English nobles, arrived from the frontiers of Scotland, bearing the consoling assurance that, in addition to the force they brought with them, Malcolm Caenmore was advancing with a Scottish army to support the insurgents. York was close at hand, and they determined to commence operations by the attack of the Norman fortifications in that city. Archbishop Aldred, who had never recovered from the wrong done him the preceding year, was in York at the time: as he saw the fierce array advance on that devoted city, he prayed to God to remove him from this world, that he might not witness the total ruin of his country and the destruction of his church; and he is said to have died of "very grief and anguish of mind," before the confederates entered the city. The Normans had rendered the walls of the town so strong that they defended them seven days: on the eighth day of the siege they set fire to the houses that stood near their citadels, in order that their assailants might not use the materials to fill up the ditches of the castles, and then they shut themselves up within those lines. A strong wind arose,—the flames spread in all directions; the Minster, or cathedral church, with its famous library, and great part of the city, was consumed; and even within their castles the Normans saw themselves threatened with a horrid death by the fire they had kindled. Preferring death by the sword and battle-axe to being burnt alive, they made a sally, and were slain almost to a man by an enemy far superior in number, and inflamed with the fiercest hatred. They had suffered no such loss since the ever-memorable fight of Hastings; 3000 Normans and mercenaries of different races fell; and only William Malet, the governor of York, with his wife and children, Guilbert of Ghent, and a few other men of rank, were saved and carried on board the Danish fleet, where they were kept for ransom. Such parts of the city of York as escaped the conflagration were occupied by Edgar Atheling, who, according to some authorities, assumed the royal title, and exercised the rights of sovereignty,—circumstances, we should think, that could scarcely coincide with the views

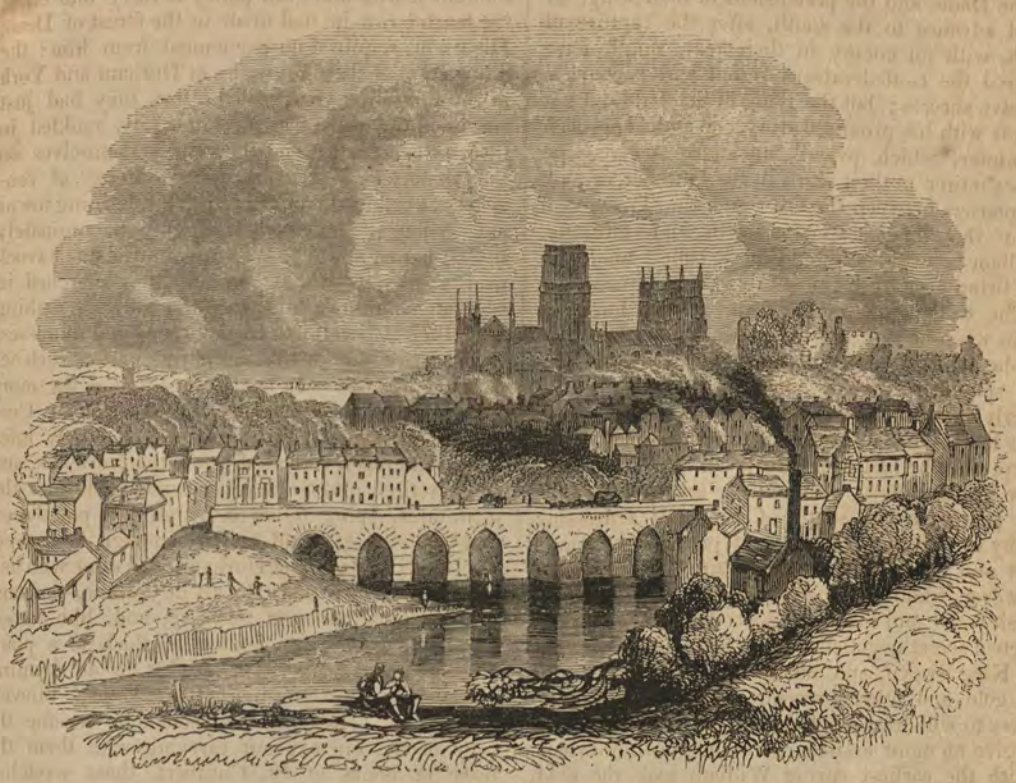
* Southey. Naval Hist.

of the Danes and the pretensions of their king. A rapid advance to the south, after the capture of York, with no enemy in their rear, might have ensured the confederates a signal and perhaps a decisive success; but the King of Scotland did not appear with his promised army, and at the approach of winter, which proved unusually severe, the Danes retired to their ships in the Humber, or took up quarters between the Ouse and the Trent, and spent that long season in sloth and gluttony. William was thus allowed time to collect his forces and bring over fresh troops from the continent.

The Conqueror was hunting in the forest of Dean when he received the first news of the catastrophe of York; and then and there he swore, by the splendour of the Almighty, that he would utterly exterminate the Northumbrian people, nor ever lay his lance in rest, when he had once taken it up, until he had done the deed. In the meantime he attempted, with infinite art, to conciliate the people in the south of England, redressing many of their grievances, and promising them a just and mild rule for the future. Not relying, however, wholly on these manœuvres, he exacted fresh oaths and hostages. At the same time he opened secret negotiations with Osbeorn, the brother of King Sweyn, and finally succeeded, by means of gold and other presents, in inducing him to agree to withdraw his Danish fleet and army, and to give no more assistance to the Northumbrians. With the earliest spring William took the field, riding at the head of the finest and most numerous cavalry that had even been seen in England, and causing his infantry to follow by forced marches. As he thus advanced the English rose nearly every where in his rear, recommencing a war on many different points at once. An inferior commander would have been confused by this multiplicity of attacks, and inevitably ruined; but William, who, considering times and circumstances, was one of the greatest generals that ever lived, did not suffer his attention to be distracted, and steadily pursued his course to the north, where he knew the great blow must be struck.

The defenders of York learned nearly at the same moment that the ruthless conqueror was approaching their walls, and that their allies, the Danes, had abandoned them, and were sailing away for the south, where, according to the treacherous compact they had made, they were to be permitted to victual and plunder the English. Abandoned as they were, and ill provided with defences,—for in their rage they had utterly destroyed the two castles,—they made an obstinate resistance; nor was York taken until many hundreds of English and Normans lay dead together. Edgar Atheling, escaping with his life, and little else, fled for a second time to the court of the Scottish king. Elated by his victory, William spent but a short time in ordering and planning fresh fortifications in York, and then continued his march northward. His rage had not moderated in the time that had elapsed, and he thought it wise and good policy to carry into effect the fearful vow he had made in the forest of Dean. His troops required no excitement from him: the destruction of their comrades at Durham and York in the preceding year, and the loss they had just sustained themselves at the latter city, rankled in their savage minds, and they threw themselves on the territory of Northumbria in a frenzy of vengeance, wasting the cultivated fields, burning towns and villages, and massacring indiscriminately flocks, herds, and men. To accomplish this havock over a great width of country, they marched in separate columns; and when the natives, rushing from their concealment in the woods and morasses, exterminated some of their scouring parties, such occasional disasters only made the survivors the more pitiless. An English army, commanded by Cospatric, disheartened, disorganised, and very inferior in numbers, retreated before the Normans, and either retired into Scotland or threw itself into the mountains, being followed by all the population that had strength and activity enough to escape. Egelwin, the Bishop of Durham—the same who had had the interview with Robert de Comine,—assembled the inhabitants of that city, and, like a good shepherd, proposed to conduct his flock to a place of safety, out of the reach of what an old rhyming chronicler calls "Normans, Burgolouns,* thieves, and felons." Leaving their homes to become the prey of the enemy, but carrying with them the body or bones of St. Cuthbert, these wretched people followed their bishop across the Tyne to Lindisfarne, or Holy Island, near the mouth of the Tweed; and the Normans a second time entered Durham, but in such force as to leave them no grounds for apprehending a repetition of the tragedy that had terminated their first visit. Having fortified Durham, which is by nature a strong position, the invaders pushed forward to the Tyne, continuing their work of devastation, and feeling their thirst for blood unslaked. A havock more complete and diabolical was never perpetrated, nor is the relation of any event of those ages sustained by more numerous and perfect proofs. The Norman and French chroniclers and historians join the English in narrating and deploring the catastrophe which, even in those times of violence and blood, seems to have overpowered men's minds with a wild horror and wonderment. William of Malmsbury, who wrote in the reign of Stephen, about eighty years after, says, "From York to Durham not an inhabited village remained. Fire, slaughter, and desolation made a vast wilderness there, which continues to this day." From Durham north to Hexham, from the Wear to the Tyne, the remorseless Conqueror continued the same infernal process. Orderic Vitalis denounces the "*feralis occisio*," the dismal slaughter; and says that more than a hundred thousand victims perished. "It was a horrid spectacle," says Roger Hoveden, "to see on the high roads and public places, and at the doors of houses, human bodies eaten by the worms,

* Burgundians.



DURHAM.

for there remained no one to cover them with a little earth." The fields in culture were burned, and the cattle and the corn in the barns carried off by the conquerors, who made a famine where they could not maintain themselves by the sword. This frightful scourge was felt in those parts in the months that followed, with a severity never before experienced in England. After eating the flesh of dead horses which the Normans left behind them, the people of Yorkshire and Northumberland, driven to the last extremity, are said to have made many a loathsome repast on human flesh.† Pestilence followed in the wake of famine; and as a completion to this picture of horror, we are informed that some of the English, to escape death by hunger, sold themselves, with their wives and children, as slaves to the Norman soldiery, who were well provided in their citadels and castles with corn and provisions, purchased on the continent with gold and goods robbed from the English.

On his return from Hexham to York, by an imperfectly known and indirect route across the fells, William was well nigh perishing. The snow was still deep in those parts, and the rivers, torrents, ravines, and mountains continually presented obstacles which the Normans had been little accustomed to in the level counties of England. The army fell into confusion, the king lost the track, and passed a whole night without knowing where he was or what direction his troops had taken. Historians are silent as to his motives for choosing this dangerous road, when a better one lay open for him; but his intention no doubt was to clear the mountains of the English fugitives, who, had they possessed proper information as to his movements, might have attacked his confused and scattered bands, and inflicted a severe punishment. Even as it was, and though no such attack is mentioned (by no means a proof that none happened), William did not reach York without a serious loss, for he left behind him most of his horses, which were said to have perished in the snow: his men also suffered the severest privations.

Confiscation now became almost general, and William openly avowed his determination to despoil and degrade the natives. All property in land, whether belonging to patriotic chiefs or to men who had taken no active part in the conflict, began to pass into the possession of the Normans and other foreigners. Nor was moveable property safer or more respected. From the beginning of the invasion the English had been accustomed to deposit their most valuable effects in the monasteries, in the hope that these sanctuaries would be respected by men who professed to be Christians, and to have a special reverence for such holy places; but now William, emboldened by success, seized the whole, under the pretext that it belonged to disloyal and

† Florent. Wigorn.

rebellious subjects. His commissioners, who in many places performed their work sword in hand, did not always draw a distinction between the plate and jewels left in deposit and the treasures that belonged to the monasteries themselves, but carried off the church ornaments and the vessels of silver or gold that were attached to the service of the altar. They also removed or destroyed all deeds and documents, charters of immunities, and evidences of property. The newly-conquered territory in the north, which must long have remained sufficiently unproductive, seeing how it had been wasted and the cultivators of the soil destroyed, was distributed in immense lots. William de Garenne had twenty-eight villages; William de Percy more than eighty manors. In Domesday Book, which was drawn up fifteen years after the Norman occupation of them, most of these domains are described as laying fallow or waste. Vast tracts of country to the north of the city of York fell to the lot of Allan the Breton, who erected a castle and other works of defence on a steep hill, nearly surrounded on all sides by the river Swale. In the language of the times, this fortress was intended to protect him and his against the redoubtable attacks of the disinherited English. Like most of the chiefs of the conquering army, he gave a French name to the place,—he called it *Richemont* or Richmount, now Richmond. Dreux Bruère, the chief of a band of Flemish auxiliaries, had the eastern part of Yorkshire, between the rivers and the sea. A story is told of this man that gives a curious idea of some of William's followers. He had married a relation of the king's, and this wife he killed in a fit of passion. Before the murder was known, he went to the king and begged him to give him money in lieu of his English estates, as he had an earnest desire to return to his own country. William granted the sum he asked, and did not learn the cause of his hasty departure until it was too late to think of stopping him. The territory of the Fleming was then conferred on Eudes of Champaign, who subsequently married a half-sister of the Conqueror. When Eudes' wife was delivered of a son, he represented to the king that his lands were not at all fertile, producing only oats, and prayed he would make him a grant of an estate proper to bear wheat, that he might have wherewith to make wheaten-bread for his infant, the king's nephew. King William presented him with some lands to his heart's wish in Lincolnshire. Gamel, the son of Quetel, who came from Meaux, in France, with a troop of his own townsmen, established himself and his companions in lands adjoining the Yorkshire possessions of Eudes of Champaign. And Basin, Sivard, Francon, and Richard d'Estouteville are mentioned as landholders and neighbours of Gamel of Meaux. The vast domain of Pontefract was the share of Gilbert de Lacy, who soon afterwards extended the Norman conquest in Lancashire and Cheshire, and obtained there estates still more extensive.* This De Lacy built Pontefract Castle, which became at a later age the scene of a fearful

Richmond, Yorkshire.

tragedy, and echoed with the dying groans of a successor and lineal descendant of the Conqueror. The desperate resistance they had made, the bands of houseless English that still roamed from place to place, made the Normans more than ever sensible of the value of deep ditches and strong stone walls. Every baron erected his castle; and in every populous town there was a strong fortress, where the Normans confined the principal natives as hostages, and into which they could retire in case of an insurrection. William did not advance farther than Hexham; but some of his captains continued the progress both to the north and to the west, though their tenure of the land was scarcely secured until some years later, when the mountainous country of Westmorland and Cumberland, and the adjacent part of Northumberland, were reduced by various chiefs. The first Earl of Cumberland was a certain Renouf Meschines, who divided the domains and handsome women of the country among his followers, thus following out the feudal system fully established by William: Simon, the son of Thorn, the English proprietor of two rich manors, had three daughters: one of these Meschines gave to Humphrey, his man-at-arms, the second he gave to Raoul, nicknamed *Tortes-mains*, and the third he reserved for his squire, William of St. Paul. In the north of Northumberland, Ives de Vescy took possession of the town of Alnwick, along with the grand-daughter and all the inheritance of a Saxon who had died in battle. Robert de Bruce obtained, by conquest, several manors and the dues of Hartlepool, the seaport of Durham. Robert D'Omfreville had the forest of Riddesdale, which belonged to Mildred the Saxon, the son of Akman. On his receiving investiture of this domain, William gave to D'Omfreville the sword he had himself worn at his entrance into Northumberland, and D'Omfreville swore upon that sword that he would make good use of it to clear the land of wolves and the enemies of the Conqueror. The nominal government of Northumberland was, however, intrusted to a native who had recently borne arms against William. This was Cospatric who came in with Waltheof, the brave son of Siward, with Morcar and Edwin, the brothers-in-law of King Harold, and submitted to William for the second time, being probably induced thereto by liberal promises from the Conqueror, who then considered them as the main prop of the English cause, wanting whom Edgar Atheling would at once fall into insignificance. The reward of Cospatric we have mentioned: Waltheof was made Earl of Huntingdon and Northampton, and received the hand of Judith, one of King William's nieces, and Morcar and Edwin were restored to their paternal estates. In reality, however, these four men were little better than prisoners, and three of them perished miserably in a very short time.

The insurrections which broke out in William's rear during his march to York were partially suppressed by his lieutenants, who suffered some reverses, and perpetrated great cruelties in return. The garrison of Exeter, besieged by the people of Cornwall, was relieved by Fitz-Osborn; Montacute repulsed the insurgents of Devonshire and Somersetshire; and Edric the Forester, who took the town of Shrewsbury with the help of the men of Chester and some Welsh, was foiled in his attempt to reduce the castle. The whole of the North-west was, however, in a very insecure state; and the haste with which William marched thither on his return to York from Hexham, seems to denote some greater peril on the side of the Normans than is expressed by any of the annalists. The weather was still inclement, and his troops were fatigued by their recent exertions, their rapid marches and counter-marches in Northumberland, yet he led them amidst storms of sleet and hail across the mountains which divide our island lengthwise, and which have been called, not inappropriately, the Apennines of England. The roads he took as being those which led direct to Chester, were scarcely passable for cavalry, and his troops were annoyed and disheartened by actual difficulties and prospective hardships and dangers. The country lying on the western sea, on the Mersey and the Dee, was painted in appalling colours; but the soldiers scarcely exaggerated the difficult and mountainous nature of Wales or the fierce valour of its inhabitants. The auxiliaries, particularly the men of Anjou and Brittany, began to murmur aloud, and not a few of the Normans, complaining of the hard service to which their chief was exposing them, talked of returning beyond sea. This discontent was overcome partly by promises of reward when the campaign should end, and partly by an affected indifference. "I can do very well without them," said William, referring to the foreign mercenaries; "they may go if they please. I have plenty to follow me. I do not want their services."* And then, on the rough way over the wealds, he partook in the fatigues of the common soldiers, marching on foot with them, and faring as they fared. Chester, which still retained the outer features of a Roman city, and where the Conqueror gazed on Roman walls and gates, then comparatively entire, had not yet been invaded by the Normans. No defence, however, was attempted there; and, after entering in triumph, William proceeded to lay the foundations of a new and strong castle, while detachments of his army reduced the surrounding country. During the Conqueror's stay, Edric the Forester submitted, and was received into favour. From Chester William marched to Salisbury, where he distributed rewards among the mercenaries, a part of whom he disbanded; and from Salisbury he repaired to his strong citadel or palace at Winchester, which city became a favourite abode with him, as it had been with his Saxon predecessors. To retain the newly-conquered province in the north-west, he had left a strong body of troops behind him, under the command of a Fleming named Gherbaud, who became the first Count or Earl of Chester. This Gherbaud

* Orderic.

was soon wearied by the constant fatigues and dangers of his post, for the English rose whenever they found an opportunity; and the mountaineers from North Wales harassed him incessantly, so that he was glad to resign his command, fiefs, and honours, and return to his own country. The Conqueror then granted the earldom of Chester to Hugh d'Avranches, a more warlike and much fiercer commander, who earned, even in that age, the surname of "The Wolf." Not satisfied with defensive operations, the new Earl immediately crossed the Dee, invaded North Wales, made himself master of a part of Flintshire, and built a castle at Rhuddlan, thus taking an important step towards the subjugation of the Welsh, a project the Normans never abandoned until it was completed, two centuries later, by Edward I. Hugh the Wolf and his ferocious followers, roused to even more than their usual ferocity by the obstinate and fierce resistance they encountered, shed the blood of the Welsh like water, and burnt and wasted their houses and lands. The fearful tragedy of Northumberland and Yorkshire was repeated on a smaller scale in this corner of the island, and famine and pestilence stalked along the banks of the Clwyd, the Dee, and the Mersey as they had done by the rivers of the north-eastern coast.

The conquered territory was apportioned as in the north. A few incidental accounts of these measures, that are found in the chroniclers, taken as they occur, may convey a better notion of the Norman system of settlement than any formal discussion of it. Almost as soon as Hugh the Wolf was installed Earl of Chester, he invited over from Normandy one Lenoir or Nigel, a friend of his early days, whom he was anxious to make the partaker of his good fortune in England. Nigel not only came over himself but brought his five brothers, Houdard, Edward, Volmar, Horsuin, and Volfan with him, having concluded, no doubt, from good reports, that there was plenty of room and promotion for them all. The Earl of Chester gave Nigel the burgh and domains of Hulton on the Mersey, and made him his constable and hereditary marshal, with great privileges, and almost unlimited means of raising money by fines, for he had the right of administering justice himself, with power of life and death, within his district of Hulton. Of the booty taken, or to be taken, from the Welsh, all the four-footed beasts were declared to be the share of Nigel, who had moreover the right of pre-emption in the city of Chester, by which he or his servants could insist on being served first of whatever they wanted to buy, provided only the servants of the Earl had not presented themselves as purchasers sooner than they. All stray cattle and animals found within the limits of Hulton were his, and Nigel enjoyed the privilege of freely selling at fairs or otherwise, without tax or duty, every species of merchandize except *salt* and *horses*. These possessions, rights, and immunities were declared hereditary in Nigel's family on the usual condition of feudal service and fealty to the immediate superior, the Earl of Chester. In the due gradation of this feudal system, Houdard, the eldest of his five brothers, was placed nearly in the same political relation to Nigel that Nigel occupied with regard to the Earl of Chester: he was hereditary Seneschal of Hulton. Nigel, his lord, gave him, *pro hommagio et servitio suo* (for his homage and service), the lands of Weston and Ashton. His profits of war were to be all the bulls taken in Wales and the best ox, as a recompense for his standard-bearer. Edward, the second brother, received from Nigel the constable a tract of land near Weston; Horsuin and Volmar got between them the domain and village of Runcone; and the fifth brother, being a priest, obtained the church of Runcone. In this manner were lands and powers lavished on hungry adventurers, who continued a slow and lasting tyranny under the names of Earls, Constables, and Seneschals.*

The disturbances on the eastern coast, which had been overlooked, now grew to such importance as to demand attention. Hereward, "England's darling," as he was called by his admiring countrymen, was lord of Born, in Lincolnshire, and one of the most resolute chiefs the Normans ever had to encounter. Having expelled the foreigners who had taken possession of his patrimony, he assisted his neighbours in doing the like, and then established a fortified camp in the Isle of Ely, where he raised the banner of independence, and bade defiance to the Conqueror. His power or influence soon extended along the eastern sea-line, over the fen country of Lincolnshire, Huntingdon, and Cambridge; and English refugees of all classes, thanes dispossessed of their lands, bishops deprived of their mitres, abbots driven from their monasteries, to make room for foreigners, repaired from time to time to his "camp of refuge." The jealous fears of the king increased the danger they were intended to lessen. Though Edwin and Morcar remained perfectly quiet, and showed every disposition to keep their oaths of allegiance, he dreaded them on account of their great popularity with their countrymen, and he finally resolved to seize their persons. The two earls received timely notice of this intention, and secreted themselves. When he thought the vigilance of the Normans was lulled, Edwin endeavoured to escape to the Scottish border, but he was betrayed by three of his attendants, and fell on the road gallantly fighting against his Norman pursuers, who cut off his head, and sent it as an acceptable present to the Conqueror.† Morcar effected his escape to the morasses of Cambridgeshire, and joined Hereward, whose camp was further crowded about this time by many of the English chiefs of the north, who had been driven homeless into Scotland. Among the ecclesiastics of Northumbria who took this course was Egelwin, the Bishop of Durham. Even Stigand, the Primate of all England, but now degraded by King and Pope, and replaced by Lanfranc, an

* Thierry.
† Orderic. Vital.—Ingulf.—H. Hunt.

Italian, is mentioned among the refugees of Ely; but his presence there seems to rest on doubtful authority.

William at length moved with a formidable army. The difficulties of this war on the eastern coast were different from, but not inferior to, what the Normans had encountered in the west and the north. There were no mountains and defiles, but the country was in good part a swamp on which no cavalry could tread; it was cut in all directions by rivers, and streams, and broad meres; and the few roads that led through this dangerous labyrinth were little known to the foreigners, and likely to be well defended by the natives, who would fight with many local advantages in their favour. The country, too, where the banner of independence floated was a sort of holy land to the English: the abbeys of Ely, Peterborough, Thorney, and Croyland, the most ancient, the most revered of their establishments, stood within it; and the monks, however professionally timid or peaceful, were disposed to resistance, for they well knew that the coming of the Normans would be the signal for driving them from their monasteries. The monks of Croyland, indeed, had already to deplore and resent many wrongs sustained from the invaders. They possessed a house at Spalding, where a part of the brotherhood had resided, and their next neighbour was a fierce baron, named Taille-bois, from Anjou, who had done them all kinds of mischief,—laming their horses and their oxen, killing their sheep and poultry, robbing their farmers, and assaulting their servants on the highway with swords and staves. After vain attempts to mollify this tyrant with entreaties and presents, the unlucky monks had taken up their beds, and their books, and the sacred utensils, and leaving their habitation at Spalding to the protection of Heaven, and shaking the dust off their feet against that "son of the fire eternal," had returned in no complacent humour to Croyland.* Taille-bois sent immediately over to Angers for some monks of his own country, whom he put in possession of the house and church at Spalding.

The Normans, surprised among the bogs and the tall rushes that covered them, suffered some severe checks. The sagacious eye of William soon saw that the proper way of proceeding would be by a blockade that should prevent provisions and succour from reaching the Isle of Ely. He accordingly stationed all the ships he could collect in the Wash, with orders to watch every inlet from the sea to the fens; and he so stationed his army as to block up every road that led into the fens by land. When he resumed more active operations he undertook a

* Ingulf.

CROYLAND BRIDGE, with the Saxon sculpture of ST. ETHELRED.

work of great note and difficulty. In order to approach the fortified camp in the midst of marshes, and an expanse of water in some places shallow, in others deep, he began to build a wooden causeway, two miles long, with bridges over the beds of the rivers. Hereward frequently interrupted these operations, and in a manner so murderous, sudden, and mysterious, that the affrighted workmen and soldiers became firmly convinced that he was leagued with the devil, and aided by some necromancer. William, whose philosophy in these matters was not in advance of his age, and who had brought over with him from Normandy a conjuror and soothsayer as an essential part of his army of invasion, was readily induced by Ives Taille-Bois, the persecutor of the monks at Spalding, to employ a sorceress on the side of the Normans, in order to neutralise or defeat the spells of the English. This sorceress was placed with much ceremony on the top of a wooden tower at the head of the works; but Hereward, the "cunning captain," watching his opportunity, set fire to the dry reeds and rushes,—the flames were rapidly spread by the wind, and tower and sorceress, workmen and soldiers, were consumed.

When the Isle of Ely had been blockaded three months provisions became scarce there. Those whose profession and vowed duties included frequent fasting were the first to become impatient under privation. The monks of Ely sent to the enemy's camp offering to show a safe passage across the fens if the king would only promise to leave them in undisturbed possession of their houses and lands. The king agreed to the condition, and two of his barons pledged their faith for the execution of the treaty. Under proper guides the Normans then found their way into the Isle of Ely, and took possession of the strong monastery which formed part of Hereward's line of defence. They killed a thousand Englishmen that either occupied an advanced position or had made a sortie; and then closing round the "camp of refuge," they finally obliged the rest to lay down their arms. Some of these brave men were liberated on paying heavy fines or ransoms; some were put to death; some deprived of their sight; some maimed and rendered unfit for war by having a right hand or a foot cut off; some were condemned to perpetual imprisonment; and in this last category were earl Morcar and the bishop of Durham. Hereward, the soul of the confederacy, would not submit, but making an effort which appeared desperate to all, he rushed from the beleaguered camp, and escaped by throwing himself into the marshes where the Normans would not venture to follow him. Passing from fen to fen, he gained the low, swampy lands in Lincolnshire, near his own estate, where he was joined by some friends, and renewed a partisan or guerilla warfare, which cost the Normans many lives, but which could not, under existing circumstances, produce any great political result. At last, seeing the hopelessness of the struggle, he listened to terms from William, who was anxious to pacify an enemy his armies could never reach, and who probably admired, as a soldier, his wonderful courage and address. Hereward made his peace, took the oath of allegiance, and was permitted by the Conqueror to preserve and enjoy the estates of his ancestors. The exploits of the last hero of Anglo-Saxon independence formed a favourite theme of tradition and poetry; and long after his death the inhabitants of the Isle of Ely showed with pride the ruins of a wooden tower which they called the castle of Hereward.

After the destruction of the camp of refuge in Ely, the Norman forces, naval as well as military, proceeded to the north to disperse some bands which had again raised the standard of independence, and invoked the presence of Edgar Atheling, who was enjoying the tranquillity and obscurity for which he was fitted, in Scotland. After some bloody skirmishes the confederates were driven beyond the Tweed; and then William crossed that river to seize the English emigrants, and punish Malcolm Caenmore. A Scottish army, which had been so anxiously expected by the English insurgents at York two years before, when its weight in the scale might have proved fatal to the Normans, had tardily marched at a moment when the Northumbrians and people of Yorkshire were almost exterminated, and when it could do little more than excite the few remaining inhabitants to a hopeless rising, and burn the houses of such as refused to join in it. The want of provisions in a land laid waste soon made the Scots recross the border. To avenge this mere predatory inroad, however, William now advanced from the Tweed to the Frith of Forth, as if he intended to subdue the whole of the "land of the mountain and flood," taking with him the entire mass of his splendid cavalry, and nearly every Norman foot-soldier he could prudently detach from garrison duty in England. Some native English, on whose fidelity to himself or dislike of the Scots he could rely, also followed him by land, while others acted as sailors on board his ships, which sailed close in-shore, and co-operated with him as he marched through the Lothians. The emigrants escaped his pursuit; nor would Malcolm deliver them up; but, intimidated by the advance of an army infinitely more numerous and better armed than his own, the Scottish king, says the Saxon chronicle, "came and agreed with King William, and delivered hostages, and was his man, and the king went home with all his force."

On his return from Scotland, William was received at Durham by the new bishop, Vaulcher or Walcher, a Lorrainer by nation, who felt so insecure in his diocese that he entreated the king to stay and build a castle for him. William, who had other business to transact, remained some time, and erected a sort of citadel on the top of the highest hill, in which the prelate might live without fear of attack. During his stay at Durham the king summoned Cospatric to appear before him, and, on the idle ground of old grievances, which had been

pardoned when that nobleman surrendered with Edwin and Morcar, he deprived him of the earldom of Northumberland, for which it appears he had paid a large sum of money. Cospatric fearing worse consequences, abandoning whatever else he had in England, fled to Malcolm Caenmore, who gave him a castle and lands. The earldom of Northumberland was conferred on Waltheof, an Englishman like himself, but now the nephew of the Conqueror by marriage with his neice Judith.

The Normans had now been seven years in the land, engaged in almost constant hostilities; and at length England, with the exception of Wales, might fairly be said to be conquered. In most abridgments and epitomes of history the events we have related in not unnecessary detail, are so faintly indicated, and huddled together in so narrow a space, as to leave an impression that the resistance of our ancestors after the battle of Hastings was trifling and brief,—that the sanguinary drama of the Conquest was almost wholly included in one act. Nothing can be more incorrect than this impression, or more unfair to that hardy race of men who were the fountain-source of at least nine-tenths of the blood that flows in the large and generous vein of the English nation. "The successive contests in which the Conqueror was engaged," says a recent historian, with becoming warmth, "ought not to be regarded as, on his part, measures to quell rebellion. They were a series of wars, levied by a foreign prince against unconquered and unbending portions of the Saxon people. Their resistance was not a flame casually lighted up by the oppression of rulers,—it was the defensive warfare of a nation who took up arms to preserve, not to recover, their independence. There are few examples of a people who have suffered more for national dignity and legitimate freedom. The Britons are, perhaps, too far from us to admit our fellow-feeling with them. When we stretch out our hands towards their heroes, we scarcely embrace more than a shadow. But let us not distort history by throwing the unmerited reproach of want of national spirit on the Anglo-Saxon, and thus placing an impassable barrier between our sympathy and the founders of our laws and liberties, whose language we speak, in whose homes we dwell, and in whose establishments and institutions we justly glory."*

Not long after his return from Scotland, circumstances imperatively called for the presence of William in his continental dominions. His talents as a statesman and warrior are indisputable, yet few men have owed more to good fortune. Their wrongs and provocations were the same then as now, and policy would have suggested to the people of Maine to exert themselves a year or two before, when William, engaged in difficult wars in England, would have been embarrassed by their insurrection on the continent. But they made their great effort just as England was reduced to the quietude of despair, and when William could proceed against them unincumbered by any other war.

* Sir J. Mackintosh.

Herbert, the last count or national chief, bequeathed the county of Maine, bordering on Normandy, to Duke William, who, to the displeasure of the people, but without any important opposition, took possession of it several years before he invaded England. Instigated by Fulk, Count of Anjou, and vexed by a tyrannical administration, the people of Maine now rose against William, and expelled the magistrates he had placed over them, and drove out from their towns the officers and garrisons of the Norman race. Deeming it imprudent to remove his Norman forces from this island, he collected a considerable army among the English population, and carrying them over to Normandy, he joined them to some troops levied there, and putting himself at their head, marched into the unfortunate province of Maine. The national valour which so often opposed him was now exerted with a blind fury in his favour. The English beat the men of Maine, burnt their towns and villages, and did as much mischief as the Normans (among whom was a strong contingent from Maine) had perpetrated in England.

While these things were passing on the continent Edgar Atheling received an advantageous offer of services and co-operation from Philip, king of France, who at last, and too late, roused himself from the strange sloth and indifference with which he had seen the progress made by his overgrown vassal the Duke of Normandy. The events in Maine, the dread inspired in all the neighbouring country, even to the walls of Paris, and William's exhibition of force, were probably the immediate causes that dispelled Philip's long sleep. He invited Edgar, with whose unpromising character he was probably unacquainted, to come to France and be present at his council, promising him a strong fortress situated on the Channel at a point equally convenient for making descents upon England or incursions or forays into Normandy. Closing with the proposals, Edgar got ready a few ships and a small band of soldiers, being aided therein by his sister, the queen of Scotland, and some of the Scottish nobility, and made sail for France. His usual bad luck attended him: he had scarcely gained the open sea when a storm arose, and drove his ships ashore on the coast of Northumberland, where some of his followers were drowned and others taken prisoners by the Normans. He and a few of his friends of superior rank escaped and got into Scotland, where they arrived in miserable plight, with nothing but the clothes on their backs, some walking on foot, some mounted on sorry beasts. After this misfortune, his brother-in-law, King Malcolm, advised him to seek a reconciliation with William, and Edgar accordingly sent a messenger to the Conqueror, who at once invited him to Normandy, where he promised proper and honourable treatment. Instead of sailing direct from Scotland, the Atheling, whose feelings were as obtuse as his intellect, took his way through England, the desolated kingdom of his ancestors, feasting at the castles of the Nor-

man invaders as he went along. Insignificant as he was, the English people still loved his name; it was therefore deemed expedient to secure his person, and this was done under a decent semblance by the sheriff of Yorkshire, who met him with a numerous escort at Durham, and accompanied him until he embarked. William received him with a show of kindness, and allotted him an apartment in the palace of Rouen, with a pound of silver a-day for his maintenance; and there the descendant of the great Alfred passed eleven years of his life, occupying himself with dogs and horses.

The king, who had gone to the continent to quell one insurrection, was recalled to England by another of a much more threatening nature, planned, not by the English, but by the Norman barons, their conquerors and despoilers, who were either dissatisfied with the rewards they had received, or disgusted by the imperious character, the overbearing, and intermeddling of the king. William Fitz-Osborn, the prime favourite and counsellor of the Conqueror, had died a violent death in Flanders, and had been succeeded in his English domains and the earldom of Hereford by his son Roger Fitz-Osborn. This young nobleman negociated a marriage with Raoul or Ralph de Gaël, a Breton by birth, and Earl of Norfolk in England by the right of the sword. For some reason not explained, this alliance was displeasing to the king, who sent from Normandy to prohibit it. The parties were enraged at this prohibition, which, however, they determined not to obey, and on the day which had been previously fixed for the ceremony Emma, the affianced, was conducted to Norwich, where a wedding-feast was celebrated that was fatal to all who were present at it.* Among the guests who had been invited, rather for the after-act than to do honour to the bride and bridegroom, were Waltheof, the husband of Judith, sundry barons and bishops of the Norman race, some Saxons who were friends to the Normans, and even some chieftains from the mountains of Wales, with whom their neighbour, the Earl of Hereford, the brother of the bride, had thought proper to cultivate amicable relations. A sumptuous feast was followed by copious libations; and when the heads of the guests were heated by wine, the Earls of Hereford and Norwich, who were already committed by carrying the forbidden marriage into effect, and who knew the implacable temper of William, opened their plans with a wild and energetic eloquence. They inveighed against the arbitrary conduct of the king,—his harsh and arrogant behaviour to his noblest barons,—and his apparent intention of reducing the Normans to the same condition of misery and servitude as the English, whose wrongs and misfortunes they affected to commiserate. Hereford complained of his conduct with regard to the marriage, saying it was an insult offered to the memory of his father, Fitz-Osborn, the man to whom the Bastard incontestably owed his crown. By degrees the excited

* Chron. Sax.

Norwich Castle.

assembly broke forth in one general curse against the Conqueror. The old reproach of his birth was revived over and over again. "He is a bastard, a man of base extraction," cried the Normans; "it is in vain he calls himself a king; it is easy to see he was never made to be one, and that God hath him not in his grace."—"He poisoned our Conan, that brave Count of Brittany," said the Bretons. "He has invaded our noble kingdom, and massacred the legitimate heirs to it, or driven them into exile," cried the English. "He is ungrateful to the brave men who have shed their blood for him, and raised him to a higher pitch of greatness than any of his predecessors ever knew," said the foreign captains; "and what has he given to us conquerors covered with wounds? Nothing but lands naturally steril or devastated by the war; and then, as soon as he sees we have improved those estates, he takes them from us, or diminishes their extent." The guests cried out tumultuously that all this was true,—that William the Bastard was in odium with all men,—that his death would gladden the hearts of many.*

The great object of the Norman conspirators was to gain over Earl Waltheof, whose warlike qualities and great popularity with the English were well known to them; and, when they proceeded to divulge the particulars of their plan, the Earls of Hereford and Norwich allured him with the promise of a third of England, which was to be partitioned into the old Saxon kingdoms of Wessex, Mercia, and Northumberland. With the fumes of wine in his head, and a general ardour and enthusiasm around him, Waltheof, it is said, gave his approval to the conspiracy, which he thought held out a prospect of relief to his own countrymen; but, according to one version of the story, the next morning, "when he had consulted with his pillow, and awaked his wits to perceive the danger whereunto he was drawn, he determined not to move in it," and took measures to prevent its breaking out. A more generally-received account, however, is, that Waltheof, seeing from the first the madness of the scheme, and the little probability it offered of benefiting the English people, refused to engage in it, and only took an oath of secrecy. The whole project, indeed, was insane; the discontented barons had scarcely a chance of succeeding against the established authority and the genius of William; and their success, had it been possible, would have proved a curse to the country,—a step fatally retrograde,—a going back towards the time of the Saxon Heptarchy, when England was fractured into a number of petty, hostile states. It is quite certain that Waltheof never took up arms, nor did any overt act that could be construed into treason; but in his uneasiness of mind, and his confidence in so dear a connexion, he disclosed to his wife Judith all that had been done in Norwich Castle; and this confidence is generally believed to have been one of the main causes of his ruin. Roger Fitz-Osborn and Ralph de Gaël, the real heads of the confederacy, were hurried into action before their scheme was ripe, for their secret was betrayed by some one. The first of these earls, who had returned to his government, and collected his followers and a considerable number of Welsh, was checked in his attempt to cross the Severn at Worcester; nor could he find a passage at any other point, as Ours, the Viscount of Worcester, and Wulfstan, the bishop, occupied the left bank of that river with a great force of Norman cavalry. Egelwin, the abbot of Evesham, who, like Wulfstan, was an Englishman, induced the population of Gloucester to rise and co-operate with the king's officers; and Walter de Lacy, a great baron in those parts, soon brought up a mixed host of English and Normans, that rendered the Earl of Hereford's project of crossing the Severn, to co-operate with his brother-in-law in the heart of England, altogether hopeless. Lanfranc, the Italian Archbishop of Canterbury, who acted as viceroy during William's absence, proceeding with the greatest decision, also sent troops from London and Winchester to oppose Fitz-Osborn, at whose head he hurled, at the same time, the terrible sentence of excommunication. In writing to the king in Normandy, the Primate said, "It would be with pleasure, and as envoy of God, that we would welcome you among us; but," added the energetic old priest, "do not hurry yourself to cross the sea, for it would be putting us to shame to come and aid us in destroying such traitors and thieves." The Earl of Hereford fell back from the Severn; and his brother-in-law, the Earl of Norfolk, left to himself, and unable to procure in time assistance for which he had applied to the Danes, was suddenly attacked by a royal army of very superior force, led on by Odo, the bishop of Bayeux, Geoffrey, bishop of Coutance, and Richard de Bienfait and William de Warenne, the two justiciaries of the kingdom, who obtained a complete victory, and cut off the right foot of every prisoner they made. The earl retreated to Norwich, garrisoned his castle with the most trusty of his followers, and, leaving his bride to defend it, passed over to Brittany, in hopes of obtaining succour from his countrymen. The daughter of William Fitz-Osborn defended Norwich Castle with great bravery; and when, at the end of three months, she capitulated, she obtained mild terms for her garrison, which was almost entirely composed of Bretons. They did not suffer in life or limb, but were shipped off to the continent within the term of forty days. The Bretons generally had rendered themselves unpopular at William's court. With the true character of their race, they were irascible, turbulent, factious, and much more devoted to the head of their clan than to the king. When they were embarked, Lanfranc wrote to his master, "Glory be to God, your kingdom is at last purged of the filth of these Bretons." The king invaded Brittany in the hope of exterminating the fugitive Earl of Norwich in his native castle, and reducing that province to entire subjection; but, after laying

* Will. Malm.—Matt. Paris.—Orderic.

an unsuccessful siege to the town of Dol, he was obliged to retire before an army of Bretons, who were supported by the French king.* William then crossed the Channel to suppress the insurrection in England; but by the time he arrived there was little left for him to do except to punish the principal offenders. The Earl of Hereford had been followed, defeated, and taken prisoner; and many of his adherents, Welsh, English, and Normans, hanged on high gibbets, or blinded or mutilated. At a royal court, De Gaël was outlawed, and his brother-in-law, Fitz-Osborn, condemned to perpetual imprisonment and the forfeiture of his property. Scarcely one of the guests at the ill-augured marriage of Emma Fitz-Osborn escaped with life; and even the inhabitants of the town of Norwich felt the weight of royal vengeance. The last and most conspicuous victim was Waltheof, who had been guilty at most of a misprision of treason. His secret had been betrayed by his wife Judith, who is said, moreover, to have accused him of inviting over the Danish fleet, which now made its appearance on the coast of Norfolk. The motive that made this heartless woman seek the death of her brave and generous husband was a passion she had conceived for a Norman nobleman, whom she hoped to marry if she could but be made a widow. Others, however, although acting under different impulses, were quite as urgent as the Conqueror's niece for the execution of the English earl. These were Norman barons who had cast the eyes of affection on his honours and estates,—"his great possessions being his greatest enemies." The judges were divided in opinion as to the proper sentence; some of them maintaining that, as a revolted *English* subject, Waltheof ought to die; others, that as an officer of the king, and according to *Norman* law, he ought only to suffer the minor punishment of perpetual imprisonment. These differences of opinion lasted nearly a whole year, during which the earl was confined in the royal citadel of Winchester. At length his wife and other enemies prevailed; the sentence of death was pronounced, and confirmed by the king, who is said to have long wished for the opportunity of putting him out of his way. The unfortunate son of that great and good earl, Siward, whom Shakspeare has immortalised, was executed on a hill, a short distance from the town of Winchester, at a very early hour in the morning, and in great haste, lest the citizens should become aware of his fate, and attempt a rescue.† His body was thrown into a hole dug at a cross-road, and covered with earth in a hurry; but the king was induced to permit its removal thence, and the English monks of Croyland, to whom the deceased earl had been a benefactor, took it up and carried it to their abbey, where they gave it a more honourable sepulture. The patriotic superstition of the nation soon converted the dead warrior into a saint, and the universal grief of the English people found some consolation in giving a ready credence to the miracles said to be performed at his tomb. The Anglo-Saxon hagiology seems to have abounded beyond that of most other nations in unfortunate patriots and heroes who had fallen in battle against the invaders of the country. We may excuse the superstition for the sake of the patriotism; but it was of course far otherwise with the Conqueror, who took harsh measures against the English abbot of Croyland for publishing the miraculous facts, and preaching about them to those who visited his house to weep and pray over Waltheof's grave. A council of Norman bishops and barons assembled at London accused the abbot of idolatry, degraded him from his dignity, and sent him as a simple monk or recluse, to be shut up in Glastonbury abbey, which was far away from Croyland, and governed by Toustain, a Norman, noted as being "cruentissimus abbas" (a most cruel abbot). But, in spite of the decisions of the Norman council, the ecclesiastical chief of Croyland was still a true man in the eyes of the English, and Earl Waltheof remained a saint in their estimation. Even when forty years had passed, and the government of the abbey, which had been held by a succession of foreigners, fell to a certain Geoffrey, a native of Orleans, the miracles began again at the tomb of the English chief, and the people flocked thither in great numbers, heedless of the mockery and insults of the Norman monks of Croyland, who maintained that Waltheof was a felon and a traitor, who had justly merited his fate.* And what became of the widow of the brave son of Siward,—of the "infamous Judith," as she is called by nearly all the chroniclers? So far from permitting her to marry the man of whom she was enamoured, her uncle William, who was most despotic in these matters, and claimed as part of his prerogative the right of disposing of female wards, insisted on her giving her hand to one Simon, a Frenchman of Senlis, a very brave soldier, but lame and deformed; and when the perverse widow rejected the match with insulting language, he drove her from his presence, deprived her of all Waltheof's estates, and gave them to Simon without the incumbrance of such a wife. Cast from the king's favour, and reduced to poverty, she became almost as unpopular with the Normans as she was with the English; and the wretched woman, hated by all, or justly contemned, passed the rest of her life in wandering in different corners of England, seeking to hide her shame in remote and secluded places.†

The Normans had been gradually encroaching on the Welsh territory, both on the side of the Dee and on the side of the Severn, and now William in person led a formidable army into Wales, where he is said to have struck such terror that the native princes performed feudal homage to him at St. David's, and delivered many hostages and Norman and English prisoners, with which he returned as

"a victorious conqueror." In the north of England he made no farther progress, and had considerable difficulty in retaining the land he had occupied. The Scots again crossed the Tweed and the Tyne, and much harassed the Norman barons. At the approach of a superior army they retired; but William's officers did not follow them, and the only result of the expedition, on the king's side, was the founding of the city of Newcastle-upon-Tyne. The impression made upon Scotland by the Conqueror, when he had marched in person, must have been of the slightest kind, and his circumstances never permitted him to return.

A.D. 1077-9. He was now wounded by the sharp tooth of filial disobedience, and obliged to be frequently, and for long intervals, on the continent, where a fierce and unnatural war was waged between father and son. When William first received the submission of the province of Maine (the subsequent and unfortunate insurrection of which we have mentioned), he had promised the inhabitants to make his eldest son, Robert, their prince; and before departing for the conquest of England he stipulated, that in case of succeeding in his enterprise, he would resign the duchy of Normandy to the same son. So confident was he of success, that he permitted the Norman chiefs who consented to, and legalised the appointment, to swear fealty and render homage to young Robert as their future sovereign. But all this was done to allay the jealousy of the king of France and his other neighbours, uneasy at the prospect of his vastly extending power; and when he was firmly seated in his conquest, and had strengthened his hands, William openly showed his determination of keeping and ruling both his insular kingdom and his continental duchy. Grown up to man's estate, Robert claimed what he considered his right. "My son, I wot not to throw off my clothes till I go to bed," was the homely but decisive answer of his father. Robert was brave to rashness, ambitious, impatient of command; and a young prince in his circumstances was never yet without adherents and counsellors to urge him to those extreme measures on which they found their own hopes of fortune and advancement. He was suspected of fanning the flames of discontent in Brittany as well as in Maine, and to have had an understanding with the king of France, when that monarch frustrated William's attempt to seize the fugitive Breton Raoul de Gaël, and forced the king of England to raise the siege of Dol. Some circumstances which added to the number of the unnatural elements already engaged made Robert declare himself more openly. In person he was less favoured by nature than his two younger brothers William and Henry, who seemed to engross all their father's favour, and who probably made an improper use of the nickname of *Courte-heuse*,* which was given to Robert, on account of the shortness of his legs. One day, when the king and his court were staying in the little town of L'Aigle, William and Henry went to the house of a certain Roger Chaussiègue, which had been allotted to their brother Robert for his lodging, and installed themselves, without his leave, in the upper gallery or balcony. After playing for a time at dice, "as was the fashion with military

DICE PLAYING. From an Engraving in Strutt's Sports.

men,"* they began to make a great noise and uproar, and then they finished their boyish pranks by emptying a pitcher of water on the heads of Robert and his comrades, who were passing in the court below. Robert, naturally passionate, probably required no additional incentive; but it is stated, that one of his companions, Alberic de Grantmesnil, a son of Hugh de Grantmesnil, whom King William had formerly deprived of his estates in England, instigated the prince to resent the action of his brothers as a public affront, which could not be borne in honour. Robert drew his sword and ran up stairs, vowing he would wipe out the insult with blood. A great tumult followed, and the king, who rushed to the spot, had much difficulty in quelling it. That very night Robert fled with his companions to Rouen, fully determined to raise the standard of revolt. He failed in his first attempt, which was to take the castle of Rouen; and soon after, some of his warmest partisans were surprised and made prisoners by the king's officers. The prince escaped across the frontiers of Normandy into the district of Le Perche, where Hugh, nephew of Aubert le Ribaud, welcomed him, and sheltered him in his castles of Sorel and Reymalard. By the mediation of his mother, who seems to have been fondly attached to him, Robert was reconciled to his father; but the reconciliation did not last long, for the prince was as impatient for authority as ever; and the young counsellors who surrounded him found it unseemly and altogether abominable that he should be left so poor, through the avarice of his father, as not to have a shilling to give his faithful friends who followed his fortunes.† Thus excited, Robert went to his father, and again demanded possession of Normandy; but the king again refused him, exhorting him at the

* "Ibique super solarium (sicut militibus mos est) tesseris ludere cœpernut."—Ibid.
† Orderic.

same time to change his associates for serious old men like the royal counsellor and prime minister, Archbishop Lanfranc. "Sire," said Robert, bluntly, "I came here to claim my right, and not to listen to sermons—I heard plenty of them, and tedious ones too, when I was learning my grammar;" and then he added, that he insisted on a positive answer to his demand of the duchy. The king wrathfully replied that he would never give up Normandy, his native land, nor share with another any part of England, which he had won with his own toil and peril "Well, then," said Robert, "I will go and bear arms among strangers, and perhaps I shall obtain from them what is refused to me by my father."* He set out accordingly, and wandered through Flanders, Lorraine, Gascony, and other lands, visiting dukes, counts, and rich burgesses, relating his grievances, and asking assistance; but all the money he got on these eleemosynary circuits he dissipated among minstrels and jugglers, parasites and prostitutes, and was thus obliged to go again a begging, or borrow money at an enormous interest. Queen Matilda, whose maternal tenderness was not estranged by the follies and vices of her son, contrived to remit him several sums when he was in great distress. William discovered this, and sternly forbade it for the future. But her heart still yearning for the prodigal, the queen made further remittances, and her secret was again betrayed. The king then reproached her in bitter terms for distributing among his enemies the treasures he gave her to guard for himself, and ordered the arrest of Samson, her messenger, who had carried the money, and whose eyes he vowed to tear out as a proper punishment. Samson, who was a Breton, took to flight, and became a monk "for the salvation both of body and soul."†

After leading a vagabond life for some time, Robert repaired to the French court; and King Philip, still finding in him the instrument he wanted, openly espoused his cause, and established him in the castle of Gerberoy, on the very confines of Normandy, where he supported himself by plundering the neighbouring country, and whence he corresponded with the disaffected in the duchy. Knights and troops of adventurers on horseback flocked to share the plunder and the *pay* he now had to offer them: in the number were as many Norman as French subjects, and not a few men of King William's own household. Burning with rage, the king crossed the Channel with a formidable English army, and came in person to direct the siege of the strong castle of Gerberoy, where he lost many men in fruitless operations, and from sorties made by the garrison. With all his faults, Robert had many good and generous qualities, which singularly endeared him to his friends when living, and which, along with his cruel misfortunes, caused him to be mourned when dead. Ambition, passion, and evil counsel had lulled and stupified, but had not extirpated his natural feelings. One day, in a sally from his castle, he chanced to engage in single combat with a stalwart warrior clad in mail, and concealed, like himself, with the visor of his helm. Both were valiant and well skilled in the use of their weapons, but, after a fierce combat, Robert wounded and unhorsed his antagonist. In the voice of the fallen warrior, who shouted for assistance, the prince, who was about to follow up his advantage with a death-stroke, recognised his father, and, instantly dismounting, fell on his knees, craved forgiveness with tears, and helping him to his saddle, saw him safely out of the *mêlée* which now thickened. The men who were coming up to the king's assistance, and bringing a second horse for him to mount, were nearly all killed. William rode away to his camp on Robert's horse, smarting with his wound, and still cursing his son who had so seasonably mounted him.* He relinquished the siege of Gerberoy in despair, and went to Rouen, where, as soon as his temper permitted, his wife and bishops, with many of the Norman nobles, laboured to reconcile him again to Robert. For a long time the iron-hearted king was deaf to their entreaties, or only irritated by them. "Why," cried he, "do you solicit me in favour of a traitor who has seduced my men,—my very pupils in war, whom I fed with my own bread, and invested with the knightly arms they wear?"† At last he yielded, and Robert, having again knelt and wept before him, received his father's pardon, and accompanied him to England. But even now the reconciliation on the part of the unforgiving king was a mere matter of policy, and Robert, finding no symptoms of returning affection, and fearing for his life or liberty, soon fled for the third time, and never saw his father's face again. His departure was followed by another paternal malediction, which was never revoked.

A.D. 1080. We have seen in the course of this, as we shall see in several succeeding reigns, that bishops were soldiers as well as priests,—as ready to wield the lance as the crosier,—and especially ambitious of temporal commands. Walcher de Lorraine, installed in the bishopric of Durham and his strong castle "on the highest hill," soon united to his episcopal functions the political and military government of Northumberland. The admirers of the earl-bishop boasted that he was equally skilful in repressing rebellion with the edge of the sword and reforming the morals of the English by eloquent discourse.‡ The plain truth, however, seems to be, that the Lorrainer was a harsh task-master to the English, laying heavy labours and taxes upon them, and permitting the officers under him and his men-at-arms to plunder, insult, and kill them with impunity.§ Liulf, an Englishman of noble birth, and endeared by his good qualities to

the whole province, ventured, on being robbed by some of Walcher's satellites, to lay his complaint before the bishop. Shortly after making this accusation, Liulf was murdered by night in his manor-house, near the city of Durham, and it was well proved that one Gilbert, and others in the bishop's service, were the perpetrators of the foul deed. "Hereupon," says an old writer, "the malice of the people was kindled against him, and when it was known that he had received the murderers into his house and favoured them as before, they stomached the matter highly." Secret meetings were held at the dead of night, and the Northumbrians, who had lost none of their old spirit, and were absolutely driven to madness, because, among other causes of endearment, Liulf had married the widow of Earl Siward, the mother of the unfortunate Earl Waltheof, resolved to take a sanguinary vengeance. Both parties met by agreement at Gateshead;* the bishop, who protested his innocence of the homicide, in the pomp of power, surrounded by his retainers; the Northumbrians, in humble guise, as if to petition their lord for justice, though every man among them carried a sharp weapon hid under his garment. The bishop, alarmed at the number of English that continued to flock to the place of rendezvous, retired with all his retinue into the church. The people then signified in plain terms that, unless he came forth and showed himself, they would fire the place where he stood. As he did not move the threat was executed. Then, seeing the smoke and flames arising, he caused Gilbert and his accomplices to be thrust out of the church. The people fell with savage joy on the murderers of Liulf, and cut them to pieces. Half suffocated by the heat and smoke, the bishop himself wrapped the skirts of his gown over his face and came to the threshold of the door. There seems to have been a moment of hesitation, but a voice was heard among the crowd, saying, "Good rede, short rede! Slay ye the bishop!" and the bishop was slain accordingly.† The foreigners had nothing left but the alternative of being burnt alive or perishing by the sword. The bishop's chaplain seemed to give a preference to the former death, for he lingered long in the burning church; but, in the end, he was compelled by the raging fire to come out, and was also slain and hacked to pieces—"as he had well deserved," adds an old historian, "being the main promoter of all the mischief that had been done in the country."‡ Of all who had accompanied the bishop to the tragical meeting at Gateshead, only two were left alive, and these were menials of English birth. Above a hundred men, Normans and Flemings, perished with Walcher.§ The conspirators attacked the castle at Durham; but finding it well defended by a numerous garrison, and altogether too strong for them, they gave up the siege the fourth day, and dispersed.

A.D. 1082. William intrusted to one bishop the office of avenging another. His half-brother, Odo, the fierce bishop of Bayeux, marched to Durham with a numerous army. He found no force on foot to resist him, but he treated the whole country as an insurgent province, and making no distinction of persons, and employing no judicial forms, he beheaded or mutilated all the men he could find in their houses. Some persons of property bought their lives by surrendering everything they possessed. By this exterminating expedition Odo obtained the reputation of being one of the greatest "dominators of the English;" but it seems to have been the last he commanded, and disgraced with cruelty, during the reign of William. This churchman, besides being bishop of Bayeux in Normandy, was Earl of Kent in England, and held many high offices in this island, where he had accumulated enormous wealth, chiefly by extortion, or a base selling of justice. For some years a splendid dream of ambition, which he thought he could realise by means of money, increased his rapacity. There were many instances in those ages of kings becoming monks, but not one of a Catholic priest becoming a king. Profane crowns being out of his reach, Odo aspired to a sacred one,—to the tiara,—that triple crown of Rome which gradually obtained, in another shape, a homage more widely extended than that paid to the Cæsars. His dream was cherished by the predictions of some Italian astrologers, who, living in his service, and being well paid, assured him that he would be the successor of Gregory VII., the reigning pope. Odo opened a correspondence with the eternal city by means of English and Norman pilgrims, who were constantly flocking thither, bought a palace at Rome, and sent rich presents to the senators. His project was not altogether so visionary as it has been considered by most writers, and we can hardly understand why his half-brother, William, should have checked it, unless indeed his interference proceeded from his desire of getting possession of the bishop's wealth. Ten years before the Conqueror invaded England, Robert Guiscard, one of twelve heroic Norman brothers, had acquired the sovereignty of the greater part of those beautiful countries that are now included within the kingdom of Naples. The Norman lance was dreaded in all the rest of Italy, and, with a Norman pope established at Rome, the supremacy of that people might have been extended from one end of the Peninsula to the other. The bishop of Bayeux had some reason for counting on the sympathy of his powerful countrymen in the south, the close neighbours of Rome; and the influence of gold had been felt before now in the college of cardinals and the elections of popes. It is quite certain that a considerable number of the Norman chiefs entered into Odo's views, and when he made up his mind to set out for Italy in person, a brilliant escort was formed for him. "Hugh the Wolf," the famous Earl of Chester, who had a long account of sin to settle if he considered the butchering of English and Welsh as crimes, was anxious to go to Rome, and joined

* The name means "Goat's Head;" "ad caput capræ."—Florent. Wigorn.
† Matt. Par. ‡ Holinshed, §§ Chron. Sax.

the bishop, with some considerable barons, his friends, and much money.

The king was in Normandy when he heard of this expedition, which had been prepared in great secrecy, and being resolute in his determination of stopping it, he instantly set sail for England. He surprised the aspirant to the popedom at the Isle of Wight, seized his treasures, and summoned him before a council of Norman barons hastily assembled at that island. Here the king accused his half-brother of "untruth and sinister dealings,"—of having abused his power both as viceroy and judge, and, as an earl of the realm, of having maltreated the English beyond measure, to the great danger of the common cause,—of having robbed the churches of the land,—and, finally, of having seduced and attempted to carry out of England, and beyond the Alps, the warriors of the king, who needed their services for the safe keeping of the kingdom. Having exposed his grievances, William asked the council what such a brother deserved at his hands? No one durst answer: "Arrest him, then!" cried the king, "and see that he be well looked to!" If they had been backward in pronouncing an opinion, they were still more averse to lay hands on a bishop: not one of the council moved, though it was the king that ordered them. William then advanced himself, and seized the prelate by his robe. "I am a clerk,—a priest," cried Odo. "I am a minister of the Lord: the pope alone has the right of judging me!" But his brother, without losing his hold, replied, "I do not arrest you as bishop of Bayeux, but as Earl of Kent." * Odo was carried forthwith to Normandy, and, instead of crossing the Alps and the Apennines, was shut up in the dungeon of a castle. Some of the worst crimes imputed to Odo had been committed at the order and for the service of his brother, but William probably found a relief in laying as much of the guilt as he could on another's shoulders; and the bishop was so universally detested by the English people, that the king became almost popular among them by the punishment he awarded.

Soon after imprisoning his brother, William lost his wife, Matilda, whom he tenderly loved; and after her death, it was observed, or fancied, he became more suspicious, more jealous of the authority of his old companions in arms, and more avaricious than ever. The coming on of old age is, however, enough in itself to account for such a change in such a man. After a lapse of ten years, the Danes were again heard of. The fleet and army which had co-operated so badly with Edgar Atheling and the Northumbrians, and so shamefully deserted them in the hour of need, when the Conqueror marched upon York, returned to Denmark a shattered and dishonoured wreck, having been assailed by tempests on their way. Sueno Estridsen disgraced and banished Osbern, the commander-in-chief of the expedition, who was his own brother, charging him with corrupt and faithless conduct. He then assembled a second fleet for the assistance of the English confederates, who maintained the struggle in the fen country with Hereward; but when these ships reached our eastern coast, those on board found that William was provided with a maritime force quite sufficient to prevent their landing or assisting the patriots. The fleet then returned to Denmark with no more success, but with less dishonour, than the one that had preceded it.

In a short space of time both Sueno and his legitimate son Harold departed this life. Canute the Dane, who was illegitimate, like William the Norman, then ascended the throne, and though he ended it as a saint he began his reign like a warrior, and laid claim to England as successor of his namesake Canute the Great. Not relying wholly on the strength of Denmark, he applied to the Norwegians for assistance, after the fashion of old times, not forgetting to remind them of the glory their forefathers had obtained in England. Olaf, or Olave, surnamed the Peaceful, was then king of Norway. A meeting between the two kings took place upon the river Gotha-Elf, near Konungahella (or Konghell), at that time the capital of the Norwegian kingdom. Olave approved of the enterprise as a just one, and promised to furnish sixty ships, but declined taking any further part in it, affirming that Norway could no longer furnish such an armament as had followed his father Hardrada to the Humber; and that he, Olave, was far from being such a general as Hardrada. Olave must have remembered the fearful catastrophe of Stamford-bridge, the generosity he experienced from Harold when a captive in his hands, and the vow he took to that unfortunate king to maintain constant faith and friendship with the English.* It is probable, however, that he would not consider a war made on the Normans in England as a breach of that vow; and that the narrow scale of his co-operation was really owing to the cause he assigned to Canute,—namely, that the strength of Norway had been exhausted by Hardrada's fatal expedition. In another quarter to which he applied Canute received more liberal promises; his father-in-law, Robert, Earl of Flanders, engaging to join him with six hundred ships. The united armament, it was calculated, would amount to a thousand sail. Olave sent his sixty ships with sufficient promptitude; but we have not discovered the state of preparation of the Earl of Flanders, who possibly had promised more than he could perform. Delays of various kinds arose; and when Canute had fixed the day for sailing, he discovered that his own brother, the governor of Sleswic, who was engaged to accompany him to England, had secretly withdrawn from the fleet to his government, intending to take advantage of his absence, and seize the Danish throne. He was apprehended, and sent in chains to Flanders, there to be kept in safe prison; but all this caused still further delay, and the traitor left many partisans in the fleet. These men, among whom it appears were some officers of high rank, reported

* Chron. Sax.—Florent.—Malmsb.—Orderic.

* See ante, p. 209.

among the mariners and soldiers that the provisions for the voyage would be found insufficient; and many left their ships from the dread of being starved at sea. There was also the discouragement of bad weather, contrary winds, and inauspicious omens; and the gold of the wealthy king of England is said to have been again employed in Denmark. Desertion at last took place to such an extent that Canute, abandoned by his own, was left with only the Norwegian fleet; and thus the last invasion from the Baltic with which England was threatened was wholly frustrated.* The intention of Canute, his alliances and preparations,—of all of which he was well informed,—kept William in a state of anxiety for nearly two whole years, and were the cause of his laying fresh burdens upon his English subjects. He revived the odious Dane-gelt; and because many lands and manors which had been charged with it in the time of the Anglo-Saxon kings had been specially exempted from this tax when he granted them in fief to his nobles, he made up the deficiency by raising it upon the other lands to the rate of six shillings a hide. The money he thus obtained, with part of the treasures he had amassed, was employed in hiring and bringing over foreign auxiliaries; for though he could rely on an English army when fighting against Frenchmen, or the people of Normandy, Maine, and Brittany, he could not trust them at home; and he well knew that many of them on the eastern and north-eastern shores would join the Danish invaders heart and hand, instead of opposing them. He therefore collected, as he had done before, men of all nations; and these came across the Channel in such numbers that, according to the chroniclers, people began to wonder how the land could feed so many hungry bellies. These hordes of foreigners sorely oppressed the natives, for William quartered them throughout the country, to be paid as well as supported. They were mostly foot-soldiers, which implies that they were men of a very low and rude condition; for at this period soldiers of fortune of any pretension served only on horseback. One of the bands which he thus engaged belonged to Hugh, a brother of the French king; but this was probably of a class superior to the rest.

To complete the miseries inflicted upon England at this time, William ordered all the land lying near the sea-coast to be laid waste, so that, if the Danes should land, they would find no ready supply of food or forage.†

The Conqueror had often felt the want of a naval force, but he had not the same genius for maritime as for military affairs; and it requires more time to make good sailors than to make good soldiers. Knowing, however, that to encourage commerce was the best means of fostering a navy, he repeatedly invited foreigners to frequent his ports, promising that they and their property should be perfectly secure. But he did not live to possess a navy of his own. The spirit of Englishmen, who were more prone to the sea than his Normans, was depressed under his iron rule; nor did this country make any approach towards her naval supremacy until several reigns after.

Another domestic calamity afflicted the latter years of the Conqueror,—for he saw a violent jealousy growing up between his favourite sons, William and Henry. Robert, his eldest son, continued an exile or fugitive; and Richard, his second son in order of birth (but whom some make illegitimate), had been gored to death by a stag* some years before, as he was hunting in the New Forest; and he was noted by the old English annalists as being the first of several of the Conqueror's progeny that perished in that place,—"the justice of God punishing in him his father's dispeopling of that country."

Perhaps no single act of the Conqueror inflicted more misery within the limits of its operation, and, certainly, none has been more bitterly stigmatised than his seizure and wasting of the lands in Hampshire, to make himself a hunting-ground. Like most of the great men of the time, who had few other amusements, William was passionately fond of the chase. The Anglo-Saxon kings had the same taste, and left many royal parks and forests in all parts of England, wherein he might have gratified a reasonable passion; but he was not satisfied with the possession of these, and resolved to have a vast hunting-ground "for his insatiate and superfluous pleasure" in the close neighbourhood of the royal city, Winchester, his favourite place of residence. In an early part of his reign he therefore seized all the south-western part of Hampshire, measuring thirty miles from Salisbury to the sea, and in circumference not much less than ninety miles. This wide district, before called Ytene or Ytchtene (a name yet partially preserved), was to some extent uninhabited, and fit for the purposes of the chase, abounding in sylvan spots and coverts; but it included, at the same time, many fertile and cultivated ma ors, which he caused to be totally absorbed in the surrounding wilderness, and many towns or villages, with no fewer than thirty-six mother or parish churches, all which he demolished, and drove away the people, making them no compensation. According to the indisputable authority of Domesday-Book, in which we have an account of the state of this territory both before and after its "afforestation," the damage done to private property must have been immense. In an extent of nearly ninety miles in circumference, *one hundred and eight* places, manors, villages, or hamlets suffered in a greater or less degree.† Some melancholy traces of these ancient abodes of the Anglo-Saxons are still to be found in the recesses of the New Forest, and have been de-

* Southey, Naval. Hist.—Snorre, Antiq. Celto-Scand.
† Saxon Chron.

* Other accounts say he was killed by a "pestilent blast" which crossed him while hunting; but we believe all fix the scene of his death in the New Forest.
† Warner, Topographical Remarks on the South-Western parts of Hampshire.

scribed by a gentleman * who has passed much of his life in and near those woods, and who is the successor in office to Sir Walter Tyrrell, as bow-bearer to the king. In many spots, though no ruins are visible above ground, either the line of erections can be traced by the elevation of the soil, or fragments of building materials have been discovered on turning up the surface. The traditional names of places still used by the foresters, such as "Church-place," "Church-moor," "Thomson's Castle," seem to mark the now solitary spots as the sites of ancient buildings where the English people worshipped their God, and dwelt in peace, before they were swept away by the Conqueror; and the same elegant writer we have last referred to suggests that the termination of *ham* and *ton*, yet annexed to some woodlands, may be taken as evidence of the former existence of hamlets and towns in the forest.†

We have entered into these slight details because some foreign writers, at the head of whom is Voltaire, have professed a disbelief of the early history of the New Forest, and because some native writers, including even Dr. Warton, who was "naturally disposed to cling to the traditions of antiquity," fancying there were no existing ruins or traces of such desolation, have doubted whether William destroyed villages, castles, and churches, though that demolition is recorded by chroniclers who wrote a very short time after the event, and is proved beyond the reach of a doubt by Domesday-Book. If any other proof were necessary, it ought to be found in the universal tradition of the people in all ages, that on account of the unusual crimes and cruelties committed *there* by William, God made the New Forest the death-scene of three princes of his own blood. The seizure of a waste or wholly uninhabited district would have been nothing extraordinary: it was the sufferings of the people, who were driven from their villages,—the wrongs done the clergy, whose churches were destroyed, that made the deep and ineffaceable impression.‡

At the same time that the Conqueror thus enlarged the field of his own pleasures at the expense of his subjects, he enacted new laws, by which he prohibited hunting in any of his forests, and rendered the penalties more severe than ever had been inflicted for such offences. At this period the killing of a man might be atoned for by payment of a moderate fine or composition: but not so, by the New Forest laws, the slaying of one of the king's beasts of chase. "He ordained," says the Saxon chronicle, "that whosoever should kill a stag or a deer should have his eyes torn out: wild boars were protected in the same manner as deer, and he even made statutes equally severe to preserve the hares. This savage king loved wild beasts as if he had been *their father!*" These forest laws, which were executed with rigour against the English, caused great misery, for many of them depended on the chase as a chief means of subsistence. By including in his royal domain all the great forests of England, and insisting on his right to grant or refuse permission to hunt in them, William gave sore offence to many of his Norman nobles, who were as much addicted to the sport as himself, but who were prohibited from keeping sporting dogs, even on their own estates, unless they subjected the poor animals to a mutilation of the fore-paws, that rendered them unfit for hunting. From their first establishment, and through their different gradations of "forest laws" and "game laws," these jealous regulations have constantly been one of the most copious sources of dissension, litigation, violence, and bloodshed.

Towards the end of the year 1086, William summoned all the chiefs of the army of the Conquest, the sons of those chiefs, and every one to whom he had given a fief, to meet him at Salisbury. All the barons and all the abbots came, attended with men-at-arms and part of their vassals; the whole assemblage, it is said, amounting to 60,000 men. The chiefs, both lay and churchmen, took again the oath of allegiance and homage to the king; but the assertion, that they rendered the same to Prince William, as his successor, seems to be without good foundation. Shortly after receiving these new pledges, William, accompanied by his two sons, passed over to the continent, taking with him "a mighty mass of money fitted for some great attempt," and being followed by the numberless curses of the English people. The enterprise he had on hand was a war with France, for the possession of the city of Mantes, with the territory situated between the Epte and the Oise, which was then called the country of Vexin. William, at first, entered into negotiations for this territory, which he claimed as his right; but Philip, the French king, after amusing his rival for a while with quibbles and sophisms, marched troops into the country, and secretly authorised some of his barons to make incursions on the frontiers of Normandy. During the negotiations William fell sick, and kept his bed. As he advanced in years he grew excessively fat, and, spite of his violent exercise, his indulgence in the pleasures of the table had given him considerable rotundity of person. On the score of many grudges, his hatred of the French king was intense; and Philip now drove him to frenzy, by saying, as a good joke among his courtiers, that his cousin William was a long while lying in, but that no doubt there would be a fine churching when he was delivered. On hearing this coarse and insipid jest, the conqueror of

* William Stewart Rose, Esq. The office of bow-bearer for the New Forest is now, of course, a sinecure, and it is almost purely honorary,—the salary being forty shillings in the year and one buck in the season. In his oath of office the bow-bearer swears "to be of good behaviour towards his Majesty's wild beasts."

† See notes to "The Red King," a spirited poem, in which the manners and costume of the period are carefully preserved. Mr. Rose justly observes, "That this cannot be considered as one of those 'historical doubts,' the solution of which involves nothing beyond the mere disentanglement of an intricate knot. It may be considered as making one of a series of acts of tyranny, unvarnished with any plea which might palliate or disguise its enormity, and, as such, forming a curious feature in the history of manners."

‡ According to most of the old writers some monasteries were also destroyed. As the Saxon buildings were chiefly of wood, it is natural that the traces left of them should be slight.

England swore by the most terrible of his oaths—by the splendour and birth of Christ—that he would be churched in Nôtre Dame, the cathedral of Paris, and present so many wax torches, that all France should be set in a blaze.*

It was not until the end of July (1087) that he was in a state to mount his war-horse, though it is asserted by a contemporary that he was convalescent before then, and expressly waited that season to make his vengeance the more dreadful to the country. The corn was almost ready for the sickle, the grapes hung in rich, ripening clusters on the vines, when William marched his cavalry through the corn-fields, and made his soldiery tear up the vines by the roots, and cut down the pleasant trees. His destructive host was soon before Mantes, which was either taken by surprise and treachery, or offered but a feeble resistance. At his orders, the troops fired the unfortunate town, sparing neither church nor monastery, but doing their best to reduce the whole to a heap of ashes. As the Conqueror rode up to view the ruin he had made, his horse put his fore-feet on some embers or hot cinders, which caused him to swerve or plunge so violently, that the heavy rider was thrown on the high pummel of the saddle, and grievously bruised. The king dismounted in great pain, and never more put foot in stirrup. † He was carried slowly in a litter to Rouen, and again laid in his bed. The bruize had produced a rupture, and being in a bad habit of body, and somewhat advanced in years, it was soon evident to all, and even to himself, that the consequence would be fatal. Being disturbed by the noise and bustle of Rouen, and no doubt desirous of dying in a holy place, he had himself carried to the monastery of St. Gervas, outside of the city walls. There he lingered for six weeks, surrounded by doctors who could do him no good, and by priests and monks, who, at least, did not neglect the opportunity of doing much good for others. Becoming sensible of the approach of death, his heart softened for the first time; and though he preserved his kingly decorum, and conversed calmly on the wonderful events of his life, he is said to have felt the vanity of all human grandeur, and a keen remorse for the crimes and cruelties he had committed. He sent money to Mantes, to rebuild the churches he had burned, and he ordered large sums to be paid to the churches and monasteries in England; "in order," says an old chronicler, "that he might obtain remission for the robberies he had committed there." It was represented to him, that one of the best means of obtaining mercy from God was to show mercy to man; and at length he consented to the instant release of his state-prisoners, some of whom had pined in dungeons for more than twenty years. Of those that were English among these captives, the most conspicuous were, Earl Morcar, Beorn, and Ulnoth, or Wulnot, the brother of Harold: of the Normans, Roger Fitz-Osborn, formerly Earl of Hereford, and Odo, bishop of Bayeux, his own half-brother. The pardon which was wrung from him with most difficulty was that of Odo, whom, at first, he excepted in his act of grace, saying he was a fire-brand, that would ruin both England and Normandy if set at large.

His two younger sons, William and Henry, were assiduous round the death-bed of the king, waiting impatiently for the declaration of his last will. A day or two before his death, the Conqueror assembled some of his chief prelates and barons in his sick chamber, and declared in their presence that he bequeathed the duchy of Normandy, with Maine and its other dependencies, to his eldest son, Robert, whom, it is alleged, he could not put aside in the order of succession, as the Normans were mindful of the oaths they had taken, with his father's consent, to that unfortunate prince, and were much attached to him. "As to the crown of England," said the dying monarch, "I bequeath it to no one, as I did not receive it, like the duchy of Normandy, in inheritance from my father, but acquired it by conquest and the shedding of blood with mine own good sword. The succession to that kingdom I therefore leave to the decision of God, only desiring most fervently that my son William, who has ever been dutiful to me in all things, may obtain it, and prosper in it." "And what do you give unto me, O my father?" impatiently cried Prince Henry, who had not been mentioned in this distribution. "Five thousand pounds' weight of silver out of my treasury," was his answer. "But what can I do with five thousand pounds of silver, if I have neither lands nor a home?" "Be patient," replied the king, "and have trust in the Lord; suffer thy elder brothers to precede thee—thy time will come after their's."* Henry went straight, and drew the silver, which he weighed with great care, and then furnished himself with a strong coffer, well protected with locks and iron bindings, to keep his treasure in. William left the king's bed-side at the same time, and, without waiting to see the breath out of the old man's body, hastened over to England to look after his crown.

About sunrise, on the 9th of September, the Conqueror was for a moment roused from a stupor into which he had fallen by the sound of bells: he eagerly inquired what the noise meant, and was answered that they were tolling the hour of prime in the church of St. Mary. He lifted his hands to heaven, and saying, "I recommend my soul to my Lady Mary, the holy mother of God," instantly expired. The events which followed his dissolution not only give a striking picture of the then unsettled state of society, but also of the character and affections of the men that waited on princes and conquerors. William's last faint sigh was the signal for a general flight and scramble. The knights, priests, and doctors who had passed the night near him, put on their spurs as soon as they

* Chron. de Normand.—Brompton.—It was the custom for women, at their churching, to carry lighted tapers in their hands.

† Orderic.—Anglia Sacra.

* Orderic.

saw him dead, mounted their horses, and galloped off to their several homes, to look after their property and their own interests. The king's servants and some vassals of minor rank, left behind, then proceeded to rifle the apartment of the arms, silver vessels, linen, the royal dresses, and everything it contained, and then were to horse and away like the rest. From prime to tierce,* or for about three hours, the corpse of the mighty conqueror, abandoned by all, lay in a state of almost perfect nakedness on the bare boards. The citizens of Rouen were thrown into as much consternation as could have been excited by a conquering enemy at their gates: they either ran about the streets asking news and advice from every one they chanced to meet, or busied themselves in concealing their movables and valuables. At last the clergy and the monks thought of the decent duties owing to the mortal remains of their sovereign; and, forming a procession, they went with a crucifix, burning tapers, and incense, to pray over the dishonoured body for the peace of its soul. The archbishop of Rouen ordained that the king should be interred at Caen, in the church of St. Stephen's, which he had built and royally endowed. But even now it should seem there were none to do it honour; for the minute relator of these dismal transactions, who was living at the time, says that his sons, his brothers, his relations, were all absent, and that of all his officers, not one was found to take charge of the obsequies, and that it was a poor knight who lived in the neighbourhood who charged himself with the trouble and expense of the funeral, "out of his natural good nature and love of God." The body was carried by water by the Seine and the sea to Caen, where it was received by the abbot and monks of St. Stephen's; other churchmen and the inhabitants of the city joining these, a considerable procession was formed; but as they went along after the coffin a fire suddenly broke out in the town; laymen and clerks ran to extinguish it, and the brothers of St. Stephen's were left alone to conduct the king to the church. Even the last burial service did not pass undisturbed. The neighbour-

* The chroniclers, who were all monks or priests, always count by these and the other canonical hours, as *sexts*, *nones*, *vespers*, &c. The church service, called *prime*, or *prima*, and which immediately succeeded *matins*, began about six A.M., and lasted to *tierce*, or *tertia*, which commenced about nine A.M.

Church of St. Stephen at Caen. Founded by William the Conqueror.

ing bishops and abbots assembled for this ceremony. The mass had been performed; the bishop of Evreux had pronounced the panegyric, and the body was about to be lowered into the grave prepared for it in the church between the altar and the choir, when a man, suddenly rising in the crowd, exclaimed, with a loud voice, "Bishop, the man whom you have praised was a robber; the very ground on which we are standing is mine, and is the site where my father's house stood. He took it from me by violence, to build this church on it. I reclaim it as my right; and in the name of God, I forbid you to bury him here, or cover him with my glebe." The man who spoke thus boldly was Asseline Fitz-Arthur, who had often asked a just compensation from the king in his lifetime. Many of the persons present confirmed the truth of his statement; and, after some parley, the bishops paid him sixty shillings for the grave alone, engaging, at the same time to procure him the full value of the rest of his land. The body, dressed in royal robes, but without a coffin, was then lowered into the tomb; the rest of the ceremony was hurried over, and the assembly dispersed.*

William's management of the affairs of the church, and his dispute with the pope about investitures,—his establishing the feudal system in England, of which, however, he found a ground-work already laid by the Anglo-Saxons,—his survey and register of Domesday, the greatest civil operation of his reign,—the changes his invasion produced in the language and manners of this country,—will all be discussed under their proper heads. His character may be deduced from his deeds—from the details we have given, to which we have little to add. No prince of the time equalled him, either as a general or a politician; and he surpassed them all in the difficult art of bending men's wills, and achieving great things with a turbulent nobility intractable to every one else. His own temper was naturally fiery; and when he had nothing to gain by dissimulation, or to fear from those he insulted, he gave the reins to his passion, and completely forgot that dignity and majesty of demeanour which was in part innate, but still more assumed, to impose upon the herd. A domestic anecdote gives a good notion both of the violence of his temper and his love of good eating. He was so nice and curious in his repasts, that one day when his prime favourite, William Fitz-Osborn, who, as dapifer, or steward of the household, had the charge of the table, served him with the flesh of a crane only half roasted, he was so highly exasperated, that he lifted up his fist, and would have struck him had not Odo warded off the blow. One of the writers of the Saxon Chronicle, who says he "looked on him, and somewhile lived in his herd," describes him as being a very stern man, and so

* Orderic.—Wace, Roman de Rou.—Chron. de Normand. Orderic gives further details respecting the lowering of the body into the grave, but they are too revolting to be translated.

STATUE OF WILLIAM THE CONQUEROR. Placed against one of the external Pillars of St. Stephen, Caen.

hot and passionate, that no man durst gainsay his will; as one who took money by right and unright, falling into great avarice, and loving greediness withal, not recking how sinfully his officers got money of poor men, or how many unlawful things they did. He was, however, religiously inclined, after the fashion of the age; and whatever might be the schemes of ambition, or the butcheries in which he was engaged, he never failed to hear the mass of his private chaplain in the morning, or to say his prayers at night. Dynasties have been changed, and provinces won by war, but William's attempt against England was the last great and permanent conquest of a whole nation achieved in Europe. The companions of his conquest became one people with those they subdued; his power was transmitted to his posterity; and after all the changes and revolutions that have happened in the course of seven centuries and a half, the blood of the reigning family is still kindred to his.

William II.—surnamed Rufus.

Great Seal of William Rufus.

A.D. 1087. William Rufus, or William the Red, who left his father at the point of death, was informed of his decease as he was on the point of embarking at Wissant, near Calais. The news only made him the more anxious to reach England, that he might, by the actual seizure of the succession, set at defiance the pretensions of any other claimant to the crown. Arriving in England, he secured the important fortresses of Dover, Pevensey, and Hastings, concealing his father's death, and pretending to be the bearer of orders from him. He then hastened to Winchester, where, with a proper conviction of the efficacy of money, he claimed his father's treasures which were deposited in the castle there. William de Pont-de-l'Arche, the royal treasurer, readily delivered him the keys, and Rufus took possession of sixty thousand pounds in pure silver, with much gold and many precious stones. His next step was to repair to Lanfranc, the primate, in whose hands the destinies of the kingdom may almost be said to have at that moment been. Bloet, a confidential messenger, had already delivered a letter from the deceased king, commending the cause and guidance of his son William to the archbishop, already disposed by motives both of affection and self-interest in favour of William, who had been his pupil, and for whom he had performed the sacred ceremonies on his initiation into knighthood. It is stated, however, that Lanfranc refused to declare himself in favour of Rufus till that prince promised, upon oath, to govern according to law and right, and to ask and follow the advice of the primate in all matters of importance. It appears that Lanfranc then proceeded with as much activity as Rufus could desire. He first hastily summoned a council of the prelates and barons, to give the semblance of a free election. The former he knew he could influence, and of the latter many were absent in Normandy. Some preferred William's claim and character upon principle, and others were silenced by his presence and promises. Though a strong feeling of opposition existed, none was shown at this meeting; and Lanfranc crowned his pupil at Westminster on Sunday, the 26th of September, 1087, the seventeenth day after the Conqueror's death.

William's first act of royal authority speaks little in his favour either as a man or a son;—it was the imprisonment of the unfortunate Englishmen whom his father had liberated on his death-bed. Earls Morcar and Wulnot, who had followed him to

RUINS OF PEVENSEY CASTLE.

England in the hope of obtaining some part of the estates of their fathers, were arrested at Winchester, and confined in the castle. The Norman state prisoners, however, who had been released at the same time by the Conqueror re-obtained possession of their estates and honours. He then gave a quantity of gold and silver, a part of the treasure found at Winchester, to "Otho, the goldsmith," with orders to work it into ornaments for the tomb of that father whom he had abandoned on his death-bed.

When Robert Courtehose heard of his father's death he was living, an impoverished exile, at Abbeville, or, according to other accounts, in Germany. He, however, soon appeared in Normandy, and was joyfully received at Rouen, the capital, and recognised as their duke by the prelates, barons, and chief men. Henry, the youngest brother of the three, put himself and his five thousand pounds of silver in a place of safety, waiting events, and being fully resolved to avail himself of any means, no matter how dishonourable in themselves, or ruinous to his brothers, that should offer him the chance of gaining either the royal crown or the ducal coronet.

It was not perhaps easy for the Conqueror to make any better arrangement, but it was in the highest degree unlikely, under the division he had made of England and Normandy, that peace should be preserved between the two brothers. Even if the unscrupulous Rufus had been less active, and the personal qualities of Robert altogether different from what they were, causes independent of the two princes threatened to lead to inevitable hostilities. The great barons, the followers of the Conqueror, were almost all possessed of estates and fiefs in both countries: they were naturally uneasy at the separation of the two territories, and foresaw that it would be impossible for them to preserve their allegiance to two masters, and that they must very soon resign or lose either their ancient patrimonies in Normandy or their new acquisitions in England. A war between the two brothers would at any time embarrass them as long as they held territory under both. The time, also, was not yet come to reconcile them to consider their native Normandy as a separate and foreign land. In short, every inducement of interest and of local attachment made them wish to see the two countries united under one sovereign; and their only great difference of opinion on this head was, as to which of the two brothers should be that sovereign; some of them adhering to William, while others insisted that, both by right of birth and the honourableness, generosity, and popularity of his character, Robert was the proper man to have both realms. A decision of the question was inevitable; and the first step was taken, not in Normandy, to expel Robert, but in England, to dethrone William. Had he been left to himself, the elder brother, from his love of ease and pleasure, would in all probability have remained satisfied with his duchy, but he was

beset on all sides by men who were constantly repeating how unjust and disgraceful to him it was to see a younger brother possess a kingdom while he had only a duchy,—by Norman nobles that went daily over to him complaining of the present state of affairs in England,—and by his uncle Odo, the bishop of Bayeux, who moved with all his ancient energy and fierceness in the matter, not so much out of any preference of one brother to the other, as out of his hatred of the primate Lanfranc, whom he considered as the chief cause of the disgrace, the imprisonment, and all the misfortunes that had befallen him in the latter years of the Conqueror, and whose great credit at court, and power in the new government, excited his jealousy. The bishop was a formidable partisan, a man framed to be the leader of a conspiracy: he had many friends among the most powerful of the barons; but so abhorred was he by all classes of English, that it may be doubted whether he did not rather weaken than strengthen the party he embraced.

Robert promised to come over with an army in all haste, and Odo engaged to do the rest. At the Easter festival the Red King kept his court at Winchester, whither he had invited all the great lords. Odo was there with his friends, and took that opportunity of arranging his plans. From the festival he departed to raise the standard of Robert in his old earldom of Kent, while Hugh de Grantmesnil, Roger Bigod, Robert de Mowbray, Roger de Montgomery, William bishop of Durham, and Geoffrey of Coutance, repaired to do the like in their several fiefs and governments which lay in the east, in the west, and the north. A dangerous rising thus took place simultaneously in many parts of England; but the insurgents lost time, and turned the hearts of the English inhabitants from them by paltry acts of depredation, while the army from Normandy, with which Robert had promised to come over, and which Odo, who was in Kent, was instructed to look out and provide for upon the south coast of England, at a certain time appointed, was slow in making its appearance. The Courtehose, a slave to his habitual indolence and indecision, was, as usual, in great straits for money; but those who acted for him had raised a considerable force in Normandy, and but for the adoption, by the new king, of a novel measure, and a confidence timely placed in the natives, England would have been again desolated by a foreign army. Rufus, on learning the preparations that were making for this armament, permitted his English subjects to fit out cruisers; and these adventurers, who seem to have been the first that may be called privateers, rendered him very important service; for the Normans, calculating that there was no royal navy to oppose them, and that when they landed they would be received by their friends and confederates, the followers of Odo and his party, began to cross the Channel in small companies, each at their own convenience, without concert or any regard to mutual support in case of being attacked on their passage; and so many of them were intercepted and destroyed by the English cruisers, that the attempt at invasion was abandoned in consequence.* But Rufus was also greatly indebted to another measure which he adopted at this important crisis. Before the success of the privateering experiment could be fully ascertained, seeing so many of the Normans arrayed against him, he had recourse to the native English: he armed them to fight in their own country against his own countrymen and relatives; and it was by this confidence in them that he preserved his crown, and probably his life. He called a meeting of the long-despised chiefs of the Anglo-Saxon blood,—of those few men having influence over the national mind, who had survived the slow and wasting conquest of his father: he promised that he would rule them with the best laws they had ever known; that he would give them the right of hunting in the forests, as their forefathers had enjoyed it; and that he would relieve them from many of the taillages and odious tributes his father had imposed.† These promises were indifferently kept in the sequel, but the English people certainly benefited somewhat by the king's difficulties, and commenced from this moment an improvement in condition and consideration, which continued, on the whole, progressive under his successors. "Contested titles and a disputed succession," as Sir James Mackintosh has remarked, "obliged Rufus and his immediate successors to make concessions to the Anglo-Saxons, who so much surpassed the conquering nation in numbers; and these immediate sources of terrible evils to England became the causes of its final deliverance."‡ Flattered by his confidence, the thanes and franklins who had been summoned to attend him zealously promoted the levy; and when Rufus proclaimed his ban of war in the old Saxon form,—"Let every man who is not a man of nothing,§ whether he live in burgh or out of burgh, leave his house and come,"—there came thirty thousand stout Englishmen to the place appointed for the muster.

Kent, with the Sussex coast, was the most vulnerable part of the island, and Odo, the king's uncle, the most dangerous of his enemies; Rufus therefore marched against the bishop, who had strongly fortified Rochester Castle, and then thrown himself into Pevensey, there to await the arrival of the tardy and never-coming Robert. After a siege of seven weeks, the bishop was obliged to surrender this stronghold, and his nephew granted him life and liberty, on his taking an oath that he would put Rochester Castle into his hands, and then leave the kingdom for ever. Relying on his solemn vow, Rufus sent the prelate with an inconsiderable escort of Norman horse from Pevensey to Rochester. The strong castle of Rochester Odo had intrusted to the

§ In Anglo-Saxon, a "nidering," or "unnithing,"—one of the strongest terms of contempt. The expressions of the Saxon Chronicler are, "Baed thaet aele man the waere unnithing sceolde cuman to him—Frencisce and Englisce—of porte and of upplande."

ROCHESTER CASTLE; THE KEEP WITH ITS ENTRANCE TOWER.

care of Eustace, Earl of Boulogne, who was devoted, like himself, to the eldest son. When now reciting the set form of words, he demanded of the earl the surrender of the castle, Eustace, pretending great wrath, arrested both the bishop and his guards as traitors to King Robert. The scene was well acted, and Odo, trusting to be screened from the accusation of perjury, remained in the fortress to continue the struggle. His loving nephew soon embraced him with a close environment, drawing round him a great force of English infantry and foreign cavalry. But the castle was strong and well garrisoned, for 500 Norman knights, without counting the meaner sort, fought on the battlements; and after a long siege, the place was not taken by assault, but forced to surrender either by pestilential disease or famine, or probably by both. The English, who had shown great ardour during the siege, would have granted no terms of capitulation; but the Norman portion of William's army, who had countrymen, and many of them friends and relations in the castle, entertained very different sentiments, and at their earnest instance, though not without difficulty, the Red King allowed the besieged, without any exceptions, to march out with their arms and horses, and freely depart the land. The unconscionable bishop of Bayeux would have included in the capitulation a proviso that the king's army should not cause their band to play in sign of victory and triumph as the garrison marched out, but this condition was refused, the king saying in great anger he would not make such a concession for 1000 marks of gold. The partisans of Robert then came forth with banners lowered, and the king's music playing the while. As Odo appeared, there was a louder crash; the trumpets screamed, and the English, scarcely able to keep their hands from his person, shouted as he passed, "Oh! for a halter to hang this perjured, murderous bishop!" It was with these and still worse imprecations that the priest who had blessed the Norman army at the battle of Hastings departed from England never more to enter it.*

Having disposed of Odo, Rufus found no very great difficulty in dealing with the other conspirators, who began to curse the procrastination of Robert, and to see pretty clearly that he was *not* the man to re-unite the two countries, or give them security for their estates and honours in both. Roger Montgomery, the powerful Earl of Shrewsbury, was detached from the confederacy by a peaceful negotiation; others were won over by blandishments: the bishop of Durham was defeated by a division of William's army, and the bishop of Worcester's English tenants, adhering

* Thierry.—Chron. Sax.—Orderic. Vital.

to William, killed a host of the insurgents. The remaining chiefs of the confederacy either submitted on proclamation or escaped into Normandy. A few of them received a pardon, but the greater part were attainted, and Rufus bestowed their English estates on such of the barons as had done him best service.

In the course of the following year (1089), Lanfranc, who was in many respects a great and a good man, departed this life. A change was immediately observed in the king, who showed himself more debauched, tyrannical, and rapacious than he had been when checked by the primate's virtues and abilities. He appointed no successor to the head office in the church, but seized the rich revenues of the archbishopric of Canterbury, and spent them in his unholy revelries. Lanfranc had been, in fact, chief minister as well as primate of the kingdom. As minister, he was succeeded by a Norman clergyman of low birth and dissolute habits, but gifted with an aspiring spirit, great readiness of wit, engaging manners, and an unhesitating devotion to the king in all things. He had first attracted attention in the English court of the Conqueror as a skilful spy and public informer. His name was Ralph, to which, in his capacity of minister, and through his violent measures, he soon obtained the significant addition of *le Flambard*, or the destructive torch. His nominal offices in the court of the Red King were, royal chaplain, treasurer, and justiciary;—his real duties, to raise as much money as he could for his master's extravagant pleasures, and to flatter and share his vices. He was ingeniously rapacious, and seems almost to have exhausted the art of extortion. Under this priest the harsh forest laws were made a source of pecuniary profit; new offences were invented for the multiplication of fines; another survey of the kingdom was begun, in order to raise the revenues of the crown from those estates which had been underrated in the record of Domesday;* and all the bishoprics and abbeys that fell vacant by death were left so by the king, who drew their revenues and applied them to his own use, racking the tenants and vassals on the church-lands so as they had never been racked before. These latter proceedings could hardly fail to indispose the monastic chroniclers, and the character of the Red King has in consequence come down to us darkened with perhaps rather more than its real depravity. There is, however, no reasonable ground for doubting that he was a licentious, violent, and rapacious king, nor (as has been well observed) is there either wisdom or liberality of sentiment in excusing his rapacity because it comprehended the clergy, who, after all, were the best friends of the people in those violent times.*

A.D. 1090. The barons who had given the preference to Robert having failed in their attempts to deprive William of England, the friends of William now determined to drive Robert out of Normandy, which country had fallen into a state of complete anarchy through the imprudent conduct of the new duke. The turbulent barons expelled Robert's troops from nearly all the fortresses, and then armed their vassals and made war with one another on their own private account. Many would have preferred this state of things, which left them wholly independent of the sovereign authority, to any other condition; but those of the great lords, who chiefly resided in England, were greatly embarrassed by it, and resolved it should cease. By treachery and bribery, possession was obtained of Aumale, or Albemarle, St. Vallery, and other Norman fortresses, which were forthwith strongly garrisoned for Rufus. Robert was roused from his lethargy, but his coffers were empty, and the improvident grants of estates he had already made left him scarcely anything to promise for future services; he therefore applied for aid to his friend and feudal superior, the French king, who marched an army to the confines of Normandy as if to give assistance, but marched it back again on receiving a large amount of gold from the English king. At the same time the unlucky Robert nearly lost his capital by a conspiracy; Conan, a wealthy and powerful burgess, having engaged to deliver up Rouen to Reginald de Warenne for King Rufus. In these difficulties Robert claimed the assistance of the cautious and crafty Henry. Some very singular transactions had already taken place between these two brothers. While Robert was making his preparations to invade England, Henry advanced him 3000*l.*, in return for which slender supply he had been put in possession of the Cotentin country, which comprehended nearly a third part of the Norman duchy. Dissensions followed this unequal bargain, and Robert on some other suspicions, either threw Henry into prison for a short time, or attempted to arrest him. Now, however, the youngest brother listened to the call of the eldest, and joined him at Rouen, where he chiefly contributed to put down the conspiracy, to repulse King William's adherent, Reginald de Warenne, who came up with 300 choice knights, and to take Conan, the great burgess, prisoner. The mild and forgiving nature of Robert was most averse to capital punishment, and he condemned Conan to a perpetual imprisonment; but Henry, some short time after, took the captive to the top of a high tower on pretence of showing him the beauty of the surrounding scenery, and while the eye of the unhappy man rested on the pleasant landscape, he suddenly seized him by the waist and flung him over the battlements. Conan was dashed to pieces by the fall, and the prince coolly observed to those who saw the catastrophe

* The measurements in Domesday appear to have been made with a reference to the quality as well as the quantity of the land in each case, whereas Flambard is said to have caused the hides to be measured exactly by the line, or without regard to anything but their superficial extent. Sir Francis Palgrave believes that a fragment of Flambard's Domesday is preserved in an ancient Lieger or Register Book of the Monastery of Evesham, now in the Cottonian Library, in MS. Vespasian, B. xxiv. It relates to the county of Gloucester, and must have been compiled between 1096 and 1112. See an account of this curious and hitherto unnoticed relic, with extracts, in Sir Francis's Rise and Progress of the English Commonwealth, ii. cccexiviii. &c.

* Mackintosh, Hist of Eng. i. 119.—Sugeri Vit. Ludovic. Grossi.—Ingulph.—Malmsb.—Ordericus.

that it was not fitting that a traitor should escape condign punishment.*

A.D. 1091. In the following January William Rufus appeared in Normandy, at the head of an army, chiefly English. The affairs of the king and duke would have now come to extremity, but Robert again called in the French king, by whose mediation a treaty of peace was concluded at Caen. Rufus, however, gained almost as much by this treaty as a successful war could have given him. He retained possession of all the fortresses he had acquired in Normandy, together with the territories of Eu, Aumale, Fescamp, and other places; and secured, in addition, the formal renunciation on the part of Robert of all claims and pretensions to the English throne. On his side, William engaged to indemnify his brother for what he resigned in Normandy by an equivalent in territorial property in England, and to restore their estates to all the barons who had been attainted in Robert's cause. It was also stipulated between the two parties that the king, if he outlived the duke, should have Normandy; and the duke, if he outlived the king, should have England; the kingdom and duchy thus in either case to be united as under the Conqueror: and twelve of the most powerful barons on each side swore that they would do their best to see the whole of the treaty faithfully executed—"a strong proof" observes Hume, "of the great independence and authority of the nobles in those ages."

* Orderic.—Malms.

The family of the Conqueror were not a family of love. No sooner were the bonds of fraternal concord gathered up between Robert and William, than they were loosened between them and their younger brother Henry, whose known abilities and decision of character began to inspire jealous apprehensions in the breast of Rufus. The united forces of the duke and king proceeded to take possession of his castles; and Henry was obliged to retire to a fortress on Mount St. Michael,* a lofty rock on the coast of Normandy, insulated at high water by the sea. In this almost impregnable position he was besieged by Robert and William. Most of the old historians delight in telling a story to show the difference between the characters of these two kinsmen. Mount St. Michael afforded no fresh water: the besieged had neglected to supply themselves elsewhere, and were reduced to feel the insufferable anguish of thirst. When Robert heard of Henry's distress, he permitted some of his people to go and take water, and also sent him a supply of wine for his own table. William reproved him for this ill-timed generosity; but Robert replied, "How can I suffer my brother to die of thirst? Where shall we find another brother when he is gone?"* Another anecdote of the same time is told of Rufus. As he was riding one day alone near the fortress, he was attacked by two soldiers in Henry's pay, and dismounted. One of the men raised his dagger to dispatch him, when

* William of Malmsbury is the first teller of this story among the chroniclers.

MOUNT ST. MICHAEL, NORMANDY.

Carlisle.

Rufus exclaimed, "Hold, knave! I am the king of England." The soldier suspended his blow, helped the king to rise and mount, excusing his own conduct, on the ground of being ignorant of his quality. "Make no excuse," replied Rufus; "thou art a brave knight, and henceforward wilt fight under my banner." The story, in conclusion, says the man entered the king's service. In the end, Prince Henry was obliged to capitulate and evacuate the strong fortress of Mount St. Michael. He obtained with difficulty permission to retire into Brittany: he was despoiled of all he possessed, and wandered about for two years, with no better attendance than grim poverty, one knight, three squires, and a chaplain. But in this, the lowest stage of his fortunes, he impressed men with a notion of his political abilities; and he was invited by the inhabitants of Damfront to take upon himself the government of that city.

Duke Robert accompanied the king to England, to take possession of those territories which were promised by the treaty. During his stay Rufus was engaged in a war with Malcolm Caenmore, who, while William was absent in Normandy, had invaded England, and "overrun a great deal of it," says the Saxon Chronicle, "until the good men that governed this land sent an army against him and repulsed him." On his return, William collected a great force both naval and military, to avenge this insult; but his ships were all destroyed before they reached the Scottish coast. The English and Scottish armies met, however, in Lothian, in England, according to the Saxon Chronicle—at the river called Scotte Uatra (perhaps Scotswater), says Ordericus Vitalis—and were ready to engage, when a peace was brought about by the mediation of Duke Robert on one side, and his old friend Edgar Atheling on the other. "King Malcolm," says the Saxon Chronicle, "came to our king, and became his man, promising all such obedience as he formerly rendered to his father; and that he confirmed with an oath. And the King William promised him in land and in all things whatever he formerly had under his father." By the same treaty, Edgar Atheling was permitted to return to England, where he received some paltry court appointment, and "exhibited the unseemly sight of the representative of Alfred, fed on the crumbs that fell from the table of a Norman tyrant."*

Returning from Scotland, Rufus was much struck with the favourable position of Carlisle; and, expelling the lord of the district, he laid the foundation of a castle, and soon after sent a strong English colony from the southern counties to settle in the town and its neighbourhood. Carlisle, with the whole of Cumberland, had long been an appanage of the elder son of the Scottish kings; and this act of Rufus was speedily followed by a renewal of the quarrel between him and Malcolm Caenmore. To accommodate these differences, Malcolm was invited to Gloucester, where William

* Sir J. Mackintosh, Hist. Eng

was keeping his court; but before undertaking this journey the Scottish king demanded and obtained hostages for his security—a privilege not granted to the ordinary vassals of the English crown.* On arriving at Gloucester, however, Malcolm was required by Rufus to do him right, that is, to make him amends for the injuries with which he was charged, in his court there, or, in other words, to submit to the opinion and decision of the Anglo-Norman barons. Malcolm rejected the proposal, and said that the kings of Scotland had never been accustomed to do right to the kings of England, except on the frontiers of the two kingdoms, and by judgment of the barons of both.† He then hurried northward, and, having raised an army, burst into Northumberland, where he soon afterwards fell into an ambush, and was slain, together with Edward, his eldest son. This double calamity is said to have caused the death of the Scottish queen, Margaret, Edgar Atheling's sister; she died four days after (16th November, 1093).

Duke Robert had returned to the continent in disgust, at having pressed his claims for the promised indemnity in England without any success. He afterwards dispatched messenger after messenger from the continent, but still William would give up none of his domains. At last, in 1094, Robert had recourse to a measure deemed very efficacious in the court of chivalry. He sent two heralds, who, having found their way into the presence of the Red King, denounced him before his chief vassals, as a false and perjured knight, with whom his brother, the duke, would no longer hold friendship. To defend his honour, the king followed the two heralds to Normandy, where, hoping at least for the majority of voices, he agreed to submit the matters in dispute to the arbitration of the twenty-four barons, who had sworn to do their best to enforce the faithful observance of the treaty of Caen. The barons, however, decided in favour of Robert; and then William, who would not be bound by an award unfavourable to himself, appealed to the sword. The campaign which opened went so much in favour of the Red King, that Robert was again obliged to apply for assistance to the king of France; and Philip once more marched with an army into Normandy. Rufus then sustained some serious losses; and trusting no longer to the appeal of the sword, he resolved to buy off the French king. He sent his commission into England for the immediate levying of 20,000 men. By the time appointed these men came together about Hastings, and were ready to embark, "when suddenly there came his lieutenant with a counter-order, and signified to them, that the king, minding to favour them, and spare them for that journey, would that every of them should give him ten shillings towards the charges of the war, and thereupon depart home with a sufficient safe conduct; which the most part were better content to do than to commit themselves to the fortune of the sea and bloody success of the wars in Normandy."* The king's lieutenant and representative on this occasion was Ralph Flambard; and he and that priest probably shared the ingenuity of the device between them. It seems difficult to conceive that 20,000 soldiers, or half of them, should be able to pay ten shillings a piece;† but still some considerable sum was raised, and King Philip accepted it, and withdrew from the field, leaving Robert, as he had done before, to shift for himself. Rufus would then in all probability have made himself master of Normandy, had he not been recalled to England and detained there by important events.

A.D. 1094-5. The Welsh hearing of the variance between the two brothers, "after their accustomed manner," began to invade the English marches, taking booty of cattle, and destroying, killing, and spoiling many of the king's subjects, both English and Normans. Laying siege to the castle of Montgomery, which had been erected on a recently occupied part of Wales, they took this castle by assault, and slew all whom they found within it. Before William could reach the scene of action all the Welsh were in arms, and had overrun Cheshire, Shropshire, and Herefordshire, besides reducing the isle of Anglesea. To chastise them, he determined to follow them, as Harold had done before,‡ quite through their own country; for he saw that the Welsh "would not join battle with him in the plain, but kept themselves still aloof within the woods and marshes, and aloft upon the mountains: albeit, oftentimes when they saw advantage they would come forth, and taking the Normans and the English unawares, kill many, and wound no small numbers."§ Stimulated, however, by the example of Harold, who had penetrated into the inmost recesses of Wales, the Red King still pursued them by hill and dale; but by the time he reached the mountains of Snowdon, he found that his loss was tremendous, and "not without some note of dishonour," began a retreat, which was much more rapid than his advance. The next summer he entered the mountains with a still more numerous army, and was again forced to retire with loss and shame. He had not imitated the wise generalship of Harold; and his heavy Norman cavalry was ill suited for such a warfare. He turned from Wales in despair, but ordered the immediate erection of a chain of forts and castles along the frontier.

Before he was free from the troubles of this Welsh war his throne was threatened by a formidable conspiracy in the north of England, the full extent of which was discovered in a curious manner. The exclusive right claimed by Rufus

† Flor. Wigorn.—Sim. Dun.

* Holinshed. The old authorities are Matthew Paris and Simeon Dunelmensis.
† It is said, however, that these particular soldiers were purposely chosen among men "well to pass," or who were in comparatively good circumstances. Dr. Lingard, on the other hand, is of opinion that ten shillings was the sum each man had received from his lord for purchasing victuals during the campaign; but this does not appear probable.
‡ See ante, p. 195.
§ Holinshed.

over all the forests continued to irritate the Norman barons, and other causes of discontent were not wanting. At the head of the disaffected was Robert Mowbray, Earl of Northumberland, a most powerful chief, who possessed 280 English manors. His long-continued absence from court created suspicion, and he is said to have committed several illegal acts in his government, militating against the royal authority. The king published a decree that every baron who did not present himself at court on the approaching festival of Whitsuntide should be outlawed. The festival came and passed without any tidings of the Earl of Northumberland, who feared he should be cast into prison if he went to the south, his demand for hostages for his safety having been refused, as a privilege to which the earl, as an ordinary vassal of the crown, could not pretend. The king then marched with an army into Northumberland, and after taking several of his less important fortresses, shut up the earl within the walls of Bamborough Castle. Finding he could neither besiege nor blockade this impregnable place, he built another castle close to it, in which, leaving a strong garrison, he returned to the south. The new castle, which was hastily constructed of wood, was called "Malvoisin," (the bad neighbour,) and such it proved to Earl Mowbray. Being decoyed from his safe retreat by a feigned offer of placing the town of Newcastle-upon-Tyne in his hands, he was attacked by a large party of Normans from Malvoisin, who lay in wait for him. The earl, with thirty horsemen, his only retinue, fled to the Monastery of St. Oswin, at Tynemouth. The sanctuary was not respected; but Mowbray and his few followers defended it with desperate valour for six days, at the end of which the earl, sorely wounded, was made prisoner. But Bamborough Castle was even more valuable than the person of this noble captive, and the Red King, who had laid the snare into which the earl had fallen, had also arranged the plan upon which the captors now acted. They carried Mowbray to a spot in front of his castle, and invited his countess, the fair Matilda, to whom he had been married only a few months, to a parley. When the countess came to the outer walls, she saw her husband in the hands of his bitter enemies, who told her they would put out his eyes before her face unless she instantly delivered up the castle. It was scarcely for woman to hesitate in such an alternative: Matilda threw open the gates. Within the walls of Bamborough the king's men found more than they expected, for Earl Mowbray's lieutenant betrayed to them the whole secret of the conspiracy, the object of which was to place upon the throne of England Stephen, Count of Aumale, nephew of the Conqueror and brother to the infamous Judith. The extensive conspiracy included, among others, William Count of Eu, a relation of the king's, William of Alderic, the king's godfather, Hugh, Earl of Shrewsbury, Odo, Earl of Holderness, and Walter de Lacey. The fates of these men were various: Earl Mowbray was condemned to perpetual imprisonment, and died in a dungeon of Windsor Castle, about thirty years after; the Count of Eu rested his justification on the issue of a duel, which he fought with his accuser in the presence of the king and court, but being vanquished in the combat, he was convicted, according to the prevailing law, and condemned to have his eyes torn out, and to be otherwise mutilated.* William of Alderic, who was much esteemed and lamented, was hanged; the Earl of Shrewsbury bought his pardon for an immense sum of money; the Earl of Holderness was deprived of all he possessed and imprisoned; the rest escaped to the continent, leaving their estates in England to be confiscated. It appears that part at least of the lands thus forfeited remained for some time without masters, and without culture; but the revenue officers, that the king might not suffer, continued to raise on the town or the district to which the vacant property appertained the whole of the taxes as before. The people of Colchester rendered most grateful thanks to Eudes Fitz-Hubert, the governor of their town, for his having taken, in his own name, some of the estates of the disinherited Normans, and consented to pay all the fiscal demands made on those lands.

A.D. 1096. At a moment when the Red King had successfully disposed of all his enemies in England, and was in a condition to renew the war in Normandy, his thoughtless brother resigned that duchy to him for a sum of money. The Christians of the west, no longer content to appear at Jerusalem as despised and ill-treated pilgrims, with beads and crosses in their hands, resolved to repair thither with swords and lances, and conquer the whole of Palestine and Syria from the infidels. The subject of the Crusades, one of the most interesting that engages the attention of the historian in the middle ages, will be treated of more appropriately in our account of the religion of the times, which was the direct source of those enthusiastic and long-enduring enterprises. It will suffice here to state, that the preaching of Peter the Hermit, the decisions of the council of Clermont, and the bulls of Pope Urban II., had kindled a warlike flame throughout Europe, and that all classes of men considered taking a part in the holy war as the surest means of obtaining glory in this world and eternal happiness in the next. Duke Robert had early enlisted in the crusade, engaging to take with him a numerous and well-armed body of knights and vassals, but, wanting money, "no news to his coffers," he applied to his brother the Red King, who was always as expert in the employment of gold as of arms, and who now readily entered into a bargain, which was concluded on terms most advantageous to himself. For the sum of 10,000*l.* the duke resigned the government of Normandy to his brother. This act is generally considered by historians not as a sale, but as a mortgage, which was to expire in five years. But it is almost idle to talk of conditions in such a

* Cæcatus et extesticulatus est.—Malms.

strange transaction, which could have left Robert but a slight chance of ever recovering his dominion from his unscrupulous brother, had Rufus lived. When the bargain was struck, William was almost as pennyless as Robert, but he was a much greater adept in the art of wringing money from his subjects. According to an old historian, to make up this sum with dispatch, "he did not only oppress and fleece his poor subjects, but rather with importunate exactions, did, as it were, flea off their skins. All this was grievous and intolerable, as well to the spirituality as temporality, so that divers bishops and abbots, who had already made away with some of their chalices and church jewels to pay the king, made now plain answer that they were not able to help him with any more; unto whom, on the other side, as the report went, the king said again: 'Have you not, I beseech you, coffins of gold and silver full of dead men's bones?'"* meaning the shrines wherein the relics of saints were enclosed. The Red King maintained that such exactions as these were not sacrilegious, inasmuch as the money so raised was to go to maintain wars against infidels and enemies of Christ. The pretext was specious, but rather transparent, for it was his brother who was to spend the money in the holy war, while he was to receive a most usurious interest for it, even taking nothing into account but the immediate revenue of Normandy.

Soon after receiving his 10,000*l.*, Robert departed joyfully for Palestine, flattering himself with a splendid futurity; and then William, indulging in the less fantastic prospect of near and solid advantages, sailed to the continent to take immediate possession of Normandy and its dependencies. He had long held many of their fortresses, his partisans among the nobility were numerous and powerful, and he was received by the Normans without opposition. But it was far otherwise with the people of Maine, who burst into a universal insurrection, and by rallying round Helie, Lord of La Flêche, a young and gallant adventurer, who had some claim to the country himself, gave Rufus much trouble, and obliged him to carry over an army from England more than once. About three years after Robert's departure the brave Helie was surprised in a wood with only seven knights in company, and made prisoner by one of the English king's officers. Rufus marched into Maine soon after at the head of a large force of horse; but the French king and the Count of Anjou interfering, he was induced to negotiate, and Helie obtained his liberty by delivering up the town of Mans. The people continued to dislike the sway of their new master, and the Lord of La Flêche, after offering his services, was unnecessarily irritated by William. In the following year (1100), as the Red King was hunting in the New Forest, a messenger from beyond sea arrived with intelligence that Helie had surprised the town of Mans, and was besieging the Norman garrison in the castle, being aided therein by the inhabitants, who had again recognised him as their lawful chief. In bravery, prompt decision, and rapidity of movement, William was little inferior to his father, the Conqueror. He instantly turned his horse's head, and set off for the nearest seaport. The nobles who were hunting with him reminded him that it was necessary to call out troops, and wait for them. "Not so," replied Rufus; "I shall see who will follow me; and, if I understand the temper of the youth of this kingdom, I shall have people enough." Without stopping or turning he reached the port, and embarked in the first vessel he found. It was blowing a gale of wind, and the sailors entreated him to have patience till the storm should abate. "Weigh anchor, hoist sail, and begone," cried Rufus; "did you ever hear of a king that was drowned?"* An old writer intimates that the mariners might have replied, "Yes, Pharaoh with all his host;" but they were probably not versed in Scripture, and made no such answer, but, obeying their orders, put to sea, and safely landed their royal passenger at Barfleur on the following day. The news of his landing sufficed to raise the siege of the castle of Mans; and Helie, thinking he must have come in force, dismissed his troops and took to flight. The Red King then barbarously ravaged the lands of his enemies; but being wounded while laying siege to an insignificant castle, he returned suddenly to England, which he was destined not to leave again.

William's lavish expenditure continued on the increase; but by his exactions and irregular way of dealing with church property, he still found means for gratifying his extravagance, and enjoyed abroad the reputation of being a rich as well as a powerful king. William, Earl of Poictiers and Duke of Guienne, caught the prevailing passion for the Crusades, and in order to be enabled to carry a respectable force to Palestine, he also offered to mortgage his dominions to the King of England. Rufus, as eager as ever for territorial aggrandisement, accepted the offer, and even began to raise the money. But the great creditor, whose demands are often as sudden as they are irresistible, closed this new account before it was well opened.

Popular superstition had long darkened the shades and solitudes of the New Forest, and peopled its glades with horrid spectres. The fiend himself, it was said and believed, had appeared there to the Normans, announcing the punishment he had in reserve for the Red King and his wicked counsellors. The accidents that happened in that chase, which had been so barbarously obtained, gave strength to the vulgar belief. In the month of May, Richard, an illegitimate son of Duke Robert, was killed while hunting in the forest by an arrow, reported to have been shot at random. This was the second time that the Conqueror's blood had been poured out there, and men said it would not be the last time. On the 1st of August following William lay at Malwood-

* Holinshed.—Speed.—The old authorities are Eadmer, Orderic, Matt. Paris, and W. Malmsb.

* Will. Malmsb.

keep, a hunting-seat in the forest,* with a goodly train of knights. A reconciliation had taken place between the two brothers, and the astucious Henry, who had been some time in England, was of the gay party. The circumstances of the story, as told by the monkish chroniclers, are sufficiently remarkable. At the dead of night the king was heard invoking the Blessed Virgin, a thing strange in him; and then he called aloud for lights in his chamber. His attendants ran at his call, and found him disturbed by a frightful vision, to prevent the return of which he ordered them to pass the rest of the night by his bedside, and divert him with pleasant talk. As he was dressing in the morning an artisan brought him six new arrows: he examined them, praised the workmanship, and keeping four for himself, gave the other two to Sir Walter Tyrrel, otherwise called, from his estates in France, Sir Walter de Poix, saying, as he presented them, "Good weapons are due to the sportsman that knows how to make a good use of them."* The tables were spread with an abundant collation, and the Red King ate more meat and drank even more wine than he was wont to do. His spirits rose to their highest pitch; his companions still passed the wine-cup, whilst the grooms and huntsmen prepared their horses and hounds for the chase; and all was boisterously gay in Malwood-keep, when a messenger arrived from Serlon, the Norman Abbot of St. Peter's, at Gloucester, to inform the king that one of his monks had dreamt a dream foreboding a sudden and awful death to him. "The man is a right monk," cried Rufus, "and to have a piece of money he dreameth such things. Give him, therefore, an hundred pence, and bid him dream of better fortune to our person." Then turning to Tyrrel, he said, "Do they think I am one of those fools that give up their pleasure or their business because an old woman happens to dream or sneeze? To horse, Walter de Poix!"

The king, with his brother Henry, William de Breteuil, and many other lords and knights, rode into the forest, where the company dispersed here and there, after the manner used in hunting; but Sir Walter, his especial favourite in these sports, remained constantly near the king, and their dogs hunted together. As the sun was sinking low in the west a hart came bounding by, between Rufus and his comrade, who stood concealed in the thickets. The king drew his bow, but the string broke, and the arrow took no effect.

* The Red King lies in Malwood-keep,
To drive the deer o'er lawn and steep,
He's bound him with the morn.
His steeds are swift, his hounds are good;
The like, in covert or high-wood,
Were never cheer'd with horn.
W. Stewart Rose.

"Malwood Castle, or Keep, seated upon an eminence, embosomed in wood, at a small distance from the village of Minestead, in the New Forest, was the residence of this prince when he met with the accident which terminated his life. No remains of it exist; but the circumference of a building is to be traced; and it yet gives its name to the walk in which it was situated.'—Notes to the "Red King."—This spirited and beautiful poem is published in the same volume with "Partenopex de Blois."

* Orderic. Vital.

Death of Rufus.—Burney.

Startled by the sound, the hart paused in his speed and looked on all sides, as if doubtful which way to turn. The king, keeping his attention on the quarry, raised his bridle-hand above his eyes, that he might see clear by shading them from the glare of the sun, which now shone almost horizontally through the glades of the forest; and at the same time, being unprovided with a second bow, he shouted, "Shoot, Walter!—shoot, in the devil's name!" * Tyrrel drew his bow,—the arrow departed, was glanced aside in its flight by an intervening tree, and struck William in the left breast, which was left exposed by his raised arm. The fork-head pierced his heart, and with one groan, and no word or prayer uttered, the Red King fell and expired. Sir Walter Tyrrel ran to his master's side, but, finding him dead, he remounted his horse, and, without informing any one of the catastrophe, galloped to the sea-coast, embarked for Normandy, whence he fled for sanctuary into the dominions of the French king, and soon after departed for the Holy Land. According to an old chronicler, the spot where Rufus fell had been the site of an Anglo-Saxon church which his father, the Conqueror, had pulled down and destroyed for the enlarging of his chase.* Late in the evening the royal corpse was found, alone, where it fell, by a poor charcoal-burner,† who put it, still bleeding, into his cart, and drove towards Winchester. At the earliest report of his death, his brother Henry flew to seize the royal treasury, and the knights and favourites who had been hunting in the forest dispersed in several directions to look after their interest, not one of them caring to render the last sad honours to their master. The next day the body, still in the charcoal-maker's cart, and defiled with blood and dirt, was carried to St. Swithin's, the cathedral church of Winchester. There, however, it was treated with proper respect, and buried in the centre of the cathedral choir, many persons looking on, but few grieving. A proof of the bad opinion which the people entertained of the deceased monarch is, that they interpreted the fall of a certain tower in the cathedral, which happened the following year, and covered his tomb with its ruins, into a sign of the displeasure of Heaven that he had received Christian burial.*

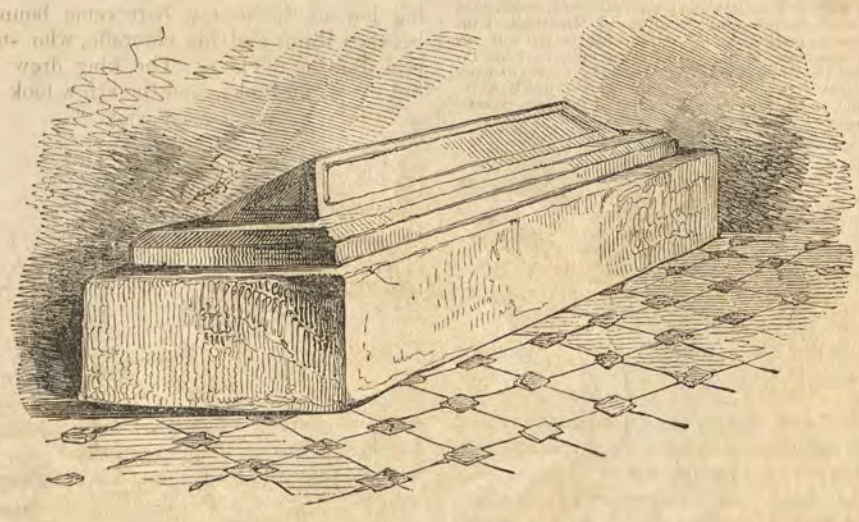
* Walter Hennyngforde, quoted in Grafton's Chronicle.

† "This man's name was Purkess. He is the ancestor of a very numerous tribe. Of his lineal descendants it is reported that, living on the same spot, they have constantly been proprietors of a horse and cart, but never attained to the possession of a team."—Notes to the "Red King."



TOMB OF RUFUS.

The second king of the Norman line reigned thirteen years all but a few weeks, and was full of health and vigour, and only forty years of age when he died. That he was shot by an arrow in the New Forest,—that his body was abandoned and then hastily interred,—are facts perfectly well authenticated; but some doubts may be entertained as to the precise circumstances attending his death, notwithstanding their being minutely related by writers who were living at the time, or who flourished in the course of the following century. Sir Walter Tyrrel afterwards swore, in France, that he did not shoot the arrow; but he was probably anxious to relieve himself from the odium of killing a king, even by accident. It is quite possible, indeed, that the event did not arise from chance, and that Tyrrel had no part in it. The remorseless ambition of Henry might have had recourse to murder, or the avenging shaft might have been sped by the desperate hand of some Englishman, tempted by a favourable opportunity and the traditions of the place. But the most charitable construction is, that the party were intoxicated with

* Dr. Milner, Hist. Winchest.

Stone, in the New Forest, marking the site of the Oak-tree against which the Arrow of Sir Walter Tyrrel is said to have glanced.

the wine they had drunk at Malwood-keep, and that, in the confusion consequent on drunkenness, the king was hit by a random arrow.

The Red King was never married; and his example is said to have induced all his young courtiers to prefer the licentious liberty of a single life. In describing his libertinism, the least heinous charge of the monkish historians is, that he respected not the virtue of other men's wives, and was "a most especial follower of lemmans." For the honour of human nature we hope the picture is overcharged; but there are proofs enough to convince us that but little order or decorum reigned in the court of Rufus. On the contrary, indeed, all writers agree in their accounts of the dissolute manners of his household and adherents. His rapacity is equally unquestionable; but this charge is partially alleviated by his taste and magnificence, which were beneficial to the nation. He did not spend all his money in his wars, his foreign schemes, his pleasures and debaucheries, but devoted large sums to the building of royal palaces, and to some works of great public utility.

Henry I.—Surnamed Beauclerk.

A.D. 1100. Henry was not unopposed in the first step he took to secure the crown. While he was imperiously demanding the keys of the royal treasury, and the officers in whose charge they were placed were hesitating whether they should deliver them or not, William de Breteuil, the royal treasurer, who had also been of the fatal hunting party, arrived with breathless speed from the forest, and opposed his demand. "You and I," said he to Henry, "ought to remember the faith we have pledged to your brother, Duke Robert; he has received our oath of homage, and, absent or present, he has a right to this money." Henry attempted to shake the fidelity of the treasurer with arguments,

GREAT SEAL OF HENRY I.

but William de Breteuil resolutely maintained that Robert was the lawful sovereign of England, to whom, and to no one else, the money in Winchester Castle belonged.* The altercation grew violent, and Henry, who felt he had no time to lose, drew his sword, and threatened immediate death to any that should oppose him. He was supported by some powerful barons who happened to be on the spot, or who had followed him from the forest, and whose favour he had secured beforehand. De Breteuil was left almost single in his honourable opposition, the domestics of the late king taking part against him; and Henry seized the money and crown-jewels before his eyes. Part of the money seems to have been distributed immediately among the barons and churchmen at Winchester; and the Saxon Chronicle says that "the witan who were then nigh at hand chose him to be king." He immediately gave the bishopric of Winchester to Henry Gifford, a most influential adherent, and then proceeded with all speed to London, where he made a skilful use of his treasures, and was proclaimed by an assembly of noblemen and prelates, no one challenging his title, but all acknowledging his consummate abilities and fitness for government. On Sunday, the 5th of August, only three days after the death of Rufus, standing before the altar in Westminster Abbey, he promised God and all the people to annul all the unrighteous acts that took place in his brother's time; and after this declaration, Maurice, the bishop of London, consecrated him king.† Anselm, the archbishop of Canterbury, who, according to ancient rule, should have performed the ceremony of the coronation, had been driven out of the kingdom some three years before; and the archbishopric of York had been left vacant for some time. A popular recommendation, which had, no doubt, great influence, was, that Henry was an Englishman, born in the country,* and after the Conquest; and some of his partisans set up this circumstance as being in itself a sufficient title to the crown. But he himself, in a charter of liberties issued on the following day, and diligently promulgated throughout the land, represented himself as being crowned "by the mercy of God, and by the common consent of the barons of the kingdom."

The claims of Duke Robert were not forgotten; but Henry, who "had aforehand trained the people to his humour and vein, in bringing them to think well of him," had also caused to be reported, as a certain fact, that Robert was already created king of Jerusalem by the Crusaders, and would never leave the Holy Land for an ordinary kingdom. Although the law of succession remained almost as loose as under the Saxon dynasty, and the crown of England was still, in form at least, an elective one, Henry, who, moreover, was bound by oaths to his elder brother Robert, seems himself to have been conscious of a want of validity or security in his title, and to have endeavoured to strengthen his throne by reforms of abuses and by large concessions to the nation. Such is almost invariably the course pursued by intrusive kings; and hence usurpations, though they may be productive of war and suffering, are not always to be considered as unmixed evils. The charter of liberties passed by Henry on his accession, as forming an important feature in our progressive law and government, will be treated of elsewhere. It will suffice for the course of this narrative to state, that he restored all the rights of the church, promised to require only moderate and just reliefs from his vassals, to exercise his powers in wardships and

* Malms. † Sax. Chron.

* Henry was born at Selby, in Yorkshire, A.D. 1070, in the fourth year of his father's reign as king of England.

marriages with equity and mildness, to redress all the grievances of the former reign, and to restore the laws of King Edward the Confessor, subject only to the amendments made in them by his father. "So general was the confidence in the restoration of the native institutions," says Sir J. Mackintosh, "that it induced a private compiler to draw up a summary of Saxon law, which is still extant under the title of the 'Laws of Henry the First,' probably as, in the writer's opinion, deriving their validity from his confirmation, and for the purpose of propping Henry's infirm title by resting it on the same basis with this reformation."*

Still further to conciliate his Anglo-Saxon subjects, and to secure them to his interests in case of a revolt on the part of his Norman barons, Henry, who on all necessary occasions boasted of his English birth, determined to espouse an English wife. This marriage is a most important historical event, being a step made towards that intermixture and fusion of the two races which destroyed, at a much earlier period than is generally imagined, the odious distinction between English and Normans. It is also exceedingly interesting in some of its details, and particularly those which have been transmitted by the pen of Eadmer,† who was living at the time, and who, as an Englishman himself, entertained a lively sympathy for the fortunes of the young princess. The lady of Henry's choice was, to use the words of the Saxon Chronicle, "Maud, daughter of Malcolm, king of Scots, and of Margaret, the good queen, the relation of King Edward, and of the right kingly kin of England." This descendant of the great Alfred had been sent from Scotland at a very early age, and committed to the care of her aunt Christina, Edgar Atheling's second sister, who was abbess of Wilton, or, as others say, of Rumsey, in Hampshire. As she grew up, several of the Norman captains aspired to the honour of her hand. She was asked in marriage by Alan, the lord of Richmond; but Alan died before he could receive any answer from the king. William de Garenne, earl of Surrey, was the next suitor, but the marriage was not allowed by Rufus, to whom, and not to the young lady or her relations, these several demands were made. A contemporary writer‡ says, he knows not why the marriage with the earl of Surrey did not take place; but the policy of forbidding a union between a powerful vassal and a princess of the ancient royal line is evident; and the Red King, like his father, held it as part of his prerogative to give or refuse the hands of his fair subjects. When proposals were made on the part of King Henry, the fair Saxon, not being dazzled with the prospect of sharing with a Norman the throne on which her ancestors had sat for centuries, showed a decided aversion to the match. But she was assailed by arguments and inducements difficult to resist. "Oh! most noble and fair among women," said her Saxon advisers, "if thou wilt, thou canst restore the ancient honour of England, and be a pledge of reconciliation and friendship; but if thou art obstinate in thy refusal, the enmity between the two races will be everlasting, and the shedding of human blood know no end."* When her slow consent was obtained, another impediment was raised by a strong Norman party, who neither liked to see an English woman raised to be their queen, nor the power of their king confirmed by means which would endear him to the native race, and render him more and more independent of the Normans. They asserted that Maude, who had been brought up from her infancy in a convent, was a nun, and that she had been seen wearing the veil, which made her for ever the spouse of Christ. Such an obstacle would have been insurmountable; and as there were some seeming grounds for the report, the celebration of the marriage was postponed, to the great joy of those who were opposed to it.†

Anselm, the archbishop of Canterbury, who had returned from Italy at the pressing invitation of the new king, was a zealous promoter of the marriage—for his soul was kind and benevolent, and he was interested in favour of the English people; but, when he heard the reports which were circulated, he declared that nothing could induce him to unite a nun to a carnal husband. The archbishop, however, determined to question the maiden herself; and Matilda, or Maude, in reply, denied she had ever taken the vows, or even worn the veil of her free will; and she offered to give full proof of this before all the prelates of England. A speech which Eadmer puts into her mouth is a curious specimen of *naïveté*, and a proof of the brutality of the Norman soldiers towards the females of the conquered race. "I must confess," she said, "that I have sometimes appeared veiled; but listen to the cause: in my first youth, when I was living under her care, my aunt, to save me, as she said, from the lust of the Normans, who attacked all females, was accustomed to throw a piece of black stuff over my head; and when I refused to cover myself with it she treated me very roughly. In her presence I wore that covering, but as soon as she was out of sight I threw it on the ground, and trampled it under my feet in childish anger." To solve this great difficulty, Anselm called a council of bishops, abbots, and monks, who met in the city of Rochester. Witnesses summoned before this council confirmed the truth of Matilda's words. Two archdeacons, who had been sent to the convent where the young lady was brought up, deposed that public report, and the testimony of the nuns, agreed with her declaration. At the moment when the council was to deliberate on its verdict the archbishop retired, to avoid any suspicion of biassing their decision. This decision, given una-

* Matt. Par. † Eadmer.

nimously, was: "We, the bishops, &c., are of opinion that the young lady is free, and can dispose of herself; and we have a precedent in a judgment rendered in a similar cause by the venerable Lanfranc, when the Saxon women, who had taken refuge in the convent out of fear of the soldiers of the great William, reclaimed and obtained their liberty." On Sunday, the 11th of November, the marriage was celebrated, and the queen was crowned with great pomp and solemnity. But so wisely cautious was the prelate, and so anxious to dissipate all suspicions and false reports, that before pronouncing the nuptial benediction, he mounted on a bench in front of the church-door, and showed to the assembled people the debate and decision of the ecclesiastical council. The Normans, who had opposed the union, now vented their spite in bitter raillcries, and in applying nicknames taken from Saxon ballads;—the king they called Godric, and the queen, Godiva. Henry dissembled his rage till a convenient moment, and in public laughed heartily at the insolent jests. Matilda, who had given her consent to the marriage with reluctance, and who found a most unfaithful husband, proved a "right loving and obedient wife." She was beautiful in person, and distinguished by a love of learning and great charity to the poor. Her elevation to the throne filled the hearts of the English with a momentary joy.

Another proceeding which greatly increased the new king's popularity with the English, and with all who entertained respect for virtue and decency, was his expulsion of his brother's minions. If half of the detestable vices attributed by the churchmen, their contemporaries, to these favourites, were really prevalent among them, they must have been a curse and an abomination to the land. Henry, however, had intimately associated with them all—his life had been as lewd and licentious as the Red King's; and the outward reformation and the measures he now adopted seem to have been, at the very least, dictated as much by policy as by any virtuous conviction. He felt it expedient to yield a homage to the better feelings of the nation.

It was scarcely possible that Ralf Flambard, the obnoxious minister of the late king, should escape in this general purgation. Ralf's great crime, which was his rapacity, had probably put him in possession of wealth, which Henry stood in need of; and the outcries of the people against the fallen minister urged and seemed to justify his being despoiled and otherwise punished. The bishop of Durham—for such was the ecclesiastical promotion Ralf had attained under Rufus—was thrown into the Tower, where he lived most luxuriously, and captivated the affections of his keepers by his conviviality, generosity, and wit. In the February following Henry's coronation a good rope was conveyed to the bishop hid in the bottom of a huge wine flagon. His guards drank of the wine until their senses forsook them; and then Ralf, under favour of the night, and by means of the rope, descended from his prison window and escaped. Some friends in attendance put him on board ship, and the active bishop made sail for Normandy, to see what fortune would offer him as the servant of Robert Courthose.

When Henry caused the report to be circulated that Robert had obtained the crown of Jerusalem and thought not of returning to England, he knew right well that another than he had been elected sovereign in the Holy Land, and that his brother was actually in Europe, and on his way back to Normandy, in which country he arrived within a month or six weeks after the death of Rufus. The improvident Duke had greatly distinguished himself in the conquest of Palestine and the taking of Jerusalem, performing prodigies of valour, which were only surpassed, in later times, by Richard Cœur de Lion, and even showing, it is said, great eloquence when called upon to speak in the councils of the crusaders, and admirable military talents when commanding in the field. He was also pre-eminent among the crusading princes and chiefs from his powerful family connexions and from the host of men he led to the holy war; for besides his subjects of Normandy, Maine, and Brittany, many English and some Irish followed his standard thither, and would obey the direct orders of none but him. "Yea, England," says old Fuller, quaintly, "the Pope's pack-horse in that age, which seldom rested in the stable when there was any work to be done, sent many brave men under Robert Duke of Normandy; as Beauchamp, and others whose names are lost. Neither surely did the Irishmen's feet stick in their bogs, though we find no particular mention of their achievements."* Though respected in proportion to his power, and valued for the good qualities he possessed, the crusaders never thought seriously of electing so imprudent a prince to the difficult post of securing and governing the conquests they had made; nor does Robert appear ever to have fixed his eye on the throne of Jerusalem, which, by universal consent, fell to Godfrey of Bouillon, a man "born for command," and as wise and prudent as a statesman as he was gallant and fearless as a knight.† Soon after the capture of Jerusalem, which happened on the 15th of July, 1099, somewhat more than a year before the death of the English king in the New Forest, Duke Robert left the Holy Land covered with holy laurels, and crossed the Mediterranean to Brundusium, the nearest port of Italy, intending to travel homeward by land through that beautiful and luxurious country. The Norman lance, as we have already mentioned, had won the fairest portion of Southern Italy some years before

* Hist. Holy War. Among the independent lords who accompanied Robert were, Eustace, Earl of Boulogne, Stephen, Earl of Aubemale or Albermarle, and his half-uncle, the notorious Odo, Bishop of Bayeux, and Earl of Kent.

† Veramente è costui nato all' impero,
Si del regnar, del commandar sa l'arti:

the conquest of England; and as Duke Robert advanced into the land, he was everywhere met by Norman barons and nobles of Norman descent, who ruled even more absolutely in Apulia than did their brethren in our island. At every feudal castle the Duke was hailed and welcomed as a countryman, a friend, a hero, a crusader returning with victory, whom it was honourable to honour; and so much was their hospitality to the taste of that thoughtless prince that he lingered long, and well pleased on his way. Of all these noble hosts was none more noble, or more powerful than William Count of Conversano: he was the son of Geoffrey, who was nephew of Robert Guiscard, the founder of the Norman dynasty in Naples: his vast possessions lay along the shores of the Adriatic, from Otranto to Bari, and extended far in-land in the direction of Lucania and the other sea. He was, in short, the most powerful lord in Lower Apulia. His castle, which stood on an eminence surrounded by olive groves, at a short distance from the Adriatic, had many attractions for the pleasure-loving and susceptible son of the Conqueror. There were minstrels and jongleurs; there were fine horses and hounds, and hawks, in almost royal abundance; and the vast plains of Apulia, with the forests and mountains that encompass them, offered a variety of the finest sport. But there was an attraction even greater than all these in the person of a beautiful maiden, the young Sibylla, the daughter of his host the Count of Conversano. Robert became enamoured, and such a suitor, who, besides his other merits, was sovereign Duke of Normandy, with a prospect of possessing the royal crown of England, was not likely to be rejected. Robert received the hand of Sibylla, who is painted as being as good as she was fair, together with a large sum of money as her dowry. Happy in the present, careless of the future, and little thinking that a man so young as his brother the Red King would die, he lingered several months in Apulia, and finally travelled thence without any eagerness or speed, and at the critical moment when the English throne fell vacant his friends hardly knew when they might expect him. On his arrival, however, in Normandy, he appears to have been received with great joy by the people, and to have obtained peaceful possession of the whole of the country with the exception of the fortresses surrendered to Rufus, and which were now held for Henry. He made no secret of his intention of prosecuting his claim on England; but here again he lost time and threw away his last remaining chance. He was proud of showing his beautiful bride to the Normans, and, with his usual imprudence, he spent her fortune in feasting and pageantry. Ralph Flambard was the first to wake him from this splendid but evanescent dream, and at the earnest suggestion of the fugitive bishop-minister he prepared for immediate war, knowing it was vain to plead to Henry his priority of birth, his treaty with Rufus, or the oaths which Henry himself had taken to him. It may be doubted, seeing the character of the factious nobles whether, had Robert succeeded in his enterprise, his indolence, easy nature, and incurable imprudence would not have proved as great a curse to England as the harshness and tyranny of any of the Norman line, and whether the nation would not have made a retrograde step instead of advancing, as it certainly did somewhat, under his crafty and cruel, but politic rival Henry.

When his ban of war was proclaimed, Robert's Norman vassals showed the utmost readiness to fight under a prince who had won laurels in the Holy Land, and the Norman barons expressed the same discontent at the separation of the duchy and kingdom which had appeared on the accession of William Rufus. If the nobles had been unanimous in their preference of Robert as sovereign of the country, on either side the Channel where they had domains, the dispute about the English throne must have been settled in his favour; but they were divided, and many preferred Henry (as they had formerly done Rufus) to Robert. The friends of the latter, however, were neither few nor powerless: several of high rank crossed the Channel from England to urge him to recover the title which belonged to him in virtue of the agreement formerly concluded between him and the Red King; and Robert de Belesme, Earl of Shrewsbury and Arundel, William de la Warrenne, Earl of Surrey, Arnulf de Montgomery, Walter Gifford, Robert de Pontefract, Robert de Mallet, Yvo de Grentmesnil, and many others of the principal nobility, promised on his landing to join him with all their forces. Henry, knowing the disaffection of the barons, whose secrets were betrayed to him, began to tremble on the throne he had so recently acquired. These fears of the Normans threw him more than ever on the support of the English people, whom he now called his friends, his faithful vassals, his countrymen,—the best and bravest of men,—though his brother, he insidiously added, treated them with scorn, and called them cowards and gluttons.* At the same time he paid diligent court to Archbishop Anselm, who, by the sanctity of his character and his undeniable virtues and abilities, exercised a great influence in the nation. As Anselm was an Italian and a churchman, it may be believed that he gladly obtained the large concessions made to the Pope by the trembling king; but from the earnestness with which he embraced the cause of Henry we are also entitled to assume that he saw good and laudable reasons for supporting the existing settlement of the crown, and the averting of a civil war is no questionable merit. If anxious to extend the privileges of the church, he was scarcely less so to establish the liberties of the people; and to him, as the representative of the nation, Henry swore to maintain the charter he had granted at his coronation, and faithfully to fulfil all his engagements.

The effect of all this was, that the bishops, the common soldiers, and the native English, with a curious exception, stood firmly on the side of

* Matt. Paris.

Henry, who could also count among the Norman nobility Robert de Mellent, his chief minister, the Earl of Warwick, Roger Bigod, Richard de Redvers, and Robert Fitz-Hamon, all powerful barons, as his unchangeable adherents. The exception against him, on the part of the native English, was among the sailors, who, affected by Robert's fame, and partly won over by the fugitive Bishop of Durham, deserted with the greater part of a fleet which had been hastily equipped to intercept the Duke on his passage, or oppose his landing. Robert sailed from Normandy in these very ships, and, while Henry was expecting him at Pevensey, on the Sussex coast, reached Portsmouth, and there landed. Before the two armies could meet some of the less violent of the Normans from both parties had interviews, and agreed pretty well on the necessity of putting an end to a quarrel among countrymen and friends. When the hostile forces fronted each other, there was a wavering among his Normans; but the English continued faithful to Henry, and Anselm threatened the invaders with excommunication. To the surprise of most men, the duke's great expedition ended in a hurried peace and a seemingly affectionate reconciliation between the two rivals, after which the credulous Robert, who indeed seemed destined to be the dupe of his crafty brothers, returned peaceably to the continent, renouncing all claim to England, and having obtained a yearly payment of 3000 marks, and the cession to him of all the castles which Henry possessed in Normandy. It was also stipulated, that the adherents of each should be fully pardoned, and restored to all their possessions, whether in Normandy or in England; and that neither Robert nor Henry should thenceforward encourage, receive, or protect the enemies of the other. There was another clause added, which, even without counting how much older he was than Henry, was not worth to Robert the piece of parchment it was written upon: —it imported that if either of the brothers died without legitimate issue the survivor should be the heir to his dominions. To this clause, as to its counterpart in the former treaty signed at Caen, between Robert and Rufus, twenty-four barons, twelve on each side, gave the solemn mockery of their oaths.

Robert was scarcely returned to Normandy when Henry began to take measures against the barons, his partisans, whom he had promised to pardon; and his craft and cunning enabled him to proceed for some time without committing any manifest violation of the treaty. He appointed spies to watch them in their castles, and artfully sowing dissensions among them and provoking them to breaches of the law, he easily obtained from the habitual violence of these unpopular chiefs a plausible pretence for his prosecutions. He summoned Robert de Belesme, Earl of Shrewsbury, to answer to an indictment containing forty-five serious charges. De Belesme appeared, and, according to custom, demanded that he might go freely to consult with his friends and arrange his defence; but he was no sooner out of the court than he mounted his horse and galloped off to one of his strong castles. The king summoned him to appear within a given time under pain of outlawry. The Earl responded to the summons by calling his vassals around him and preparing for open war. This was meeting the wishes of the king, who took the field with an army consisting in good part of English infantry, well disposed to do his will, and delighted at the prospect of punishing one of their many oppressors. He was detained several weeks by the siege of the castle of Arundel, the garrison of which finally capitulated, and then, in part, escaped to join their Earl de Belesme, who, in the mean time, had strongly fortified Bridgenorth, near the Welsh frontiers, and strengthened himself in the citadel of Shrewsbury. During the siege of Bridgenorth the Normans in the king's service showed they were averse to proceeding to extremities against one of the noblest of their countrymen, and some of the earls and barons endeavoured to put an end to the war by effecting a reconcilement between Robert de Belesme and the sovereign. "For," says a cotemporary writer, "they thought that the victory of the king over Earl Robert would enable him to make them all bend to his will."* They demanded a conference, and an assembly was held in a plain near the royal camp. A body of English infantry posted on a hill close by, who knew what was in agitation among the Norman chiefs, cried out, "Do not trust in them, King Henry; they want to lay a snare for you. We are here; we will assist you and make the assault. Grant no peace to the traitor until you have him in your hands alive or dead!"† The attempt at reconciliation failed,—the siege was pressed and Bridgenorth fell. The country between Bridgenorth and Shrewsbury, where the Earl made his last stand, was covered with thick wood, and infested by his scouts and archers. The English infantry cleared the wood of the enemy, and cut a convenient road for the king to the very walls of Shrewsbury, where de Belesme, reduced to despair, soon capitulated. He lost all his vast estates in England, but was permitted to retire into Normandy on taking an oath he would never return to the kingdom without Henry's permission. His ruin involved that of his two brothers, Arnulf de Montgomery and Roger, Earl of Lancaster, and as the king's hands became strengthened, the prosecution and condemnation of all the barons who had been favourable to Robert followed. One by one nearly all the great nobles, the sons of the men who had achieved the conquest of England, were driven out of the land as traitors and outlaws, and their estates and honours were given to "new men," to the obscure followers of the new court.

So scrupulous was Duke Robert in observing the treaty, that on the first notice of De Belesme's rebellion he ravaged the Norman estates of that nobleman; considering himself, in spite of former ties of friendship, as bound so to do by the clause which stipulated that neither brother should encou-

* Orderic.] † Id.

rage the enemies of the other. He was soon, however, made sensible that the real crime of all the outlaws, in Henry's eyes, was the preference they had given to him; and following one of those generous impulses to which his romantic nature was prone, he came suddenly over to England, and put himself completely in the power of Henry, to intercede in favour of the unfortunate barons. The crafty king received him with smiles and brotherly embraces, and then placed spies over him to watch all his motions. Robert, who had demanded no hostages, soon found he was a prisoner, and was glad to purchase his liberty by renouncing his annuity of three thousand marks. He then returned to Normandy, and, in self-defence, renewed his friendship with the barons exiled from England, accepting among others the services of De Belesme, who was still a powerful lord, as he possessed above thirty castles of different kinds in Normandy. Henry now most impudently pretended that Robert was the aggressor, and declared the peace between them was for ever at an end. The simple truth was, that Robert was completely at his mercy, and he had resolved to unite the duchy to his kingdom. Normandy, indeed, was in a deplorable state, and Robert, it must be said, had given, and continued to give, manifold proofs of his inability to manage a factious and intriguing nobility, or to govern any state as states were then constituted. He was, indeed, "too trusting and merciful" for his age; and his generous virtues were more fatal to him than the vices or defects which stained his moral character.* He had, however, relapsed into his old irregularities after losing the beautiful Sibylla, who died in 1102, leaving an infant son, the only issue of their brief marriage. His court was again thronged with vagabond jongleurs, loose women, and rapacious favourites, who plundered him of his very attire,—at least this sovereign prince is represented as lying in bed at times from want of proper clothes to put on when he should rise. A much more serious evil for the country was, that his pettiest barons were suffered to wage war on each other and inflict all kinds of wrong and insult on the people. When Henry first raised the mask he declared himself the protector of Normandy against the bad government of his brother; and there were many, as well nobles as of the commonalty, who were glad to consider him in that light. He called on Robert to cede the duchy for a sum of money or an annual pension. "You have the title of chief," said he; "but in reality you are no longer a chief, seeing that the vassals who ought to obey you set you at nought."† The duke indignantly rejected the proposal; on which the king crossed the seas with an army, and, "by large distributions of money carried out of England," won many new partisans, and got possession of many of the fortresses of Normandy. The duke, on the other hand, had now nothing to give to any one, for, in his thoughtless generosity and extravagance, he had squandered everything on his return from Italy; yet still some brave men rallied around him out of affection to his person, or in dread and hatred of his brother, and Henry found it impossible to complete his ruin in this campaign.

In the following year (1106) the king re-appeared in Normandy with a more formidable army and with still more money, to raise which he had cruelly and arbitrarily distressed his English subjects; for by this time his charter had become worthless, and he had broken nearly every promise he made at his coronation. About the end of July he laid siege to Tenchebray, an important place, the garrison of which, incorruptible by his gold, made a faithful and gallant resistance. Robert, when informed that his friends were hard pressed, promised to march to their relief, ensue what might, and on the appointed day, most true to his word, as was usual with him in such matters, he appeared before the walls of Tenchebray, where Henry had concentrated his whole army. As a soldier Robert was far superior to his brother, but his forces were numerically inferior, and there was treachery in the camp. As brave, however, as when he fought the Paynim and mounted the breach in the Holy City, he fell upon the king's army, threw the English infantry into disorder, and had nearly won the victory, when De Belesme basely fled with a strong division of his forces, and left him to inevitable defeat; for a panic spread among the troops that remained, and all men thought they were betrayed. After a last and most brilliant display of his valour as a soldier, and his conduct as a commander, the duke was taken prisoner, with four hundred of his knights. "This battle," observes old John Speed, "was fought, and Normandy won, upon Saturday, being the vigil of St. Michael, even the same day forty years that William the Bastard set foot on England's shore for his conquest; God so disposing it (saith Malmsbury) that Normandy should be subjected to England that very day, wherein England was subdued to Normandy."

The fate of the captives made at Tenchebray, or taken after that battle, or who voluntarily surrendered, was various: some received a free pardon, some were allowed to be ransomed; and a few, among whom were the Earl of Mortaigne and Robert de Stuteville, were condemned to perpetual imprisonment. The ex-earl of Shrewsbury, the false De Belesme, was gratified with a new grant of most of his estates in Normandy; and the ex-bishop-minister Ralph Flambard, who had been moving in all these contentions, obtained the restoration of his English see, by delivering up the town and castle of Lisieux to King Henry. A remarkable incident in the victory of Tenchebray is, that the royal Saxon, Edgar Atheling, was among the prisoners. Duke Robert had on many occasions treated him with great kindness and liberality; and, as in some of their qualities the two princes resembled each other, there seems to have been a lasting sympathy and affection between

* William of Malmsbury says, "He forgot and forgave too much."
† Orderic.

them. According to some accounts Edgar had followed Robert to the Holy Land;* but this is at the least doubtful, and the Saxon Chronicle represents him as having joined the duke only a short time before the battle of Tenchebray, where he charged with the Norman chivalry. This was his last public appearance. He was sent over to England, where, to show the Norman king's contempt of him, he was allowed to go at large. At the intercession of his niece, the Queen Maud, Henry granted him a trifling pension; and this survivor of so many changes and sanguinary revolutions passed the rest of his life in an obscure but tranquil solitude in the country. So perfect was the oblivion into which he fell, that not one of the chroniclers mentions the place of his residence or records when or how he died. The fate of his friend Duke Robert, who had much less apathy, was infinitely more galling from the beginning, and his captivity was soon accompanied with other atrocities. He was committed a prisoner for life to one of his brother's castles. At first his keepers, appointing a proper guard, allowed him to take air and exercise in the neighbouring woods and fields. One day he seized a horse, and breaking from his guard, did his best to escape; but he was presently pursued, and taken in a morass, wherein his horse had stuck fast. Upon hearing of this attempt the king not only commanded "a greater restraint and harder durance," but ordered that his sight should be destroyed, in order to render him incapable of such enterprises, and unapt to all royal or martial duties for the future. This detestable order was executed by a method which had become horribly common in Italy* during these ages, and which was not unknown in other countries on the continent. A basin of copper or iron, made red-hot, was held close over the victim's eyes till the organs of sight were scared and destroyed. The wretched prince lived twenty-eight years after this, and died in Cardiff Castle in 1135, a few months before his brother Henry. He was nearly eighty years old, and had survived all the chiefs of name who rescued Jerusalem from the Saracens. Matthew of Paris tells a touching anecdote of his captivity. One day, when some new dresses were brought to him from the king, in examining them by his touch he found that one of the garments was torn or rent in the seam: the people told him that the king had tried it on and found it too tight for him. Then the prisoner threw them all far from him, and

* In 1086, the last year of the Conqueror's reign, Edgar Atheling obtained permission to conduct two hundred knights to Apulia, and thence to Palestine; but we are not informed what progress he made in this journey, and Duke Robert did not set out for the Holy Land until 1096, or ten years after.

* The punishment was usually applied to captive princes, fallen ministers, and personages of the highest rank and political influence. The Italians had even a verb to express it—*Abbacinare*, from *bacino*, a basin. "L'abbacinare è il medesimo che l'accecare; e perchè si faceva con un bacino rovente, che avvicinato agli occhi tenuti aperti per forza, concentrandosi il calore struggeva que' panicelli, e risecava l'umidità, che, come un' ava è intorno alla pupilla, e la ricopriva di una cotal nuvola, che gli toglieva la vista, si aveva preso questo nome d'abbacinare." Such is the formal explanation of the horrid verb in the Dictionary Della Crusca.

CARDIFF CASTLE, as it appeared in 1775.

exclaimed, "How, then, my brother, or rather my traitor, that craven clerk who has deprived me of my all, imprisoned me, blinded me, now holds me at so mean a rate—I, who had so much honour and renown, that he makes me alms of his old clothes, as if I were his valet." It seems to have been an established custom for kings to give dresses to their state prisoners at certain festivals in the year; and it is related of Fitz-Osborn that he lost his only chance of enlargement by treating a suit sent him by the Conqueror with disrespect.

As another trait of manners we may mention here, that Duke Robert was made prisoner at Tenchebray by Galdric, King Henry's chaplain, who was promoted to the bishopric of Llandaff for this clerical piece of service. This martial prelate's end was, however, in keeping with the circumstances of his promotion; for, having exasperated the people of Llandaff with his tyranny and violence, they set upon him in a field and killed him, with five of his canons.

In getting possession of Robert's person Henry became master of all Normandy. Rouen, the capital, submitted to the conqueror, and Falaise surrendered after a short resistance. At the latter place William, the only son of Sibylla and Duke Robert, fell into his hands. When the child, who was then only five years old, was brought into the presence of his uncle, he sobbed and cried for mercy. It could not escape the king's far-reaching calculations that this boy's legitimate claims might cause him future trouble; but Henry, as if making a violent effort to rid himself of evil thoughts, suddenly commanded that he should be removed from him, and given in custody to Helie de St. Saen, a Norman noble, on whom, though he had married an illegitimate daughter of Duke Robert, he thought he could rely. He soon, however, repented of this arrangement, and sent a force to surprise the castle of St. Saen, and secure the person of young William. Helie fled with his pupil, and they were both honourably received at all the neighbouring courts, where the beauty, the innocence, the early misfortunes, and claims of the boy, gained him many protectors. The most powerful of these friends were Louis the Sixth, commonly called *Le Gros*, and Fulk, Earl of Anjou, who were reasonably apprehensive of the increasing power of his uncle on the continent. As William Fitz-Robert, as he was called, grew up, and gave good promise of being a valiant prince, they espoused his cause more decidedly, Louis engaging to grant him the investiture of Normandy, and Fulk to give him his daughter Sibylla in marriage as soon as he should be of proper age. Before that period arrived circumstances occurred (A.D. 1113) that hurried them into hostilities, and the Earl of Flanders having been induced to sanction, if not to join their league, Henry was attacked at every point along the frontiers of Normandy. He lost towns and castles, and was alarmed at the same time by a report, true or false, that some friends of Duke Robert had formed a plot against his life. So great was his alarm, that for a long time he never slept without having a sword and buckler by his bed-side. When the war had lasted two years Henry put an end to it by a skilful treaty, in which he regained whatever he had lost in Normandy, and in which the interests of William Fitz-Robert were overlooked. These advantages were obtained by giving the estates and honours of the faithful Helie de St. Saen to Fulk, Earl of Anjou, and by stipulating a marriage between his only son, Prince William of England, and Matilda, another daughter of that earl. The previous contract between Fitz-Robert and Sibylla was broken off, and the Earl of Anjou agreed to give no more aid or countenance to that young prince.

These arrangements, so advantageous for Henry, were not made without great sacrifices of money on the part of the English people; and some years before they were concluded the nation was made to bear another burden. By the feudal customs the king was entitled to levy a tax for the marrying of his eldest daughter; and (A.D. 1110) Henry affianced the Princess Matilda, a child only eight years old, to Henry V., Emperor of Germany. The high nominal rank of the party, and the general poverty of the German emperors in those days, would alike call for a large dowry; and Henry V. drove a hard bargain with his brother (and to-be father-in-law) of England. The marriage portion seems to have been principally raised by a tax laid upon land at the rate of three shillings per hide; and the contemporary histories abound in complaints of the harsh manner in which instant payment was exacted. The stipulated sum was at length placed in the hands of the emperor's ambassadors, who conducted the young lady into Germany, where she was to be educated. If the English people suffered, they were regaled by a fine spectacle; for it is said that never was sight seen more splendid than Matilda's embarkation. The graver of the impressions, however, remained, and it was remembered to her disadvantage, many years after, how dear her espousals had cost the nation.

About this time Henry checked some incursions of the Welsh, the only wars waged in the interior of England during his reign, and, causing a strong army to follow them into their fastnesses, he gained several advantages over the mountaineers. He despaired, however, of reducing them to his obedience, and was fain to content himself with building a few castles a little in advance of those erected by the Conqueror and the Red King. He also collected a number of Flemings who had been driven into England by the misfortunes of their own country, and gave them the town of Haverfordwest, with the district of Ross, in Pembrokeshire. They were a brave and industrious people, skilled in manufacturing woollen cloths; and, increasing in wealth and numbers, they maintained themselves in their advanced post, in spite of the long efforts of the Welsh to drive them from it. But a subject which occupied the mind of the English king much more than the con-

quest of Wales was the securing the succession of all his dominions to his only legitimate son William, to whom he confidently and proudly looked as to one who was to perpetuate his lineage and power. Having already made all the barons and prelates of Normandy swear fealty and do homage to the boy, he exacted the same oaths in England at a great council of all the bishops, earls, and barons of the kingdom, held at Salisbury; and being still pursued by the dread of the growing popularity on the continent, and the just claims, of his nephew Fitz-Robert, he artfully laboured to get him into his power, making use, among other means, of the most enticing promises, — such as the immediate possession of three great earldoms in England. But that prince would never trust the gaoler of his father; and his cause was again supported by powerful friends, whose apprehensions were anew excited by the ambition of the English king.

(A.D. 1118.) At a moment when the most formidable confederacy that ever threatened him was forming on the continent, Henry lost his excellent consort, Maud the Good, who must indeed have "died with the sad reflection that she had sacrificed herself for her race in vain;" * and in about a month after he suffered a loss, which he probably felt much more, in the death of the Earl of Mellent, the ablest instrument of his ambition, the most skilful of all his ministers, who had so managed his foreign politics as to obtain the reputation of being the greatest statesman in Europe.

Henry's want of good faith had hurried on the storm which now burst upon him. He had secretly assisted his nephew Theobald,† Earl of Blois, in a revolt against his feudal superior and liege lord, the French king,—he had broken off the match agreed upon between his son William and the Earl of Anjou's daughter Matilda,—and he had belied many of the promises made to the Norman barons in his hour of need. The league that was formed against him, therefore, included many of his own disaffected Norman subjects, Louis of France, Fulk of Anjou, and Baldwin, Earl of Flanders,— the last-mentioned having fewer interested motives, and a purer affection for the gallant son of Duke Robert, than any of the others. The beginning of the war was altogether unfavourable to the allies, and King Louis, at one time, was forced to beg a suspension of hostilities. Then fortune veered, and King Henry lost ground; but, after a succession of reverses, his better star prevailed, and he was made happy by the death of Baldwin, Earl of Flanders, the soul of the confederacy, who died of a wound received at the siege of Eu. Being thus relieved from one of his formidable enemies, he proceeded to detach another by means as prevalent as sword, or lance, or arrow-shot. He sent a large sum of money to the venal Earl of Anjou, and agreed that the marriage between his son and the earl's daughter should be solemnized forthwith. Fulk took the bribe, and, abandoning his allies, went to prepare for the wedding. At the same time Henry gained over most of the disaffected Norman barons with rich presents or new promises; and after two more years of a war of petty sieges and of skirmishes scarcely deserving the name of battles, the French king saw himself deserted by all his allies. As before, the real sufferers in these campaigns were the people of Normandy and the neighbouring countries, whose lands were wasted and houses burned, and the people of England, who were taxed and harried to furnish the money for Henry. As for the chief warriors themselves, what with the impenetrable armour in which they now encased themselves, and a system of ransoming one another, and holding all knights, on whatever side they fought, as forming part of a brotherhood, every member of which, except in certain predicaments, was to be treated with respect, they suffered little more than if they had been engaged in jousts and tournaments. The engagement which closed this war, and which was more decisive than any fought during the course of it, is an amusing specimen of these knightly encounters.

On the 20th of August, A.D. 1119, King Louis, with four hundred knights, and King Henry, with five hundred knights, met, more by accident than by any design on either side, in the vicinity of the town of Noyon. Vizors were lowered, trumpets sounded, lances couched, and a brilliant charge made by the French chivalry headed by Fitz-Robert, or, as he was now generally called, "William of Normandy." This young prince broke through Henry's first rank, and penetrated to his uncle, who was struck twice on the head by William Crispin, Count of Evreux, a valiant knight, but, as the king wore a steel helmet of the best quality, he received little injury. After a gallant contest the French were defeated, leaving the royal standard and one hundred and forty knights in the hands of the victors. When the dead were counted they were found to amount to *three* knights! The king of France and young William of Normandy had their horses killed under them, but they escaped on foot. This boasted battle, which deserves to be remembered, was called the battle of Brenville. The French excused their overthrow by saying that King Henry set upon King Louis "when he was not *aware*, and his knights were all out of order and array;" adding, also, "that King Henry had a far greater number than the French king had." The Anglo-Normans or English (for the latter designation was already common) maintained that the victory had been won "in the open field royally;" but their superiority in number seems unquestionable. The battle was followed by a display of chivalrous courtesies. Henry sent King Louis a war-horse splendidly caparisoned, and his son made presents to William of Normandy: the prisoners were hospitably entertained, and dismissed on the payment of proper knightly ransoms. All this, though it only included

* Mackintosh, Hist. Eng.

† Elder brother of Stephen, who seized the English crown on Henry's death.

the higher classes, was an immense improvement on the savage practices of earlier times; but the civilization of chivalry was at all times somewhat superficial and uncertain in its operation, and during this very war atrocities were committed which make us shudder. Henry had married Juliana, one of his illegitimate children, to Eustace of Breteuil, of whose fidelity he afterwards doubted. He exacted as hostages two children, the daughters of Juliana and Eustace, and, as a pledge on his own part, ordered Harenc, one of his officers, to place his son in the hands of Eustace. In a moment of rage the brutal lord of Evreux tore out the eyes of the son of Harenc, and sent him back to his father. Harenc demanded justice, and Henry coolly told him he might retaliate on the daughters of Eustace and Juliana, the king's own grandchildren; and this the barbarian did forthwith, by putting out their eyes and cutting off their noses. In this horrid wreck of the strongest affections and feelings of human nature, Juliana attempted the life of her own father, by discharging an arrow at his breast with her own hands.*

Soon after the battle of Brenville an end was put to the war, now only maintained on one side by Louis, through the praiseworthy mediation of the Pope,† who, however, laboured in vain to procure a mitigation of the severity exercised on Duke Robert, and a proper settlement for his son William. By this treaty of peace Henry was to preserve undisturbed and unquestioned possession of Normandy; and his pride was saved by Louis consenting to receive the homage due to him for the duchy from the son instead of the father. This son, who was in his eighteenth year, had received the oaths of the Norman nobles, as also the hand of his bride, a child only twelve years old, whose father, Fulk of Anjou, had given her a considerable dower. King Henry, elated by success, now resolved to return triumphantly to England. The place of embarkation was Barfleur, where Rufus had landed after his stormy passage and impious daring of the elements.‡ The double retinue of the king and prince royal was most numerous, and some delay was caused by the providing of accommodation and means of transport for so many noble personages; among whom were counted we scarcely know how many illegitimate children and mistresses of the king. On the 25th of November (A.D. 1120), however, all was ready, and the sails were joyously bent as for a short and pleasant voyage. Thomas Fitz-Stephen, a mariner of some repute, presented himself to the king, and tendering a golden mark, said,—"Stephen, son of Evrard, my father, served yours all his life by sea, and he it was who steered the ship in which your father sailed for the conquest of England. Sire King, I beg you to grant me the same office in fief: I have a vessel called the *Blanche-Nef*, well equipped, and manned with fifty skilful mariners." The king replied that he had already chosen a vessel for himself, but, that in order to accede to the prayer of Fitz-Stephen, he would confide to his care the prince, with his companions and attendants. Henry then embarked, and setting sail in the afternoon with a favourable and gentle wind from the south, reached the English coast in safety on the following morning. The prince was accompanied in the Blanche-Nef, or White Ship, by his half-brother Richard, his half-sister the Lady Marie,* Countess of Perche, Richard earl of Chester, with his wife, who was the king's niece, her brother, the prince's governor, with a host of gay young nobles, both of Normandy and of England, one hundred and forty in number, eighteen being ladies of the first rank; all these and their retinues amounting, with the crew, to about three hundred persons. On such occasions it was usual to regale the mariners with a little wine, but the prince and the young men with him imprudently ordered three whole casks of wine to be distributed among the men, who "drank out their wits and reason." The captain had a sailor's pride in the speed of his craft and the qualities of his crew, and, though hours passed away, he promised to overtake every ship that had sailed before him. The prince certainly did not press his departure, for he spent some hours on deck in feasting and dancing with his company. A few prudent persons quitted the disorderly vessel, and went on shore. Night had set in before the Blanche-Nef started from her moorings, but it was a bright moon-light, and the wind, though it had freshened somewhat, was still fair and gentle. Fitz-Stephen, proud of his charge, held the helm; every sail was set, and, still to increase the speed, the fifty sturdy mariners, encouraged by their boyish passengers, plied the oar with all their vigour. As they proceeded coastwise they got engaged among some rocks at a spot called *Ras de Catte* (now Ras de Catteville), and the White Ship struck on one of these with such violence on her larboard side, that several planks were started, and she instantly began to fill. A cry of alarm and horror was raised at once by three hundred voices, and was heard on board some of the king's ships that had gained the high sea, but nobody there suspected the cause. Fitz-Stephen lowered a boat, and putting the prince with some of his companions in it, advised them to row for the shore, and save themselves. This would not have been difficult, for the sea was smooth, and the coast at no great distance; but his sister Marie had been left behind in the ship, and her shrieks touched the heart of the prince,—the best or most generous deed of whose life seems to have been his last. He ordered the boat to be put back to take her in; but such

† Calixtus II. He was related by marriage to King Henry, and personally visited that sovereign, who, among other signal falsehoods, assured him that his brother Robert was not a prisoner, but entertained in a sumptuous manner in one of the royal castles, where he enjoyed as much liberty and amusement as he desired.

‡ See ante, p. 401. Most of the old historians are of opinion that the drowning of the nephew was a judgment provoked by the presumption of the uncle.

* By some writers this lady is called Maud, and by others Adele or Adela. The name of her mother is not mentioned. Richard was the son of an English mistress, who is called "the widow of Anskill, a nobleman that lived near the monastery of Abingdon."

numbers leaped into it at the same time as the lady, that it was upset or swamped, and all in it perished. The ship also went down with all on board. Only two men escaped by rising and clinging to the main-yard, which floated, and was probably detached from the wreck: one of these was a butcher of Rouen, named Berold, the other a young man of higher condition, named Godfrey, the son of Gilbert de l'Aigle. Fitz-Stephen, the unfortunate captain, seeing the heads of two men clinging to the yard, swam towards them. "And the king's son," said he, "what has happened to him?" "He is gone! neither he, nor his brother, nor his sister, nor any person of his company, has appeared above water." "Woe to me," cried Fitz-Stephen; and then plunged to the bottom. The night was cold, and the young nobleman, the more delicate of the two survivors, became exhausted, and after holding on for some hours let go the yard, and, recommending his poor companion to God's mercy, sunk to the bottom of the sea. The butcher of Rouen, the poorest of all those who had embarked in the White Ship, wrapped in his sheep-skin coat,* held on till morning, when he was seen from the shore, and saved by some fishermen, who took him into their boat; and from him, being the sole survivor, the circumstances of the fearful event were learned. The tidings reached England in the course of the following day, but no one would venture on communicating them to the king. For three days the courtiers concealed the fact, and at last they sent in

DEATH OF PRINCE WILLIAM AND HIS SISTER.—RIGAUD.

a little boy, who, weeping bitterly with "no counterfeit passion," fell at his feet, and told him that the White Ship was lost, and that all on board had perished. The hard heart of Henry was not proof to this shock,—he sunk to the ground in a swoon; and though he survived it many years, and indulged again in his habitual ambition, he was never afterwards seen to smile.* The English people were far indeed from partaking in this grief; and if half that is related of him be true, they were well rid of a flagitious and tyrannical prince. He had none of the qualities or English feelings of his Saxon mother, the excellent Maud; and he had even been heard to threaten that, when he became king, he would make the English natives draw the plough, and treat them like beasts of burden. The old chroniclers considered his tragic fate as an act of divine vengeance,—as a just judgment of the Almighty; and they thought this notion was strengthened by the circumstances of the wreck, which happened in no storm or tempest, but in serene weather, and on a tranquil sea.† They recalled the threat of the arrogant youth, and his designs against the English people. Henry of Huntingdon exclaims, "He was thinking of his future reign and greatness; but God said it shall not be thus, thou impious, it shall not be; and it so fell out that his brow, instead of being girded with the crown of gold, was beaten against the rocks of the ocean." The horrid accusations made against Rufus and his courtiers are renewed against Prince William and his associates by a startling if not convincing number of contemporary writers; and we fear no historical scepticism or charity can remove the doubt of his having been a dissolute and depraved youth.

As Henry was now deprived of his only legitimate son, he was cast upon new plans for the securing of his various states in his family. At the same time, the same event seemed to brighten the prospects of his nephew, William of Normandy, whose friends certainly increased soon after the demise of the heir apparent. A circumstance connected with the marriage of the drowned prince hastened and gave a colour of just resentment to one declaration in favour of Fitz-Robert. His former friend Fulk, Earl of Anjou, demanded back from Henry his daughter Matilda, together with the dower he had given to Prince William. King Henry willingly gave up the young lady,‡ but refused to part with the money; and upon this, Fulk, who was an adept in these matters, renewed his matrimonial negotiations with the son of Duke Robert, and finally affianced to him his younger daughter Sibylla, putting him, meanwhile, in possession of the earldom of Mons. Louis of France continued to favour the young prince, and some of the most powerful of the Norman barons entered into a conspiracy in his favour against his unkind uncle Henry. But no art,—no precaution, could conceal these manœuvres from the English king, who had spies everywhere, and who fell like a thunderbolt among the Norman lords before they were prepared. It cost him, however, more than a year to subdue this revolt; but then he made the Norman leaders of it prisoners, and induced the Earl of Anjou once more to abandon the cause of his intended son-in-law.

Some time before effecting this peace, Henry, in the vain hope of offspring, which he thought must destroy the expectations of his nephew, espoused Adelais, or Alice, daughter of Geoffrey, Duke of Louvain, and niece to the reigning pope, Calixtus II. This new queen was young, and very beautiful, but the marriage was not productive of any issue; and after three or four years had passed, the king formed the bold design of settling the crown of England and the ducal coronet of Normandy on his daughter Matilda, who had become a widow in 1124, by the death of her husband, the Emperor Henry V. We call this design a bold one, because it was opposed to the customs and feelings then prevalent in all Europe, and most especially so in our country and the neighbouring continental states, where a female reign was unknown, and a *she*-king regarded as a preposterous anomaly degrading to the warlike nobles and the chivalry that propped the throne. Accordingly, at the first blush of the business, the Anglo-Norman barons expressed their astonishment and disgust; but Henry's power was now so absolute in England, that they durst not then venture to oppose it; and he purchased the acquiescence of the most formidable among them, with money, lands, and promises.

On the solemn day of Christmas (A.D. 1126) there was a general assembly in Windsor Castle, of the bishops, abbots, barons, and all the great tenants of the crown, who, for the most part acting against their inward conviction, *unanimously* declared the ex-empress Matilda to be the next heir to the throne, in the case (now not problematical) of her father's dying without legitimate male issue. They then swore to maintain her succession—the clergy swearing first, in the order of their rank, and after them the laity, among whom there seems to have been more than one dispute touching precedence.* The most remarkable of these disputes, as being an index to hidden aspirations, was that for priority between Stephen, Earl of Boulogne, and Robert, Earl of Gloucester. Stephen was the king's nephew, by the daughter of the Conqueror, Henry's sister, Adela: Robert, on the other side, was the king's own son, but was of illegitimate birth; and the delicate point to be decided was, whether precedence was due to legitimacy of birth or to nearness of blood—or, in other words, which of the two—the lawfully begotten nephew of a king, or the unlawfully begotten son of a king—

* David, king of Scotland, in his quality of English earl, or holder of lands in England, swore first *of all* to support Matilda, who was his own niece.

was the greater personage. The shade of the great Conqueror might have been vexed at such a discussion; but though the reigning family derived its claim from a bastard, the question was decided by the assembly in favour of the nephew, Stephen, who accordingly swore first. The question had not arisen out of the small spirit of courtly form and etiquette; the disputants had higher objects. They contemplated perjury in the very preliminary of their oaths. Feeling, in common with every baron present at that wholesale swearing, that the succession of Matilda was insecure, they both looked forward to the crown; and on that account each was anxious to be declared the first prince of the blood.

The same year that brought Matilda to England, saw Fulk, the Earl of Anjou, depart for the Holy Land, it being his destiny to become a very indifferent king of Jerusalem. Having marked the sign of the sacred cross on his shield, his helmet, and other arms, as also on his saddle and the bridle-rein of his horse,* he renounced the government of the province of Anjou to his son Geoffrey, surnamed *Plantagenet*, on account of a custom he had of wearing a sprig of flowering broom† in his cap like a feather. Henry had many times felt the hostile power of the earls of Anjou, and various political considerations induced him to conclude a marriage between his daughter Matilda and Geoffrey, the son of Fulk. The ex-empress, though partly against her liking, consented to the match, which was negotiated and concluded with great secrecy. The barons of England and Normandy pretended that the king had no right thus to dispose of their future sovereign without previously consulting them; they were generally dissatisfied with the proceeding, and some of them openly declared that it released them from the obligations of the oath they had taken to Matilda. This argument was made more cogent when death relieved them from the dread of the power and ability of Henry, who disregarded their present murmurs, and congratulated himself on his policy, which united the interests of the house of Anjou with those of his own. The marriage was celebrated at Rouen, in the octaves of the feast of Whitsuntide, 1127, and the festival was prolonged during three weeks. Henry, somewhat despotically, ordered everybody to be merry. On the first day, heralds, in full costume, went through the streets and squares, crying this singular proclamation: "In the king's name, let no man here present, whether an inhabitant or a stranger, rich or poor, noble or *vilain*, be so bold as to withdraw himself from the royal rejoicings; for, whosoever taketh not part in the diversions and games will be held guilty of an offence towards his lord the king."‡

But rejoice as he might, Henry felt that the succession of his daughter could never be secure, if his nephew survived him; and he applied himself with all his craft to effect the ruin of that young man, who, at the moment, occupied a position that made him truly formidable. At the late peace, the French king had not abandoned his interests like Fulk, the earl of Anjou; on the contrary, Louis invited him again to his court, and soon after, in lieu of Sibylla of Anjou, gave him the hand of his queen's sister, and with her, as a portion, the countries of Pontoise, Chaumont, and the Vexin, on the borders of Normandy. Soon after this advantageous settlement, Charles the Good, earl of Flanders, successor to Baldwin, the steady friend of the son of Duke Robert, was murdered in a church at the very foot of the altar. The king of France entered Flanders as liege lord, and with the consent of the people, to punish the sacrilegious murderers; and having done this, he, in virtue of his feudal suzerainty, conferred the earldom upon William of Normandy, who had accompanied him in the expedition, and who, had such claims been allowed, had a good hereditary right to it as the representative of his grandmother, Matilda, who was daughter of Earl Baldwin of the old legitimate line. The Flemish people offered no opposition to their new earl; and King Louis, with his army, departed, in the gratifying conviction that he had secured a stable dominion to his gallant young brother-in-law, and placed him in a situation the most favourable for the conquest of Normandy, or at least for the curbing of that ambition in the English king, which continued to give uneasiness to Louis. This uneasiness could not fail of being increased by the union between the Norman line and the house of Anjou, which took place at this very time. But the French army had scarcely left the country, when the Flemish people, distinguished even in that age by their turbulence, broke out into revolt against their new earl, and asked and received assistance from King Henry. A respectable party, however, adhered to William, who had many qualities to ensure respect and love. In the field he had a manifest advantage over the ill-directed insurgents, who then invited Thiedrik, or Thierry, landgrave of Alsace, to put himself at their head. Thierry gladly accepted their invitation. He advanced a claim to the succession on the ground of his descent from some old chief of the country; and Henry, who found in him the instrument he wanted, sent him money, and engaged to support him with all his might. The treacherous surrender of Lisle, Ghent, and other important places in Flanders, immediately followed; but William, who had the courage and military skill of his unfortunate father, without any of his indolence, completely defeated his antagonist, Thierry, under the walls of Alost. Most unfortunately, however, in the moment of victory, he received a pike wound in the hand, and this being neglected, or improperly treated by ignorant surgeons, brought on a mortification. He was conveyed to the monastery of St. Omer, where he died on the 27th of July, 1128, in the twenty-sixth

year of a life which had been subject to extraordinary vicissitudes. In his last moments, he wrote to his unnatural uncle, to implore mercy for the Norman barons who had followed his fortunes. Henry, in the joy of his heart, granted the request of his deceased nephew, who left no children to prolong the king's inquietude, or serve as a rallying point to the disaffected nobles. We are not informed whether the tidings of William's brief greatness were conveyed into the dungeon of Cardiff Castle, to solace the heart of his suffering father, or whether the news of his early death, which so soon followed it, was in mercy concealed from the blind old man.

To work out his purposes, Henry had hesitated at no treachery, no bloodshed, no crime, and yet the infatuated man fondly hoped to end his days in tranquillity. The winding up of his story is little more than a succession of petty family jars and discords—the very bathos of ambition and worldly grandeur. His daughter Matilda, presuming on the imperial rank she had held, and being naturally of a proud, imperious temper, soon quarrelled with her husband: a separation took place; Matilda returned to England, and her father was occupied during many months with these family disputes, and in negotiating a peace between man and wife. At length, a reconciliation was patched up, and Matilda returned to her husband. The oath-breaker, her father, thought he could never exact oaths enough from others; and before his daughter left England, he made the prelates and barons again swear fealty to her. Henry, who, in spite of these precautions, well knew the chances to which Matilda would be exposed, ardently longed for a grandson, whom he hoped to see grow up; but for six years he was kept uneasy and unhappy by the unfruitfulness of the marriage. In March, 1133, however, Matilda was delivered, at Mans, of her first child, Henry, styled Fitz-Empress, who was afterwards Henry II. of England. At the birth of this grandson the king again convoked the barons of England and Normandy, and made them recognise as his successors the children of his daughter, after him, and *after her*. The nobles consented in appearance, and, being accustomed to the taking of oaths which they meant to break, swore fealty afresh, not only to Matilda, but to her infant son, and the rest of her progeny as yet unborn. The ex-empress gave birth to two more princes, Geoffrey and William, in the course of the two following years; but even a growing family failed to endear her husband to her: she quarrelled with him on all possible occasions; and as her father took her part, whether right or wrong, she kept his mind almost constantly occupied with their dissensions. Under these circumstances, it was not natural that Geoffrey Plantagenet should prove a loving and dutiful son-in-law: he demanded immediate possession of Normandy, which he said Henry had promised him; and when the king refused, he broke out into threats and insults. Matilda, it is said, exerted her malignant and ingenious spirit in widening the breach between her own husband and father. The four last years of Henry's reign, which were spent wholly abroad, were troubled with these domestic broils. At length an incursion of the Welsh demanded his presence in England; and he was preparing for that journey, when death despatched him on a longer one. His health and spirits had been for some time visibly on the decline. On the 25th of November, "to drive his grief away, he went abroad to hunt." Having pursued his sport during the day, in the woods of Lions-la-Forêt, in Normandy,* he returned home in the evening "somewhat amended," and, being hungry, "would needs eat of a lamprey, though his physician ever counselled him to the contrary." The lamprey or lampreys he ate brought on an indigestion; and the indigestion a fever: on the third day, despairing of his recovery, he sent for the Archbishop of Rouen, who administered the sacrament and extreme unction; and, on the seventh day of his illness, which was Sunday, December 1, A.D. 1135, he expired at the midnight hour. He was in his sixty-seventh year, and had reigned thirty-five years and four months, wanting four days. By his will he left to his daughter Matilda and her heirs for ever, all his territories on either side the sea; and he desired that when his lawful debts were discharged, and the liveries and wages of his retainers paid, the residue of his effects should be distributed among the poor. He seems to have died in anger with his son-in-law, for the name of Geoffrey Plantagenet was not mentioned in his will. They kept the royal bowels in Normandy, and deposited them in the church of St. Mary, at Rouen, which his mother had founded; but the body was conveyed to England, and interred in Reading Abbey, which Henry had built himself.

The best circumstances attending his long reign were, the peace he maintained in England, and a partial respect to the laws which his vigorous government imposed on his haughty and ferocious barons. If regard is had only to success, and no attention paid to the wickedness of the means, he was certainly a great politician. Considering the times, extraordinary care had been taken of his education: his natural abilities were excellent; and so great was his progress in the philosophy and literature of the age, that his contemporaries honoured him with the name of Beau-clerc, or the fine scholar. Henry of Huntingdon, who knew him well, calls him the murderer of many men, the violator of his oaths; and regards him as one of those princes who cause royalty to be considered as a crime. The same contemporary writer has left us his character as differently painted by his friends and by his enemies. According to the first,

* Lions-la-Forêt, now a town, is at a short distance from Rouen, and is approached through the remains of a forest, to which it owes its surname. To this forest, once of great extent, the Norman princes eagerly resorted for the diversion of the chase. So early as 929, William I., duke of Normandy, built a hunting-box there, which afterwards became a castle important from its strength. The forest was the scene of many of the adventures recorded in the old chronicles and romances.—Tour in Normandy, by Gally Knight, Esq.

RUINS OF READING ABBEY, the Burial Place of Henry I., as they appeared in 1721.

he was commendable for the three glorious qualities of wisdom, valour, and wealth; according to the latter, he was to be condemned for the three especial vices of covetousness, cruelty, and lust. If we unite the good and the evil, and add the qualities of craft, treachery, and an implacable revenge, we shall come to a pretty just estimate of his moral worth.
